V. Spherical Shell Displacements

To find the displacement in the direction of the load due to a unit load applied at the quadrants of a quarter of a spherical shell.

Reference

MacNeal, R.H. and Harder, R.C., *A Proposed Standard Set of Problems to Test Finite Element Accuracy, Finite Element in Analysis and Design 1*, 1985.

Problem

For the quarter of a spherical shell find the displacement in the direction of the load.

$E = 6.825(10)^7$ psi

Poisson's ratio = 0.3

t = 0.04 inches

r = 10 in.

Unit forces on quadrants

Boundary conditions:

Vertical restraint at center of free edge
Symmetry defines boundary conditions

V. Thermal Load on a Plate

Find deflections and moments due to thermal loading and compare theoretical answers to the STAAD solution.

Reference

Timoshenko, S., and Woinowsky-Krieger, S., *Theory of Plates and Shells*, Second Edition, McGraw-Hill, 1959, pages 162 - 165.

Problem

A rectangular plate is simply supported on all four sides. The transverse and longitudinal bending moments as well as the deflections at several points on the plate are computed.

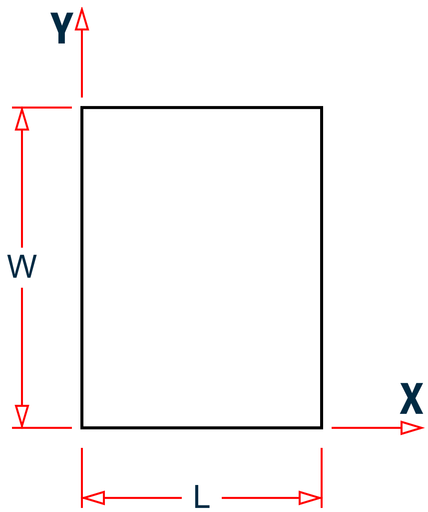

Figure 417: Rectangular plate model

L = 12 in., W = 16 in.

The plate is modeled using 1 in. X 1 in. size elements. At the corner nodes, all the degrees of freedom are considered restrained. For the nodes along the four edges, rotation is permitted about that edge.

Theoretical Solution

From the Reference, equation (j), the expression for deflection normal to the plate surface is:

$$w = -\frac{at(1+\nu)4a^2}{\pi^3 h}\sum_{m=1,3,5\ldots}^{\infty}\frac{\sin\frac{m\pi x}{a}}{m^3}\left(1-\frac{\cosh\frac{m\pi y}{a}}{\cosh a_m}\right)$$

where

$$a_m = \frac{m\pi b}{2a}$$

From the Reference, equation (k), the expressions for bending moment per unit width are

$$M_x = \frac{4Dat(1-\nu^2)}{\pi h}\sum_{m=1,3,5\ldots}^{\infty}\frac{\sin\frac{m\pi x}{a}\cosh\frac{m\pi y}{a}}{m\cdot\cosh a_m}$$

$$M_y = \frac{at(1-\nu^2)D}{h} - \frac{4Dat(1-\nu^2)}{\pi h}\sum_{m=1,3,5\ldots}^{\infty}\frac{\sin\frac{m\pi x}{a}\cosh\frac{m\pi y}{a}}{m\cdot\cosh a_m}$$

where

a	=	Coefficient of Thermal Expansion
t	=	Difference between the temperatures of the upper and lower surfaces of the plate
ν	=	Poisson's ratio
h	=	Plate thickness
a	=	Dimension of the plate along the x1 axis
b	=	Dimension of the plate along the x2 axis
E	=	Elastic Modulus
D	=	$Eh^3/[12(1 - \nu^2)$

The numerical values used for this example are:

$\alpha = 12.0E\text{-}06$ / °F
$t = 450$ °F
$\nu = 0.3$
$h = 0.3$ in.
$a = 12$ in.
$b = 16$ in.
$E = 10.0E6$ psi

V. Warped Surface Displacements

To find the displacements at the free end of a warped cantilever plate due to in-plane load and out of plane loads.

Reference

MacNeal, R.H. and Harder, R.C., *A Proposed Standard Set of Problems to Test Finite Element Accuracy, Finite Element in Analysis and Design 1*, 1985.

Problem

The finite element model is as shown below: Find the displacements at the tip in the direction of the loads. Loading is unit forces at the free end: in plane and out of plane.

E = 29,000.0 ksi.

L = 12.0 in.

B = 1.1 in.

t = 0.22 in.

Twist = 90° (root to tip)

Poisson's ratio = 0.22

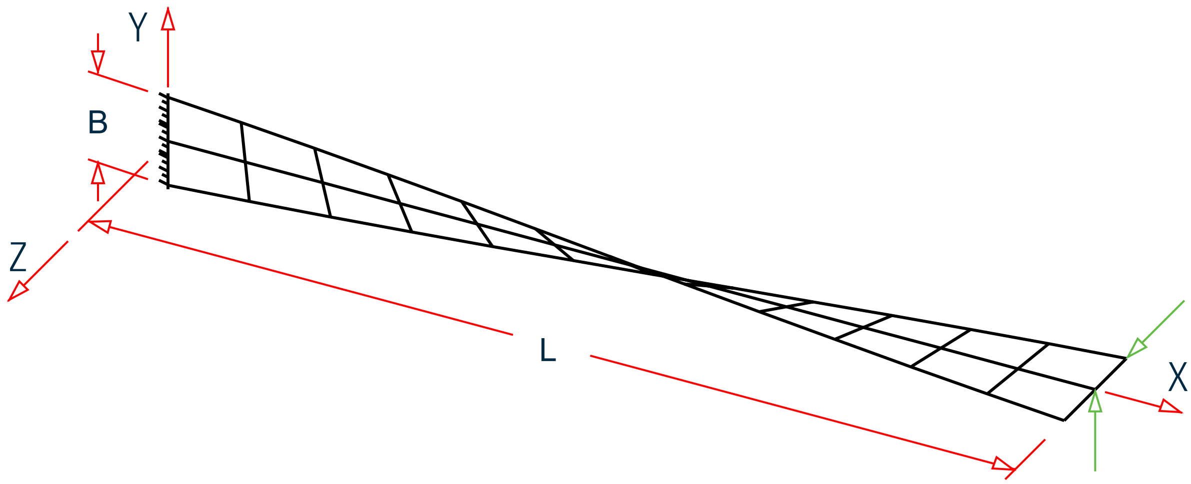

Figure 418: Model of warped, cantilever plate

Comparison

Table 443: Comparison of results

Result Type	Theory	STAAD.Pro	Difference	Comments
δ due to in-plane load (in)	$5.424(10)^{-3}$	$5.590(10)^{-3}$	3.1%	Instead of using triangular element, a more advanced element type could to be used. Also the mesh size could be reduced to get closer result in comparison the theoretical value.
δ due to out-of-plane load (in)	$1.754(10)^{-3}$	$1.950(10)^{-3}$	11.2%	

STAAD Input

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\04 Plates Shells\Warped Surface Displacements.STD` is typically installed with the program.

V.05 Solids

V. Cantilever Beam End Displacement 1

To find the displacement at the free end of a cantilever beam modeled with solid elements.

Reference

Hand calculation.

Problem

Calculate the maximum displacement of a cantilever beam due to a concentrated load at the free end

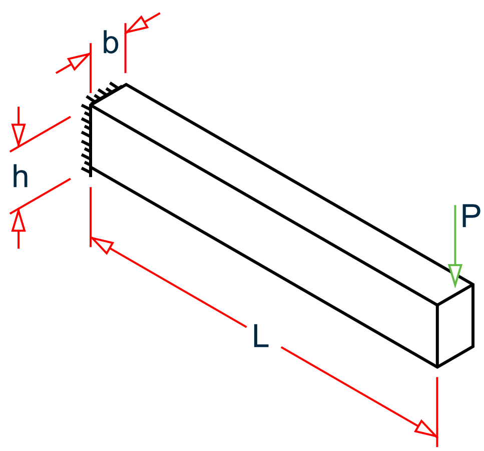

Figure 419: Entire model

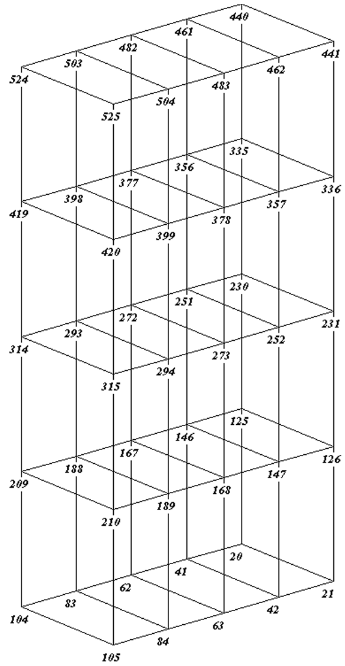

Figure 420: Free end section with node numbers

L = 10 in

A = 2 in^2

P = 300 lb

l = 2/3 in.^{4}

E = 29,000 ksi

v = 0.3

Hand Calculation

$\delta_{bend} = PL^3/(3EI) = 300(10)^3/\{3[29(10)^6](2/3)\} = 0.00517$ in

$\delta_{shear} = 12/5*(1+v)PL/AE = 12/5*(1+0.3)(300)(10)/[29(10)^6(2)] = 0.00016$ in

$\delta = \delta_{bend} + \delta_{shear} = 0.00517 + 0.00016 = 0.00533$ in

Comparison

Table 444: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Deflection, δ, (in)	0.00533	0.00529	< 1.0%

STAAD Input

V. Cantilever Beam End Displacement 2

To find the displacement at the free end and normal stresses at mid-span of a cantilever beam modeled with solid elements.

Hand Calculation

Displacement due to Load 1:

$$\delta_{LL} = \frac{PL}{AE} = \frac{1,\ 200(15)}{10 \times (10)^6(6)} = 0.0003 \text{ in}$$

Rotate due to Load 2:

$$\varphi_{L2} = TL/(c_2ab^3G)$$

where

a	=	long side of the cross section = 3 in
b	=	short side of the cross section = 2 in
$c2$	=	0.1958 for $a/b = 1.5$
G	=	$E/[2(1+v)] = 10(10)^3/(2(1+0.3)] = 3,846$ ksi

$$\varphi_{L2} = 2000(15)//[0.1958(3)(2)^3 3.846(10)^6] = 0.00166 \text{ rad}$$

Displacement due to Load 3:

$$\delta_{L3} = ML^2/(2EI) = 2500(15)^2/[2(10)(10)^7(4.5)] = 0.00625 \text{ in}$$

Displacement due to Load 4:

$$\delta_{bend} = PL^3/(3EI) = 1000(15)^3/\{3[10(10)^6](4.5)\} = 0.025 \text{ in}$$

$$\delta_{shear} = 12/5*(1+v)PL/AE = 12/5*(1+0.3)(1000)(15)/[(6)10(10)^6] = 0.00078 \text{ in}$$

$$\delta_{L4} = \delta_{bend} + \delta_{shear} = 0.025 + 0.00078 = 0.02578 \text{ in}$$

Stress at midspan due to Load 1:

$$\sigma_a = P/A = 1200/6 = 200 \text{ psi}$$

Stress at midspan due to Load 3:

$$\sigma_b = My/I = 2500(1.5)/4.5 = 833.33 \text{ psi}$$

Stress at midspan due to Load 4:

$$\sigma_b = My/I = 7.5(1000)(1.5)/4.5 = 2,500 \text{ psi}$$

Comparison

Table 445: Comparison of results

Result Type		Theory	STAAD.Pro	Difference	Comments
Maximum Displacement, δ (in)	LC1	0.00030	0.00033	10%	The theoretical results from classical Beam theory was compared with the results from the model with Solid Elements - hence the difference in results.
	LC3	0.00625	0.00621	0.6%	
	LC4	0.02578	0.02537	1.6%	
Maximum Rotation, φ (rad)	LC2	0.00166	0.00149	10.2%	
Normal Stress at Midspan* (psi)	LC1	200.0	200.004	none	
	LC3	833.3	833.325	none	
	LC4	2,500	2,630.409	5.2%	

Note: (*) Stresses computed at Node no. 32 of solid no. 10.

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\05 Solids\Cantilever Beam End Displacement 2.STD` is typically installed with the program.

V.06 Loading

V. EN 1998-1-2004

V. EN 1998-1-2004 Response Spectrum

Calculation of base shear for response spectrum method per EN 1998-1-2004.

Details

A three story building is modelled in STAAD.Pro considering the following:

Type 1
Ground type A
Soil factor, S = 1
Lower limit of period, T_B = 0.15 sec
Upper limit of period, T_C = 0.4 sec
Value defining the beginning of constant displacement response range, T_D = 2 sec
Damping: 5%
Design ground acceleration, a_g = 0.981 m/sec^2
Damping correction factor, η = 1
Behavior factor, q = 3
Lower bound factor for horizontal design spectrum, β = 0.2

The generated model is subjected to a Response Spectrum Load along global X direction. The base shear reported by STAAD.Pro is verified against hand calculation.

Validation

V. GB 50011

V. GB 50011 2010 Response Spectrum

Calculation of base shear and for response spectrum method in GB 50011-2010.

Details

A three story building is modelled in STAAD.Pro considering the following:

Classification of seismic design = Group 2
Design seismic intensity = 8
Site class = II
Damping = 3.5%

The seismic weight of 420 kN applied as a joint weight of 70 kN to the joints at each floor (joints 2, 3, 4, 6,7, and 8); or 140 kN at each story above ground.

The generated model is subjected to a response spectrum load along global X direction. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Natural Frequency/Time Period Information & Mode Shapes (Obtained from output file)

Table 451: Natural Frequencies/Time Period

Mode	Frequency (cyc/sec)	Time Period (sec)
1	1.114	0.897
2	3.122	0.320
3	4.512	0.222

Table 452: Mode Shapes

Mode	Story Level/Joint Numbers	X-Trans	Y-Trans	Z-Trans	X-Rot	Y-Rot	Z-Rot
1	Roof/Joints 4 & 8	1	0	0	0	0	0
	2nd Floor/Joints 3 & 7	0.802	0	0	0	0	0

<u>Horizontal Acceleration Spectrum Value</u>

The max value of horizontal seismic influence, $a_{max} = 0.16$.

The characteristic period, $T_g = 0.4s$.

The damping ratio, $\zeta = 0.035$.

The power index of the curvilinear decrease section:

$$= 0.9 + \frac{0.05 - \zeta}{0.3 + 6\zeta} = 0.929$$

The damping adjustment factor is determined as:

$$\eta_2 = 1 + \frac{0.05 - \zeta}{0.08 + 1.6\zeta} = 1.11$$

	Mode 1	Mode 2	Mode 3
Time Period T	0.897 (Tg<T<5Tg)	0.320 (0.1<T < Tg)	0.222 (0.1<T < Tg)
Formula	$a = \left(\frac{T_g}{T}\right)^{\gamma} \eta_2 a_{max}$	$a = \eta_2 a_{max}$	$a = \eta_2 a_{max}$

<tr><td colspan="2">Base shear</td><td colspan="3">32.197</td><td colspan="3">5.581</td><td colspan="3">0.823</td></tr>
</table>

Summation by SRSS:

$$\sqrt{(32.197)^2 + (5.581)^2 + (0.823)^2} = 32.69$$

Comparison

Table 454: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Base shear (kN)	32.69	32.67	negligible	

Note: The complete quadratic combination method (CQC) in STAAD.Pro gives essentially the same value as the calculation above, as well: 32.69 kN.

V. GB 50011-2001 Static Seismic - Case1

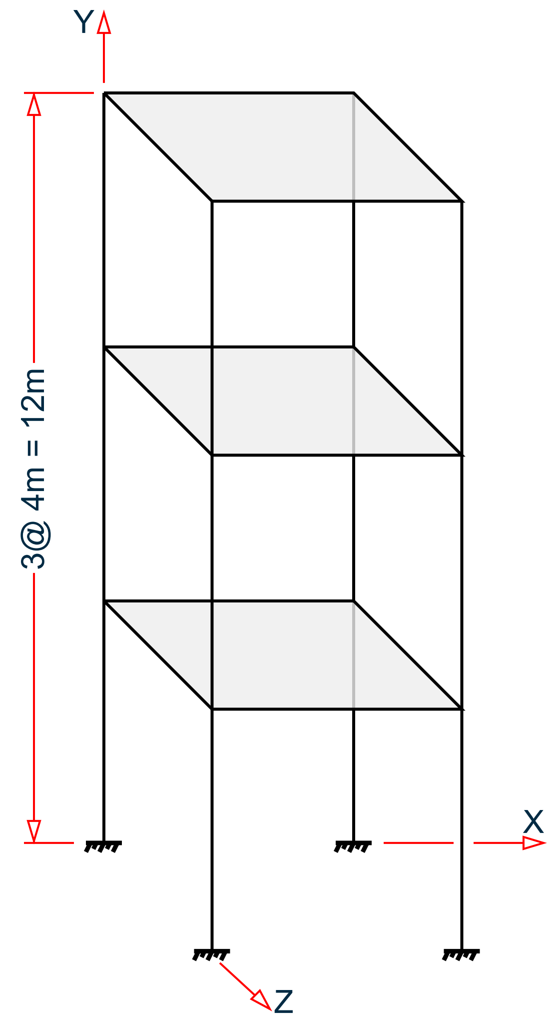
Calculate the base shear and its distribution along the height using the equivalent lateral force method in GB 50011-2001 using the default equivalent gravity load factor for horizontal seismic action.

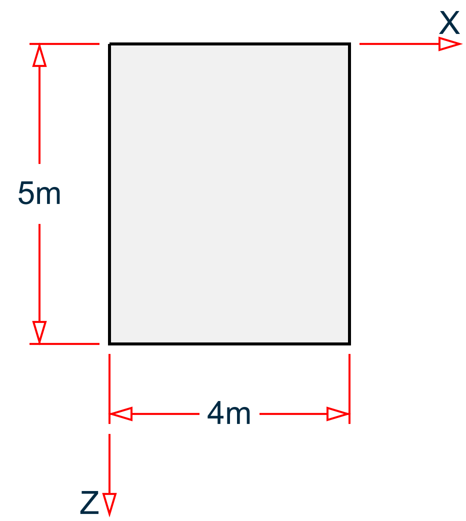
Details

Structure to be modelled:

height = 3× 4m = 12m
plan dimension X = 4m

plan dimension Z = 5m





Input parameters:

Frequency of seismic event: Frequent
Classification of seismic design: Group 2
Seismic design intensity: 8
Site class: II
Period in the X direction: $T = 0.467s$
Equivalent gravity load factor for horizontal seismic action: 0.85 (default in STAAD.Pro)
Damping ratio, $\zeta = 0.05$ (default in STAAD.Pro)

The section of all members is HW300X300, and the seismic weight for each floor is assumed as 280 kN applied as joint weight of 70 kN to nodes 2, 3, 5, 6, 8, 9, and 11 to 16. S

Validation

The effective weight of the structure:

$$G_{Eq} = 0.85 \times 280 \text{ kN} \times 3 \text{ floors} = 714 \text{ kN}$$

The max value of the horizontal seismic influence for a “frequent” earthquake with intensity of 8, $a_{max} = 0.16$ (Table 5.1.4-1)

The characteristic period, $T_g = 0.4s$ (Table 5.1.4-2)

The power index of the curvilinear decrease section:

$$\gamma = 0.9 + \frac{0.05 - \zeta}{0.5 + 5\zeta} = 0.9$$

The damping adjustment factor:

$$\eta_2 = 1 + \frac{0.05 - \zeta}{0.06 + 1.7\zeta} = 1.0$$

$$T_g < T < 5T_g$$

The horizontal seismic influence coefficient corresponding to the fundamental period of the structure:

$$a_1 = \left(\frac{T_g}{T}\right)^{\gamma} \eta_2 \times a_{max} = \left(\frac{0.4}{0.467}\right)^{0.9} 1.0 \times 0.16 = 0.139$$

The characteristic value of the total horizontal seismic action of the structure:

$$F_{Ek} = a_1 \times G_{Eq} = 0.139 \times 714 = 99.25 \text{ kN} \tag{Eq. 2.5}$$

$$T = 0.467 < 1.4T_g = 0.56$$

Additional seismic action factors at the top of the building $\delta_n = 0$

Additional horizontal seismic action applied at top of the building $\Delta F_n = \delta_n \times F_{Ek} = 0$

Characteristic value of horizontal seismic action applied at the i[th] mass:

$$F_i = \frac{G_i H_i}{\sum_{j=1}^{n} G_j H_j} F_{Ek}(1 - \delta_n)$$

Story Level	G_i (kN)	H_i (m)	G_iH_i (kN·m)	$G_iH_i / \Sigma G_iH_i$	F_i (kN)	ΔF_n (kN)	V_i (kN)

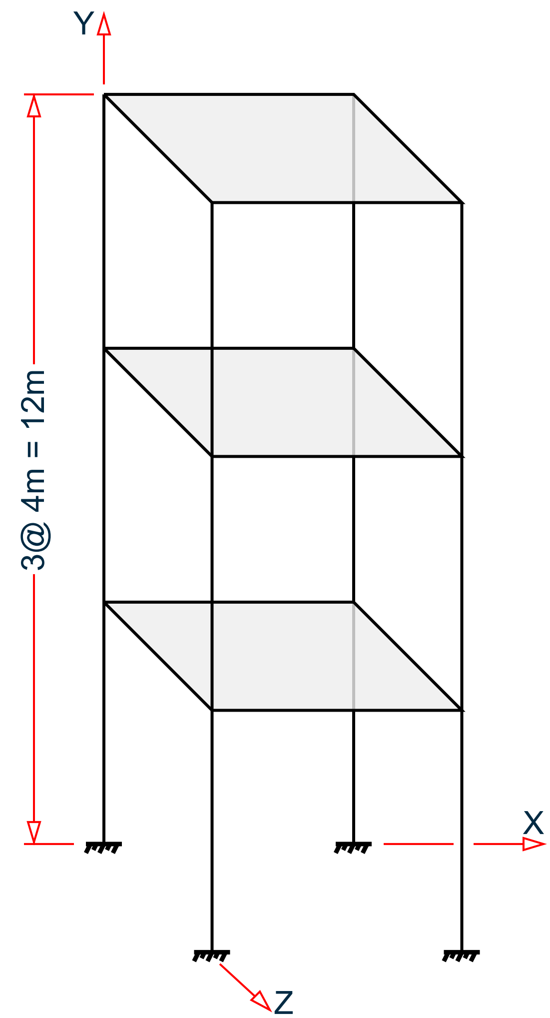
V. GB 50011-2001 Static Seismic - Case2

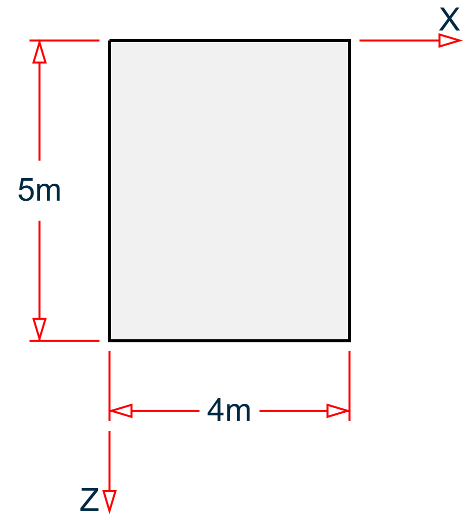
Calculate the base shear and its distribution along the height using the equivalent lateral force method in GB 50011-2001 using a equivalent gravity load factor for horizontal seismic action of 1.0.

Details

Structure to be modelled:

height = 3× 4m = 12m
plan dimension X = 4m
plan dimension Z = 5m





Input parameters:

Frequency of seismic event: Frequent
Classification of seismic design: Group 2
Seismic design intensity: 8
Site class: II
Period in the X direction: $T = 0.467s$
Equivalent gravity load factor for horizontal seismic action: 1.0
Damping ratio, $\zeta = 0.05$ (default in STAAD.Pro)

The section of all members is HW300X300, and the seismic weight for each floor is assumed as 280 kN applied as joint weight of 70 kN to nodes 2, 3, 5, 6, 8, 9, and 11 to 16. S

Validation

The effective weight of the structure:

$$G_{\mathrm{Eq}} = 1.0 \times 280 \text{ kN} \times 3 \text{ floors} = 840 \text{ kN}$$

The max value of the horizontal seismic influence for a “frequent” earthquake with intensity of 8, $a_{max} = 0.16$ (Table 5.1.4-1)

The characteristic period, $T_g = 0.4s$ (Table 5.1.4-2)

The power index of the curvilinear decrease section:

$$\gamma = 0.9 + \frac{0.05 - \zeta}{0.5 + 5\zeta} = 0.9$$

The damping adjustment factor:

$$\eta_2 = 1 + \frac{0.05 - \zeta}{0.06 + 1.7\zeta} = 1.0$$

$$\mathrm{T_g} < \mathrm{T} < 5\mathrm{T_g}$$

The horizontal seismic influence coefficient corresponding to the fundamental period of the structure:

$$a_1 = \left(\frac{T_\mathrm{g}}{T}\right)^\gamma \eta_2 \times a_\mathrm{max} = \left(\frac{0.4}{0.467}\right)^{0.9} 1.0 \times 0.16 = 0.139$$

The characteristic value of the total horizontal seismic action of the structure:

$$F_\mathrm{Ek} = a_1 \times G_\mathrm{Eq} = 0.139 \times 840 = 116.76 \text{ kN} \qquad \text{(Eq. 2.5)}$$

$$\mathrm{T} = 0.467 < 1.4\mathrm{T_g} = 0.56$$

Additional seismic action factors at the top of the building $\delta_n = 0$

Additional horizontal seismic action applied at top of the building $\Delta F_n = \delta_n \times F_{Ek} = 0$

Characteristic value of horizontal seismic action applied at the ith mass:

$$F_i = \frac{G_i H_i}{\sum_{j=1}^{n} G_j H_j} F_{Ek}(1 - \delta_n)$$

Story Level	G_i (kN)	H_i (m)	G_iH_i (kN·m)	G_iH_i/ ΣG_iH_i	F_i (kN)	ΔF_n (kN)	V_i (kN)

- *TR.31.2.5 Chinese Static Seismic per GB50011-2001* (on page 2369)

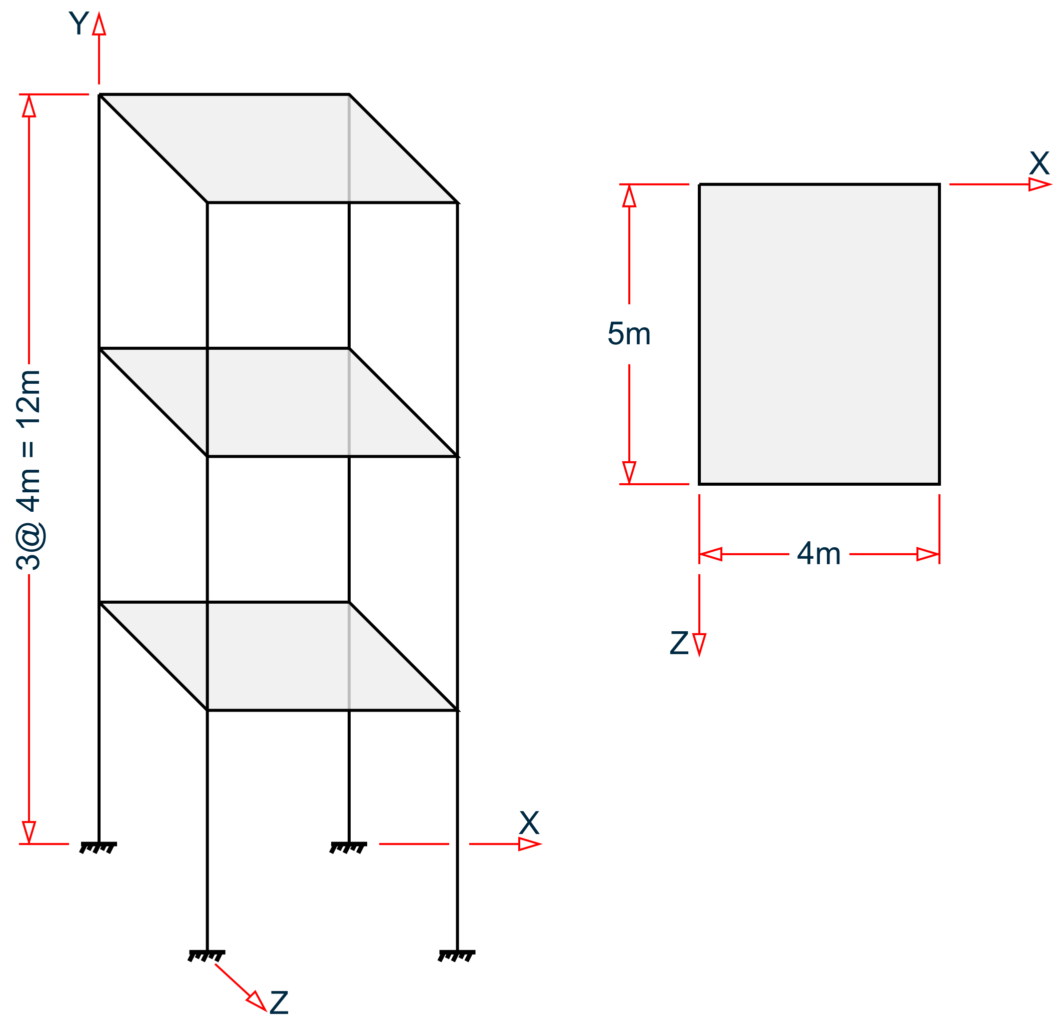
V. GB 50011-2010 Static Seismic - Case1

Calculate the base shear and its distribution along the height using the equivalent lateral force method in GB 50011-2010.

Details

Structure to be modelled:

height = 3× 4m = 12m
plan dimension X = 4m
plan dimension Z = 5m



Input parameters:

Frequency of seismic event: Frequent
Classification of seismic design: Group 2
Seismic design intensity: 8
Site class: II
Equivalent gravity load factor for horizontal seismic action: 0.85 (default in STAAD.Pro)
Damping ratio, $\zeta = 0.05$ (default in STAAD.Pro)

The section of all members is HW300X300, and the seismic weight for each floor is assumed as 280 kN applied as joint weight of 70 kN to nodes 2, 3, 5, 6, 8, 9, and 11 to 16. S

Validation

The effective weight of the structure:

$$G_{\mathrm{Eq}} = 0.85 \times 280\ \mathrm{kN} \times 3\ \mathrm{floors} = 714\ \mathrm{kN}$$

The structure period (as calculated by STAAD.Pro, $T_{calc} = 0.685s$

The max value of the horizontal seismic influence for a “frequent” earthquake with intensity of 8, $a_{max} = 0.16$ (Table 5.1.4-1)

The characteristic period, $T_g = 0.4s$ (Table 5.1.4-2)

The power index of the curvilinear decrease section:

$$\gamma = 0.9 + \frac{0.05 - \zeta}{0.5 + 5\zeta} = 0.9$$

The damping adjustment factor:

$$\eta_2 = 1 + \frac{0.05 - \zeta}{0.06 + 1.7\zeta} = 1.0$$

$$T_g < T < 5T_g$$

The horizontal seismic influence coefficient corresponding to the fundamental period of the structure:

$$a_1 = \left(\frac{T_g}{T}\right)^{\gamma} \eta_2 \times a_{max} = \left(\frac{0.4}{0.685}\right)^{0.9} 1.0 \times 0.16 = 0.099$$

The characteristic value of the total horizontal seismic action of the structure:

$$F_{Ek} = a_1 \times G_{Eq} = 0.099 \times 714 = 70.69 \text{ kN} \quad \text{(Eq. 2.5)}$$

$$T = 0.685 > 1.4T_g = 0.56$$

$$T = 0.35 < T_g < 0.55$$

Additional seismic action factors at the top of the building $\delta_n = 0.08 \times T + 0.01 = 0.065$

Additional horizontal seismic action applied at top of the building $\Delta F_n = \delta_n \times F_{Ek} = 0.065 \times 70.69 = 4.59\ kN$

Characteristic value of horizontal seismic action applied at the ith mass:

$$F_i = \frac{G_i H_i}{\sum_{j=1}^{n} G_j H_j} F_{Ek}(1 - \delta_n)$$

Story Level	G_i (kN)	H_i (m)	G_iH_i (kN·m)	$G_iH_i / \Sigma G_iH_i$	F_i (kN)	ΔF_n (kN)	V_i (kN)

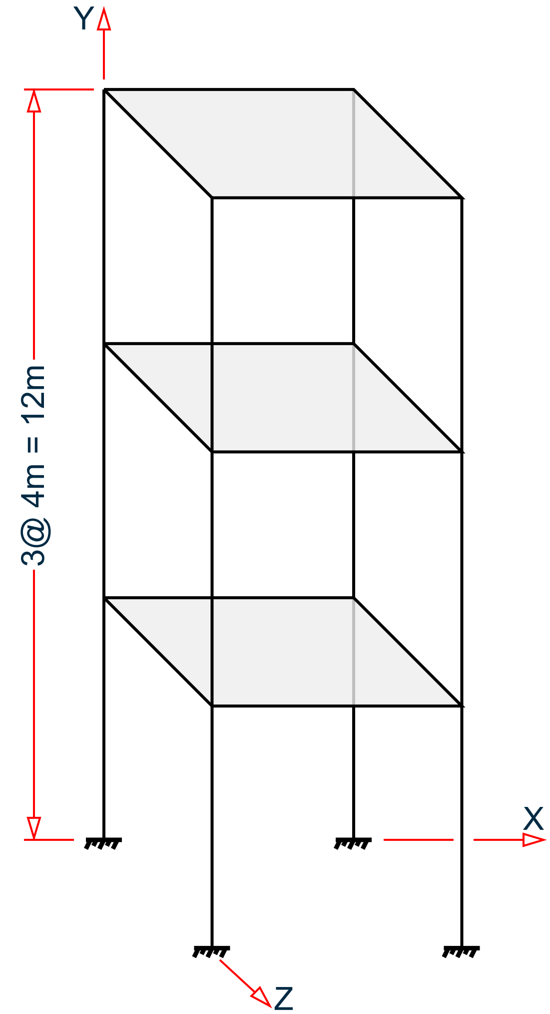
V. GB 50011-2010 Static Seismic - Case2

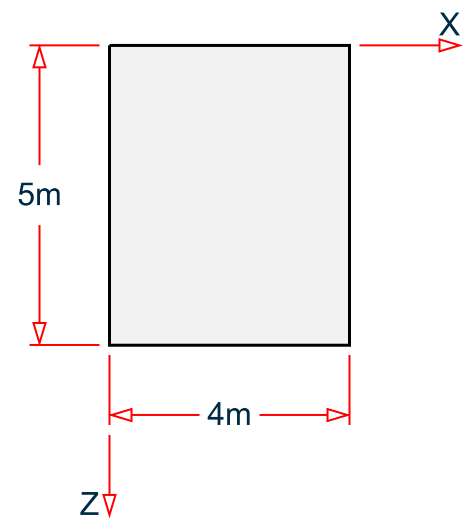
Calculate the base shear and its distribution along the height using the equivalent lateral force method in GB 50011-2010.

Details

Structure to be modelled:

height = 3× 4m = 12m
plan dimension X = 4m
plan dimension Z = 5m





Input parameters:

Frequency of seismic event: Rare
Classification of seismic design: Group 3
Seismic design intensity: 6
Site class: I0
Period in the X direction: $T = 0.40s$
Equivalent gravity load factor for horizontal seismic action: 0.85 (default in STAAD.Pro)
Damping ratio, $\zeta = 0.05$ (default in STAAD.Pro)

The section of all members is HW300X300, and the seismic weight for each floor is assumed as 280 kN applied as joint weight of 70 kN to nodes 2, 3, 5, 6, 8, 9, and 11 to 16. S

Validation

The effective weight of the structure:

$$G_{\mathrm{Eq}} = 0.85 \times 280 \text{ kN} \times 3 \text{ floors} = 714 \text{ kN}$$

The max value of the horizontal seismic influence for a “rare” earthquake with intensity of 6, $a_{max} = 0.28$ (Table 5.1.4-1)

The characteristic period, $T_g = 0.30 + 0.05 = 0.35s$ (Table 5.1.4-2)

The power index of the curvilinear decrease section:

$$\gamma = 0.9 + \frac{0.05 - \zeta}{0.5 + 5\zeta} = 0.9$$

The damping adjustment factor:

$$\eta_2 = 1 + \frac{0.05 - \zeta}{0.06 + 1.7\zeta} = 1.0$$

$$T_g < T < 5T_g$$

The horizontal seismic influence coefficient corresponding to the fundamental period of the structure:

$$a_1 = \left(\frac{T_g}{T}\right)^{\gamma} \eta_2 \times a_{max} = \left(\frac{0.35}{0.4}\right)^{0.9} 1.0 \times 0.28 = 0.248$$

The characteristic value of the total horizontal seismic action of the structure:

$$F_{Ek} = a_1 \times G_{Eq} = 0.248 \times 714 = 177.28 \text{ kN} \qquad \text{(Eq. 2.5)}$$

$$T = 0.4 < 1.4T_g = 0.49$$

Additional seismic action factors at the top of the building $\delta_n = 0$

Additional horizontal seismic action applied at top of the building $\Delta F_n = \delta_n \times F_{Ek} = 0$

Characteristic value of horizontal seismic action applied at the i[th] mass:

$$F_i = \frac{G_i H_i}{\sum_{j=1}^{n} G_j H_j} F_{Ek}(1 - \delta_n)$$

Story Level	G_i (kN)	H_i (m)	G_iH_i (kN·m)	$G_iH_i / \Sigma G_iH_i$	F_i (kN)	ΔF_n (kN)	V_i (kN)

V. IBC / ASCE 7

V. ASCE 7 Geometric Irregularity

Verify geometric irregularity (reentrant corners in plan) check in accordance to the ASCE 7-16 specifications.

Details

A two story structure is modelled with diaphragms at the story levels.

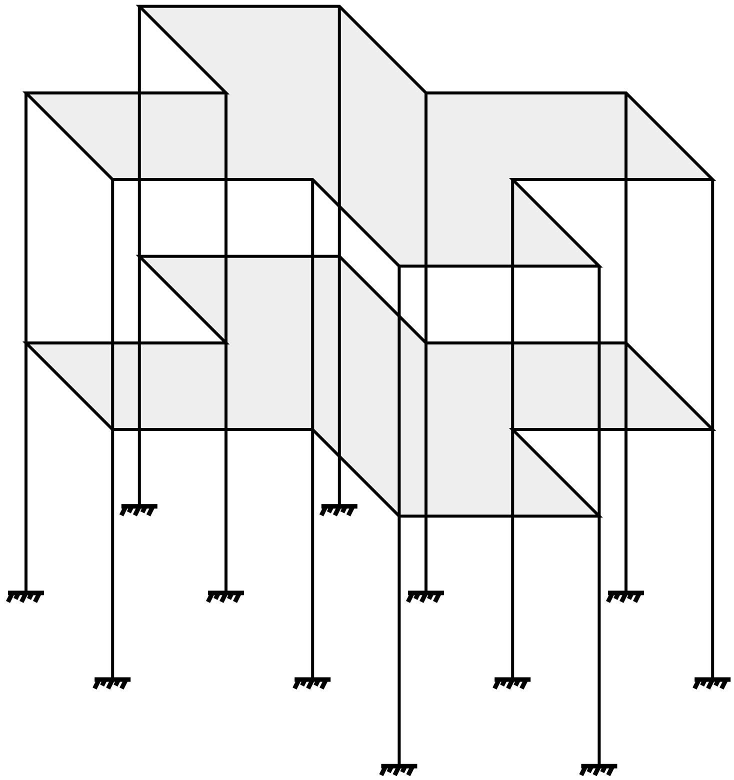

Figure 421: Isometric View

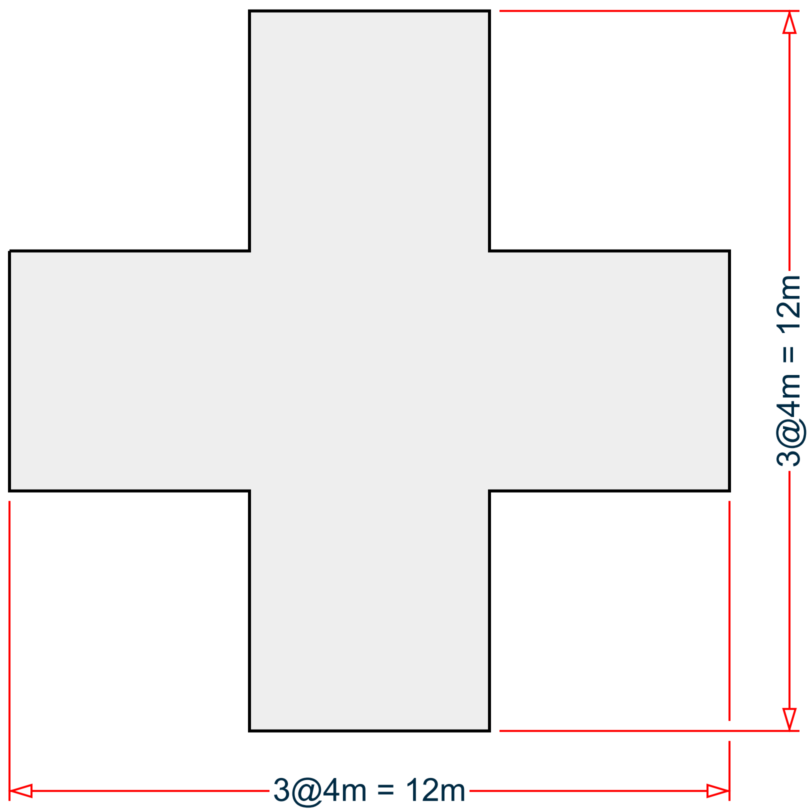

Figure 422: Plan View

Seismic parameters:

Zip code = 92887
Importance factor, I = 1.0
Response reduction factor in X, Rx = 3
Response reduction factor in Z, Rz = 4
Site class A
Long period, TL = 8 sec

Verification

Both diaphragms have the same dimensions and are doubly-symmetric. The overall building width in either direction is 12 m and the potential reentrant corner sides are 4 m. Therefore, the ratio of the $A/L = 4\ m\ /\ 12\ m = 0.333 > 0.15$.

Thus, each of the four corners are reentrant corners per the ASCE 7-16 code.

V. ASCE 7 Mass Irregularity

Verify mass irregularity check in accordance to the ASCE 7-16 specifications.

Details

A three story structure is modelled with floor diaphragms defined at the story levels.

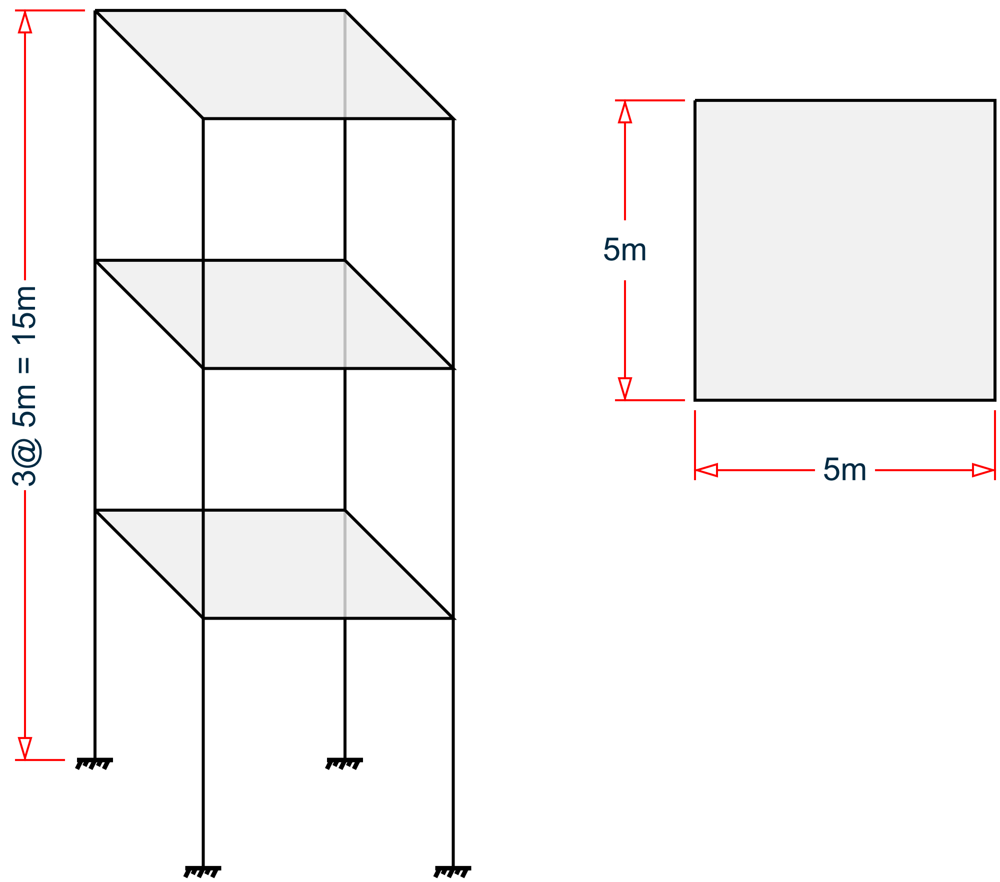

Figure 423: Isometric and Plan View of Structure

Seismic parameters:

Zip code = 92887
Importance factor, I = 1.0
Response reduction factor in X, Rx = 3
Response reduction factor in Z, Rz = 4
Site class A
Long period, TL = 8 sec

Verification

Diaphragm 1 = 1st Floor: Weight = 10 x 4 = 40 kN

Diaphragm 2 = 2nd Floor: Weight = 16 x 4 = 64 kN

Diaphragm 3 = 3rd Floor: Weight = 23 x 4 = 92 kN

Diaphragm	Current Floor Weight (KN)	Above Floor Weight (KN)	Below Floor Weight (KN)	Current Floor Weight/Above Floor Weight	Current Floor Weight/Below Floor Weight	Status (FAIL if ratio > 1.5)
1	40	64	N.A.	0.625	N.A.	OK
2	64	92	40	0.696	1.6	FAIL
3	92	N.A.	64	N.A.	1.4375	OK

Results

Table 460: Comparison of results

V.ASCE 7 Torsion Irregularity

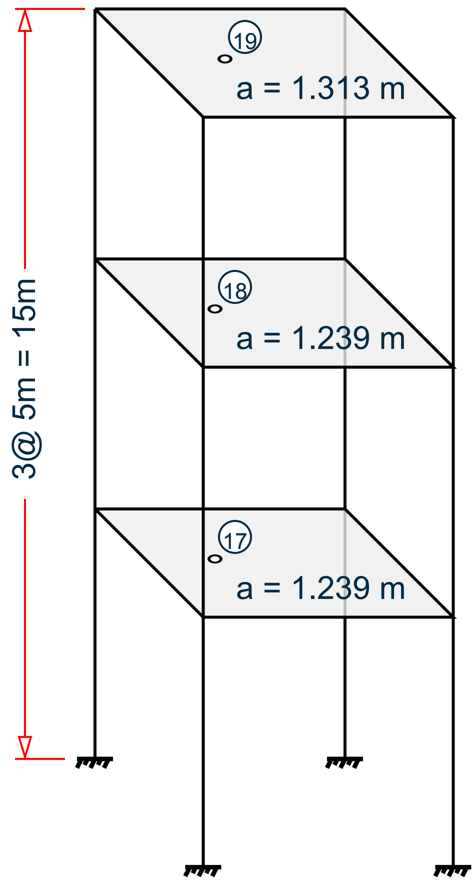
Verify the torsional irregularity check per the ASCE 7-16 specifications.

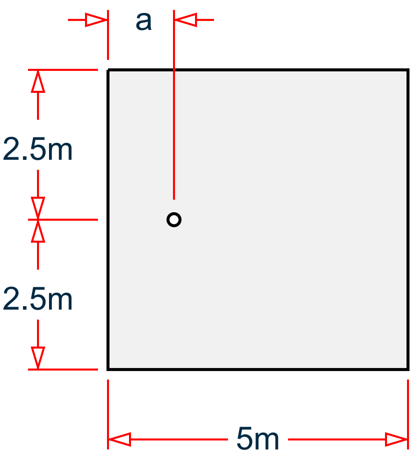
Details

A three story building is modelled with floor diaphragms defined at each floor level.

A 1 kip (4.4482 kN) load is applied to each diaphragm in both the global X and Z directions. In STAAD.Pro, this is modelled using an analytical node in each diaphragm. This is used to obtain the displacements in the nodes of the diaphragm.

Nodes 17, 18, and 19 are the control nodes in each diaphragm.





Validation

The displacements induced because of the applied loads on the control nodes for the nodes situated on the extremities of each diaphragm is taken from the STAAD.Pro output for each lateral direction.

Table 461: X direction checks

Diaphragm	Control Node	Primary LC Number	Diaphragm Extremities		Displacements (mm)		∆max/ ∆min	Status
			Extreme Node 1	Extreme Node 2	∆x Extreme Node 1	∆x Extreme Node 2		
1	17	1	2 or 3	6 or 7	0.0482 × 10 = 0.482	0.0482 × 10 = 0.482	0.482/0.482 = 1	OK
2	18	2	9 or 10	11 or 12	0.2443 × 10 = 2.443	0.2443 × 10 = 2.443	2.443/2.443 = 1	OK
3	19	3	13 or 14	15 or 16	0.6090 × 10 = 6.090	0.6090 × 10 = 6.090	6.090/6.090 = 1	OK

Table 462: Z direction checks

V.IBC 2018 Static Seismic T 1.2

Verify the program-calculated base shear and its distribution along the height of a three-story frame by using the equivalent lateral force method per IBC 2018. Also, verify the torsional moments to which the floors are subjected to, considering inherent as well as accidental torsion.

Details

A three-story structure is subject to a seismic load from the +X direction.

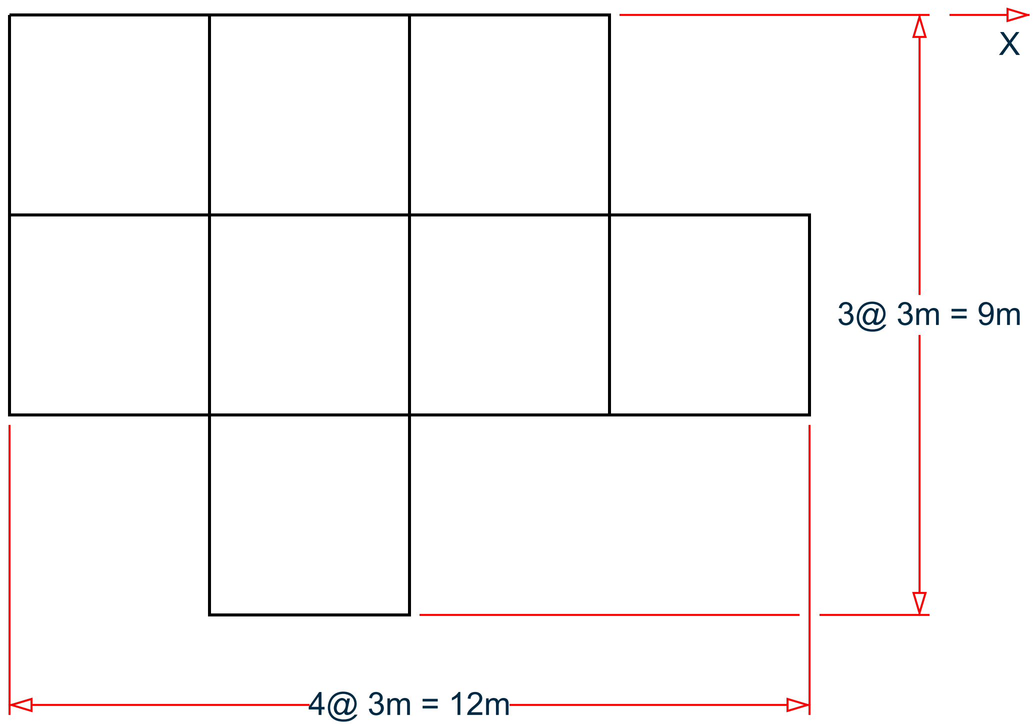

Figure 424: Plan View

Assumptions

i. Mapped MCER spectral response acceleration parameter at short period, $S_s = 2.02$
ii. Mapped MCER spectral response acceleration parameter at a period of 1 s, $S_1 = 0.795$
iii. Risk Category – I (Hence, From Table 1.5-2, Importance Factor I = 1)
iv. Site Class – D (SCLASS 4)
v. Response Modification Factor (RX & RZ) = 3
vi. Long-period Transition Time (TL)=12 s
vii. Seismic weight is composed of UDLs (magnitude -5 kN/m, direction GY) (defined in Reference Load Definition), incident on the beams
viii. Time Period of the Structure in both directions (PX & PZ) = 1.2 s
ix. Time period coefficients, CTX = CTZ = 0.28
x. Exponents in time period equation: XX = XZ = 1
xi. The effect of shear deformation is neglected

Validation

Calculation of Base Shear

Based on S_s and S_1, $F_a = 1$ (per table 11.4-1) and $F_v = 1.7$ (per table 11.4-2).

Hence:

$$S_{MS} = F_a \text{ x } S_s = 1 \text{ x } 2.02 = 2.02 \qquad \text{Eq. 11.4-1}$$

$$S_{DS} = 2/3 \times S_{MS} = 1.347 \qquad \text{Eq. 11.4-3}$$

$S_{M1} = F_v \times S_1 = 1.7 \times 0.795 = 1.382$ Eq. 11.4-3

$S_{D1} = 2/3 \times S_{M1} = 0.901$ Eq. 11.4-4

$$(C_s)_{\text{initial}} = \frac{S_{DS}}{R / I} = 0.4489$$ Eq. 12.8-2

The natural period of the structure, $T_N = 1.2\ s$ (`TX 1.2`, provides as user input).

Height of the structure, $h = 9\ m$.

So the approximate time period, $T_a = C_t \times h^x = 0.28(9m)^{1.0} = 2.52\ s$

From Table 12.8-1, $C_u = 1.4$ (for $S_{D1} > 0.4$).

$C_u \times T_a = 3.528\ s$

The time period used, T_R , is the lesser of T_N and $C_u \times T_a$, which is $1.2\ s$ ($< T_L = 12\ s$).

$$(C_s)_{\max} = \frac{S_{D1}}{T \times (R / I)} = 0.25028$$ Eq. 12.8-3

$(C_S)_{\min1} = 0.044 \times S_{DS} \times I = 0.059$ Eq. 12.8-5

Since $S_1 = 0.795 > 0.6g$, equation 12.8-6 also needs to be considered for calculating the lower limit of C_s :

$$(C_s)_{\min2} = \frac{0.5 \times S_1}{R / I} = 0.1325$$ Eq. 12.8-6

Therefore, $(C_s)_{min} = 0.1325 < C_s$.

$C_s = 1.5 \times 0.2503 = 0.3754$

The seismic weight, W is taken as the total seismic weight of the beams: $= 5 \times 3 \times 69 = 1{,}035\ kN$

So the total base shear, $V = C_S \times W = 0.3754 \times 1{,}035 = 388.56\ kN$

<u>Vertical Distribution of Lateral Forces</u>

Since, time period of the structure $T = 1.2\ s > 0.5\ s$ and $T < 2.5\ s$, as per clause 12.8.3, value of k needs to be linearly interpolated.

k = 1.35

Hence, from equation 12.8-11 and equation 12.8-12, we can find the lateral forces in different story levels, as follows:

Table 464: Vertical force distribution

Story Level	W_x **(kN)**	h_x **(m)**	$W_x \times h_x^{\ k}$	$\frac{W_x \times h_x^k}{\sum_{i=1}^{3}\left(W_i \times h_i^k\right)}$	**Lateral force at story level (kN)**
Roof	5 × 3 × 23 = 345	9	6,700	0.554	1.5×143.48 = 215.22
2nd	345	6	3,875	0.320	1.5×82.999 = 124.50
1st	345	3	1,520	0.126	1.5×32.560 = 48.840
Σ	1,035	-	12,095	1	388.56

<u>Consideration of Inherent Torsion (Clause 12.8.4.1)</u>

Floor Level – Roof (9 m)

From output file, CRZ = 3. 831 m and CMZ = 3.848 m

Hence, static eccentricity esi = CMZ - CRZ = 0.017 m

Floor Level – 2nd (6 m)

From output file , CRZ = 3.858 m and CMZ = 3.848 m

Hence, static eccentricity esi = CMZ - CRZ = -0.01 m

Floor Level – 1st (3 m)

From output file , CRZ = 3.902 m and CMZ = 3.848 m

Hence, static eccentricity esi = CMZ - CRZ = -0.054 m

<u>Consideration of Accidental Torsion (Clause 12.8.4.2)</u>

At all floor levels:

$$0.05 \times L_z = 0.05 \times 9\text{m} = 0.45 \text{ m}$$

where

L_z = the dimension of the structure along the global Z axis

Hence, total eccentricity to inherent and accidental torsion at roof level $e_r = (0.45 + 0.017) = 0.467\ m$

Total eccentricity to inherent and accidental torsion at 2nd floor level $e_2 = (0.45 - 0.01) = 0.44\ m$

Total eccentricity to inherent and accidental torsion at 1st floor level $e_1 = (0.45 - 0.054) = 0.396\ m$

Total torsional moment at roof level = $F_{roof} \times e_r = 215.20 \times 0.467 = 100.51\ kN{\cdot}m$

Total Torsional moment at 2nd floor level = $F_{2nd} \times e_2 = 124.50 \times 0.440 = 54.779$ kN·m

Total torsional moment at 1st floor level = $F_{1st} \times e_1 = 48.84 \times 0.396 = 12.893$ kN·m

Results

Table 465: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Base shear, V (kN)	388.56	388.56	none

V.IBC 2018 Static Seismic T Greater Than 2.5

Verify the program-calculated base shear and its distribution along the height of a 22-story frame by using equivalent lateral force method as per IBC 2018. Also, verify the torsional moments to which the floors are subjected to, considering inherent as well as accidental torsion.

Details

A 22-story structure is subject to a seismic load from the +X direction (see following figure). Each story is 10' in height (total building height of 220'). The column bases are assumed fixed. The time period of the structure uses is its Rayleigh frequency.

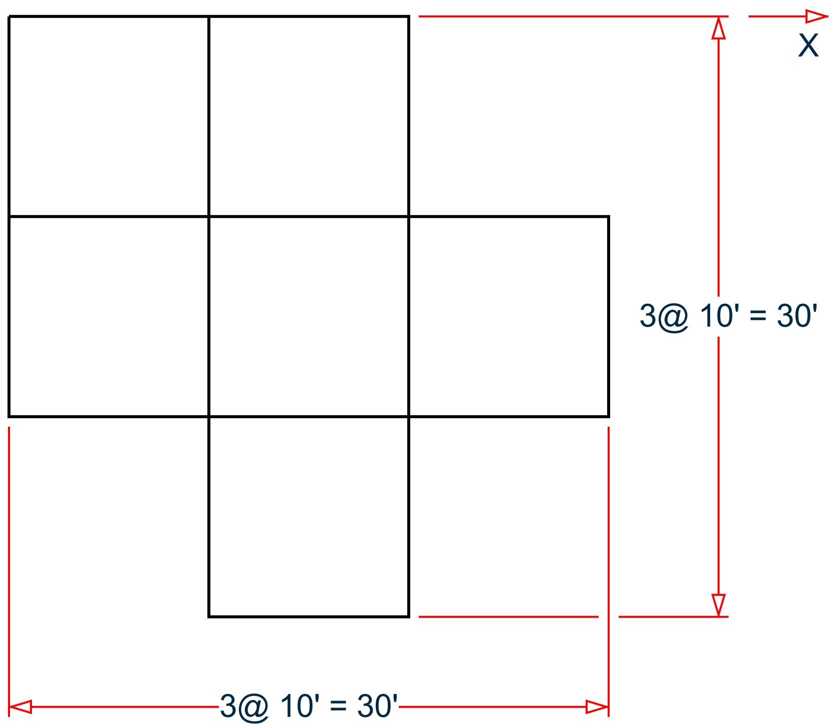

Figure 427: Plan View

<u>Assumptions</u>

i. Mapped MCER spectral response acceleration parameter at short period, $S_s = 1.5$
ii. Mapped MCER spectral response acceleration parameter at a period of 1 s, $S_1 = 0.5$
iii. Risk Category – I (Hence, From Table 1.5-2, Importance Factor I = 1)
iv. Site Class – D (SCLASS 4)
v. Response Modification Factor (RX & RZ) = 3
vi. Long-period Transition Time (TL)=12 s
vii. Seismic weight is composed of UDLs (magnitude -22.481 kip/ft, direction GY) (defined in Reference Load Definition), incident on the beams
viii. The effect of shear deformation is neglected

Validation

Calculation of Base Shear

Based on S_s and S_1, $F_a = 1$ (per table 11.4-1) and $F_v = 1.8$ (per table 11.4-2).

Hence:

$S_{MS} = F_a \text{ x } S_s = 1 \text{ x } 1.5 = 1.5$ Eq. 11.4-1

$S_{DS} = 2/3 \times S_{MS} = 1.0$ Eq. 11.4-3

$S_{M1} = F_v \text{ x } S_1 = 1.8 \times 0.5 = 0.9$ Eq. 11.4-3

$S_{D1} = 2/3 \times S_{M1} = 0.60$ Eq. 11.4-4

$$(C_s)_{\text{initial}} = \frac{S_{DS}}{R/I} = 0.333$$ Eq. 12.8-2

The time period of the structure is taken as the Rayleigh frequency of the structure (taken from the output file), $T_R = 18.12$ s.

Height of the structure, $h = 220$ ft.

For steel moment-resisting frames, $C_t = 0.028$ and $x = 0.8$ (per Table 12.8-2).

So the approximate time period, $T_a = C_t \times h^x = 0.028(220 \text{ ft})^{0.8} = 2.0946$ s

From Table 12.8-1, $C_u = 1.4$ (for $S_{D1} > 0.4$).

$C_u \times T_a = 2.9324$ s

The time period used, T, is the lesser of T_R and $C_u \times T_a$, which is 2.9324 s ($< T_L = 12$ s).

$$(C_s)_{\max} = \frac{S_{D1}}{T \times (R/I)} = 0.0682$$ Eq. 12.8-3

$(C_S)_{\min1} = 0.044 \times S_{DS} \times I = 0.044$ Eq. 12.8-5

Since $S_1 = 0.5 < 0.6g$, equation 12.8-6 does *not* need to be considered for calculating the lower limit of C_s :

Therefore, $C_s = 1.5 \times 0.0682 = 0.1023$ [*Clause 11.4.8, ii*].

The seismic weight, W is taken as the total seismic weight of the beams: $= 396 \times 22.481 \times 10 = 89{,}025$ *kip*

So the total base shear, $V = C_S \times W = 0.1023 \times 89{,}025 = 9{,}108$ *kip*

Vertical Distribution of Lateral Forces

Since, time period of the structure $T > 2.5$ s, as per clause 12.8.3, $k = 2$.

Hence, from equation 12.8-11 and equation 12.8-12, we can find the lateral forces in different story levels, as follows:

Table 466: Vertical force distribution

Story Level	W_x (kip)	h_x (ft)	$W_x \times h_x^{\ k}$	$\frac{W_x \times h_x^k}{\sum_{i=1}^{22}(W_i \times h_i^k)}$	Lateral force at story level (kip)

Consideration of Inherent and Accidental Torsion (as per Clause 12.8.4.1 and 12.8.4.2)

From the output, we can find the Center of Mass and Center of Rigidity values for different story of the structure, numerical difference between the two gives us the static eccentricity. For dynamic eccentricity calculation, the static eccentricity values are to be multiplied with a factor (DEC – 1) (DEC being the dynamic eccentricity factor, provided in the seismic load item in the model = 2), so (DEC-1) = 1. For accidental eccentricity, the multiplying factor ACC (ACC being the multiplication factor for Accidental Torsional Moment, provided in the seismic load item in the model = 0.05). These two eccentricities add up to give the total eccentricity due to inherent as well as accidental torsion. This eccentricity multiplied by the Lateral Force in a particular story level, gives the total torsional moment in that level. Calculations show the results to be:

Floor Level	Center of Mass, CM (ft)	Center of Rigidity CR (ft)	Static Eccentricity $SE = CM-CR$ (ft)	Dynamic Eccentricity $DE = SE \times DEC$ (ft)	Accidental Torsional Eccentricity AE (ft)	DE+AE (ft)	Lateral Force in the Story (kip)	Torsional Moment (kip-ft)

V.IBC 2018 Static Seismic T Less Than 0.5

Verify the program-calculated base shear and its distribution along the height of a three-story frame by using the equivalent lateral force method per IBC 2018. Also, verify the torsional moments to which the floors are subjected to, considering inherent as well as accidental torsion.

Details

A three-story structure is subject to a seismic load from the +X direction. The time period of the structure used is its calculated Rayleigh frequency (taken from STAAD.Pro output).

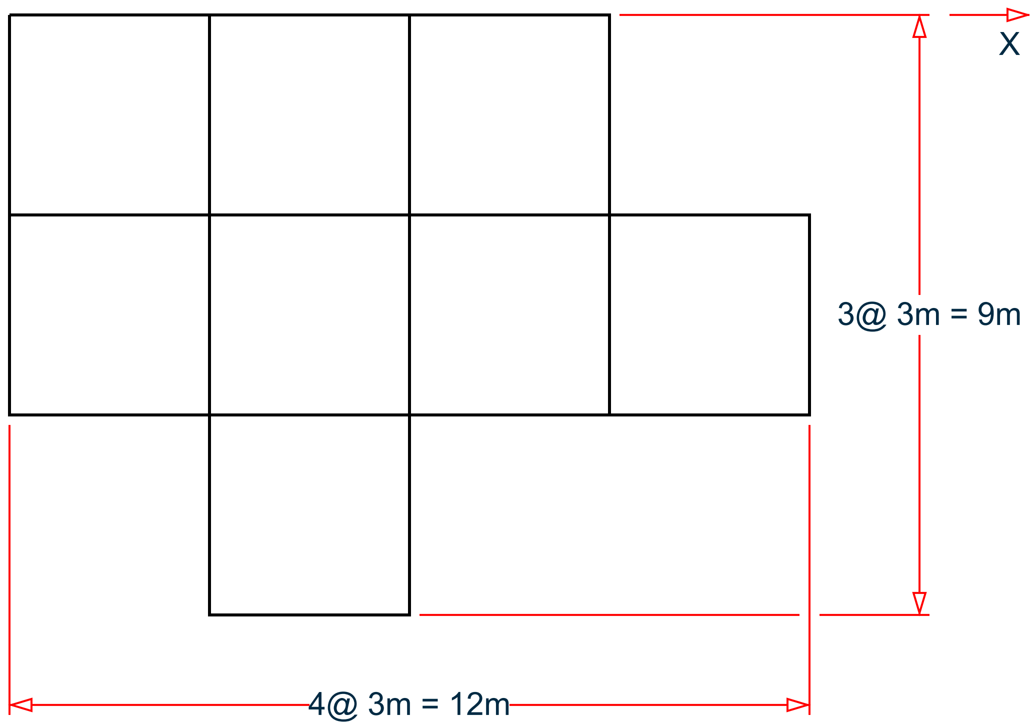

Figure 428: Plan View

Assumptions

i. Mapped MCER spectral response acceleration parameter at short period, $S_s = 2.02$
ii. Mapped MCER spectral response acceleration parameter at a period of 1 s, $S_1 = 0.795$
iii. Risk Category – I (Hence, From Table 1.5-2, Importance Factor I = 1)
iv. Site Class – D (SCLASS 4)
v. Response Modification Factor (RX & RZ) = 3
vi. Long-period Transition Time (TL)=12 s
vii. Seismic weight is composed of UDLs (magnitude -5 kN/m, direction GY) (defined in Reference Load Definition), incident on the beams
viii. The effect of shear deformation is neglected

Validation

Calculation of Base Shear

Based on S_s and S_1, $F_a = 1$ (per table 11.4-1) and $F_v = 1.7$ (per table 11.4-2).

Hence:

$$S_{MS} = F_a \times S_s = 1 \times 2.02 = 2.02 \qquad \text{Eq. 11.4-1}$$

$$S_{DS} = 2/3 \times S_{MS} = 1.347 \qquad \text{Eq. 11.4-3}$$

$$S_{M1} = F_v \times S_1 = 1.7 \times 0.795 = 1.382 \qquad \text{Eq. 11.4-3}$$

$$S_{D1} = 2/3 \times S_{M1} = 0.901 \qquad \text{Eq. 11.4-4}$$

$$(C_s)_{\text{initial}} = \frac{S_{DS}}{R / I} = 0.4489$$ Eq. 12.8-2

The time period of the structure is taken as the Rayleigh frequency of the structure (taken from the output file), $T_R = 0.201\ s$.

Height of the structure, $h = 9\ m$.

For concrete moment-resisting frames, $C_t = 0.0466$ and $x = 0.9$ (per Table 12.8-2).

So the approximate time period, $T_a = C_t \times h^x = 0.0466(9\ m)^{0.9} = 0.3367\ s$

From Table 12.8-1, $C_u = 1.4$ (for $S_{D1} > 0.4$).

$$C_u \times T_a = 0.4713\ \text{s}$$

The time period used, T, is the lesser of T_R and $C_u \times T_a$, which is $0.201\ s$ ($< T_L = 12\ s$).

$$(C_s)_{\max} = \frac{S_{D1}}{T \times (R / I)} = 1.4942$$ Eq. 12.8-3

$$(C_S)_{\min1} = 0.044 \times S_{DS} \times I = 0.0592$$ Eq. 12.8-5

Since $S_1 = 0.795 > 0.6g$, equation 12.8-6 also needs to be considered for calculating the lower limit of C_s :

$$(C_s)_{\min2} = \frac{0.5 \times S_1}{R / I} = 0.1325$$ Eq. 12.8-6

Therefore, $(C_s)_{min} = 0.1325 < C_s$.

$$C_s = 0.4489$$

The seismic weight, W is taken as the total seismic weight of the beams: $= 5 \times 3 \times 69 = 1{,}035\ kN$

So the total base shear, $V = C_S \times W = 0.4489 \times 1{,}035 = 464.6\ kN$

Vertical Distribution of Lateral Forces

Since, time period of the structure $T = 0.201\ s < 0.5\ s$, as per clause 12.8.3, $k = 1$.

Hence, from equation 12.8-11 and equation 12.8-12, we can find the lateral forces in different story levels, as follows:

Table 468: Vertical force distribution

Story Level	W_x **(kN)**	h_x **(m)**	$W_x \times h_x^{\ k}$	$\frac{W_x \times h_x^k}{\sum_{i=1}^{3}\left(W_i \times h_i^k\right)}$	**Lateral force at story level (kN)**
Roof	5 × 3 × 23 = 345	9	3,105	0.500	232.3
2nd	345	6	2,070	0.333	154.9
1st	345	3	1,035	0.167	77.40
Σ	1,035	-	6,210	1	464.6

Consideration of Inherent Torsion (Clause 12.8.4.1)

Floor Level – Roof (9 m)

From output file, CRZ = 3. 831 m and CMZ = 3.848 m

Hence, static eccentricity esi = CMZ - CRZ = 0.017 m

Floor Level – 2nd (6 m)

From output file , CRZ = 3.858 m and CMZ = 3.848 m

Hence, static eccentricity esi = CMZ - CRZ = -0.01 m

Floor Level – 1st (3 m)

From output file , CRZ = 3.902 m and CMZ = 3.848 m

Hence, static eccentricity esi = CMZ - CRZ = -0.054 m

Consideration of Accidental Torsion (Clause 12.8.4.2)

At all floor levels:

$$0.05 \times L_z = 0.05 \times 9\text{m} = 0.45 \text{ m}$$

where

L_z = the dimension of the structure along the global Z axis

Hence, total eccentricity to inherent and accidental torsion at roof level $e_r = (0.45 + 0.017) = 0.467\ m$

Total eccentricity to inherent and accidental torsion at 2nd floor level $e_2 = (0.45 - 0.01) = 0.44\ m$

Total eccentricity to inherent and accidental torsion at 1st floor level $e_1 = (0.45 - 0.054) = 0.396\ m$

Total torsional moment at roof level = $F_{roof} \times e_r = 232.3 \times 0.467 = 108.48\ kN \cdot m$

Total Torsional moment at 2nd floor level = $F_{2nd} \times e_2$ = 154.867 x 0.44 = 68.141 kN·m

Total torsional moment at 1st floor level = $F_{1st} \times e_1$ = 77.433 x 0.396 = 30.664 kN·m

Results

Table 469: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Base shear, V (kN)	464.6	464.6	none	
Lateral force at roof level (kN)	232.3	232.3	negligible	
Lateral force at 2nd floor (kN)	154.9	154.867	negligible	
Lateral force at 1st floor (kN)	77.4	77.433	negligible	
Torsional moment at roof level (kN·m)	108.48	108.523	negligible	
Torsional moment at 2nd floor (kN·m)	68.141	68.092	negligible	

Result Type	Reference	STAAD.Pro	Difference	Comments
Torsional moment at 1st floor (kN·m)	30.664	30.619	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\06 Loading\IBC\IBC 2018 Static Seismic T Less Than 0.STD` is typically installed with the program.

V. IBC 2018 Response Spectrum

Calculation of Base Shear for Response Spectrum Method in IBC 2018.

Details

A three story building is modelled in STAAD.Pro considering the following:

Location: Corona, CA (`ZIP 92887`)
Short period acceleration, $S_s = 1.996$
One second acceleration: $S_1 = 0.7$
Site class A
Response modification factor, $R = 3$
Importance factor, $I = 1.0$
$F_a = 0.8$
$F_v = 0.8$
$TL = 8$

The generated model is subjected to a Response Spectrum Load along global X direction. The base shear reported by STAAD.Pro is verified against hand calculation.

Validation

Natural Frequency/Time Period Information & Mode Shapes (Obtained from output file)

Table 470: Natural Frequencies/Time Period

Mode	Frequency (cyc/sec)	Time Period (sec)
1	3.332	0.30014
2	9.103	0.10986
3	12.435	0.08042

Table 471: Mode Shapes

Mode Participation Factor $\prod \sum Wi \times \phi / \sum Wi \times \phi^2$		1.244			0.333			0.0893		

Horizontal Acceleration Spectrum Value Calculation.

$$S_{ms} = S_s \times F_a = 1.996 \times 0.8 = 1.597$$

$$S_{m1} = S_1 \times F_v = 0.7 \times 0.8 = 0.56$$

$$S_{ds} = 2/3 \times S_{ms} = 2/3 \times 1.597 = 1.065$$

$S_{d1} = 2/3 \times S_{m1} = 2/3 \times 0.56 \times 0.373$

$T_0 = 0.2 \times (S_{d1}/S_{ds}) = 0.2 \times (0.373 / 1.065) = 0.070$

$T_s = S_{d1}/S_{ds} = 0.373 / 1.065 = 0.350$

	Mode 1	Mode 2	Mode 3
Time Period T	0.30014 ($T_0 \leq T \leq T_s$)	0.10986 ($T_0 \leq T \leq T_s$)	0.08042 ($T_0 \leq T \leq T_s$)
Formula	$S_a = S_{ds}$	$S_a = S_{ds}$	$S_a = S_{ds}$
S_a	1.065	1.065	1.065
$C_s = S_a/(R_x/I)$	0.355	0.355	0.355

Table 473: Base Shear Calculation and its Distribution Across Height

V. IBC 2015 Response Spectrum

Calculation of Base Shear for Response Spectrum Method in IBC 2015.

Details

A three story buiding is modelled in STAAD.Pro considering the following:

Location: Corona, CA (`ZIP 92887`)
Short period acceleration, $S_s = 2.24658$
One second acceleration: $S_1 = 0.817039$
Site class E
Response modification factor, $R = 3$
Importance factor, $I = 1.0$
$F_a = 0.9$
$F_v = 2.4$
$TL = 8$

The generated model is subjected to a Response Spectrum Load along global X direction. The base shear reported by STAAD.Pro is verified against hand calculation.

Validation

Horizontal Acceleration Spectrum Value Calculation.

$S_{ms} = S_s \times F_a = 2.24658 \times 0.9 = 2.022$

$S_{m1} = S_1 \times F_v = 0.817039 \times 2.4 = 1.961$

$S_{ds} = 2/3 \times S_{ms} = 2/3 \times 2.022 = 1.348$

$S_{d1} = 2/3 \times S_{m1} = 2/3 \times 1.961 = 1.307$

$T_0 = 0.2 \times (S_{d1}/S_{ds}) = 0.2 \times (1.307 / 1.348) = 0.1940$

$T_s = S_{d1}/S_{ds} = 1.307 / 1.348 = 0.9698$

	Mode 1	Mode 2	Mode 3
Time Period T	0.30014 ($T_0 \leq T \leq T_s$)	0.10986 ($T < T_0$)	0.08042 ($T < T_0$)
Formula	$S_a = S_{ds}$	$S_a = S_{ds} \times (0.4 + 0.6 \times (T/T_0))$	$S_a = S_{ds} \times (0.4 + 0.6 \times (T/T_0))$
S_a	1.348	0.997	0.875
$C_s = S_a/(R_x/I)$	0.449	0.332	0.292

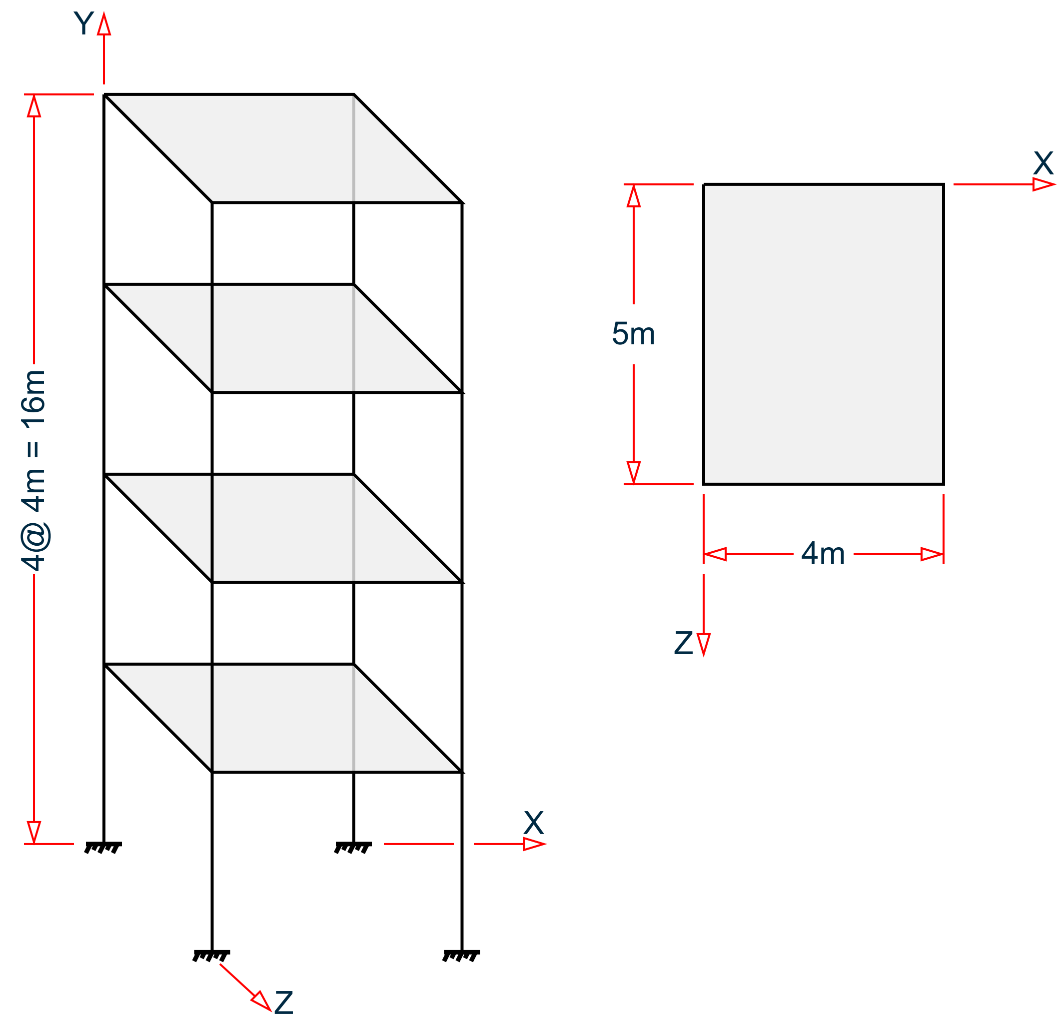
V. IBC 2015 Static Seismic

Calculation of base shear and its distribution along the height for equivalent lateral force method in IBC 2015.

Problem

Structure to be modelled:

height = 4× 4m = 16m
plan dimension X = 4m
plan dimension Z = 5m



Input parameters:

Location: Corona, CA, USA (`ZIP 92877`)
Site class D (`SCLASS 4`)
Long-period transition time = 12s (`TL 12`)
Importance factor = 1.0 (`I 1.0`)
Response modification factor X = 3 (`RX 3`)
Response modification factor Z = 4 (`RZ 4`)

The seismic weight for each floor is assumed as 200 KN applied as joint weight of 50KN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per IBC 2015 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Calculations

ZIP = 92887; Ss = 2.247 & S1 = 0.817

For Site Class D, Fa = 1 (Ss > 1.25) and Fv = 1.5 (S1 > 0.5)

SMS = Ss × Fa = 2.247, SM1 = S1 × Fv = 1.2255

SDS = 2/3 × SMS = 1.498, SD1 = 2/3 × SM1 = 0.817

For concrete moment resisting frames Ct = 0.0466 in metric system & x = 0.9

Height = ha = 16m, Ta = Ct × ha^x = 0.0466 × $16^{0.9}$ = 0.565,

Since SD1 = 0.817 > 0.4, Cu = 1.4

Cu × Ta = 1.4 × 0.565 = 0.791

T (from output file) = 1.286, Cu × Ta = 0.791 < 1.286, T_{used} = 0.791

Cs_x = SDS/(Rx/I) = 1.498 / (3/1) = 0.49933

Cs_x lower limit = 0.044 × SDS × I & 0.5 × S1 / (Rx/I),

Cs_x lower limit = 0.044 × 1.498 × 1 & 0.5 × 0.817 / (3/1)

Cs_x lower limit = 0.065912 & 0.136166

Cs_x upper limit = SD1 / (T_{used} × (Rx/I)) as T_{used} < TL

Cs_x upper limit = 0.817 / (0.791 × (3/1)) = 0.34429

Cs_x used = 0.34429

Seismic Base Shear V = Cs × W = 0.34429 × (200 × 4) = 275.432 KN

Lateral seismic force Fx = C_{vx} × V where C_{vx} = W_x × hx^k / ∑ W_i × hi^k

Since T_{used} = 0.791 sec > 0.5 Sec distribution of Base Shear along story levels would have the value of exponent k linearly interpolated between 1 (less than equal to 0.5 sec) and 2 (greater than equal to 2.5 sec) i.e. power = 1.1455.

Story Level	W_i	h_i	$Wi \times hi^{1.1455}$	$(Wi \times hi^{1.1455})/\sum(Wi \times hi^{1.1455})$	F_x
Roof	200	16	4,790.2	0.4209	115.941
3rd	200	12	3,445.3	0.3028	83.391
2nd	200	8	2,165.3	0.1903	52.409
1st	200	4	978.79	0.0860	23.691
Summation	800		11,379.6	1	
V_x	275.432				

Comparison

V. IBC 2012 Response Spectrum

Calculation of Base Shear for Response Spectrum Method in IBC 2012.

Details

A three story buiding is modelled in STAAD.Pro considering the following:

Location: Corona, CA (`ZIP 92887`)
Short period acceleration, $S_s = 2.24658$
One second acceleration: $S_1 = 0.817039$
Site class E
Response modification factor, $R = 3$
Importance factor, $I = 1.0$
$F_a = 0.9$
$F_v = 2.4$
$TL = 8$

The generated model is subjected to a Response Spectrum Load along global X direction. The base shear reported by STAAD.Pro is verified against hand calculation.

Validation

Horizontal Acceleration Spectrum Value Calculation.

$S_{ms} = S_s \times F_a = 2.24658 \times 0.9 = 2.022$

$S_{m1} = S_1 \times F_v = 0.817039 \times 2.4 = 1.961$

$S_{ds} = 2/3 \times S_{ms} = 2/3 \times 2.022 = 1.348$

$S_{d1} = 2/3 \times S_{m1} = 2/3 \times 1.961 = 1.307$

$T_0 = 0.2 \times (S_{d1}/S_{ds}) = 0.2 \times (1.307 / 1.348) = 0.1940$

$T_s = S_{d1}/S_{ds} = 1.307 / 1.348 = 0.9698$

	Mode 1	**Mode 2**	**Mode 3**
Time Period T	0.30014 ($T_0 \leq T \leq T_s$)	0.10986 ($T < T_0$)	0.08042 ($T < T_0$)
Formula	$S_a = S_{ds}$	$S_a = S_{ds} \times (0.4 + 0.6 \times (T/T_0))$	$S_a = S_{ds} \times (0.4 + 0.6 \times (T/T_0))$
S_a	1.348	0.997	0.875
$C_s = S_a/(R_x/I)$	0.449	0.332	0.292

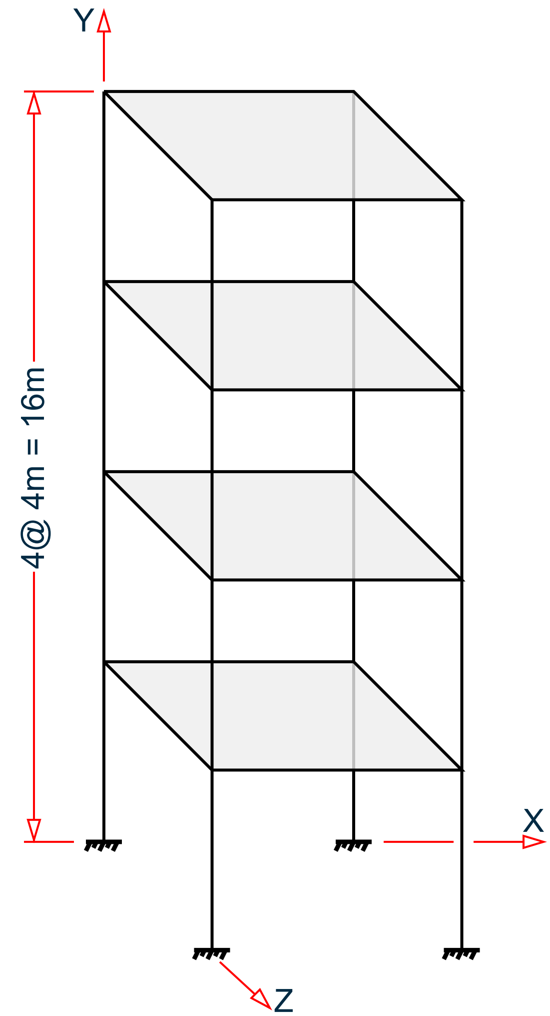
V. IBC 2012 Static Seismic

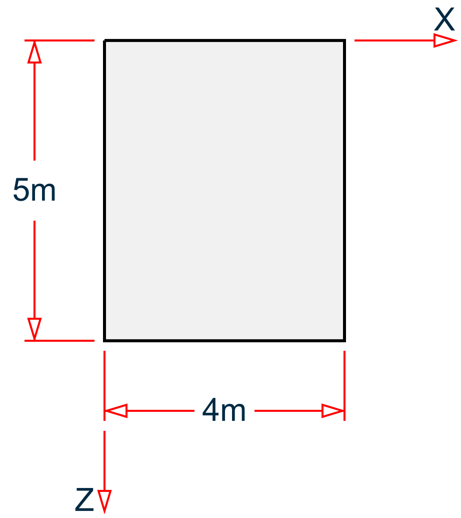
Calculation of base shear and its distribution along the height for equivalent lateral force method in IBC 2012.

Problem

Structure to be modelled:

height = 4× 4m = 16m
plan dimension X = 4m
plan dimension Z = 5m





Input parameters:

Location: Corona, CA, USA (`ZIP 92877`)
Site class D (`SCLASS 4`)
Long-period transition time = 12s (`TL 12`)
Importance factor = 1.0 (`I 1.0`)
Response modification factor X = 3 (`RX 3`)
Response modification factor Z = 4 (`RZ 4`)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per IBC 2012 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Calculations

ZIP = 92887; $S_s = 2.247$ & $S_1 = 0.817$

For Site Class D, $F_a = 1$ ($S_s > 1.25$) and $F_v = 1.5$ ($S_1 > 0.5$)

SMS = $S_s \times F_a$ = 2.247, SM1 = $S_1 \times F_v$ = 1.2255

SDS = 2/3 × SMS = 1.498, SD1 = 2/3 × SM1 = 0.817

For concrete moment resisting frames Ct = 0.0466 in metric system & x = 0.9

Height = ha = 16m, $Ta = Ct \times ha^x = 0.0466 \times 16^{0.9} = 0.565$,

Since SD1 = 0.817 > 0.4, Cu = 1.4

Cu × Ta = 1.4 × 0.565 = 0.791

T (from output file) = 1.286, Cu × Ta = 0.791 < 1.286, T_{used} = 0.791

Cs_x = SDS/(Rx/I) = 1.498 / (3/1) = 0.49933

Cs_x lower limit = 0.044 × SDS × I & 0.5 × S1 / (Rx/I),

Cs_x lower limit = 0.044 × 1.498 × 1 & 0.5 × 0.817 / (3/1)

Cs_x lower limit = 0.065912 & 0.136166

Cs_x upper limit = SD1 / (T_{used} × (Rx/I)) as T_{used} < TL

Cs_x upper limit = 0.817 / (0.791 × (3/1)) = 0.34429

Cs_x used = 0.34429

Seismic Base Shear V = Cs × W = 0.34429 × (200 × 4) = 275.432 kN

Lateral seismic force Fx = C_{vx} × V where $C_{vx} = W_x \times hx^k / \sum W_i \times hi^k$

Since T_{used} = 0.791 sec > 0.5 Sec distribution of Base Shear along story levels would have the value of exponent k linearly interpolated between 1 (less than equal to 0.5 sec) and 2 (greater than equal to 2.5 sec) i.e. power = 1.1455.

Story Level	W_i	h_i	$Wi \times hi^{1.1455}$	$(Wi \times hi^{1.1455})/\sum(Wi \times hi^{1.1455})$	F_x
Roof	200	16	4,790.2	0.4209	115.941
3rd	200	12	3,445.3	0.3028	83.391

V. IBC 2006 Response Spectrum

Calculation of Base Shear for Response Spectrum Method in IBC 2006.

Details

A three story buiding is modelled in STAAD.Pro considering the following:

Location: Corona, CA (`ZIP 92887`)
Short period acceleration, $S_s = 1.8157$
One second acceleration: $S_1 = 0.67269$
Site class D
Response modification factor, $R = 3$
Importance factor, $I = 1.0$
$F_a = 1.0$
$F_v = 1.5$
$TL = 12$

The generated model is subjected to a Response Spectrum Load along global X direction. The base shear reported by STAAD.Pro is verified against hand calculation.

Validation

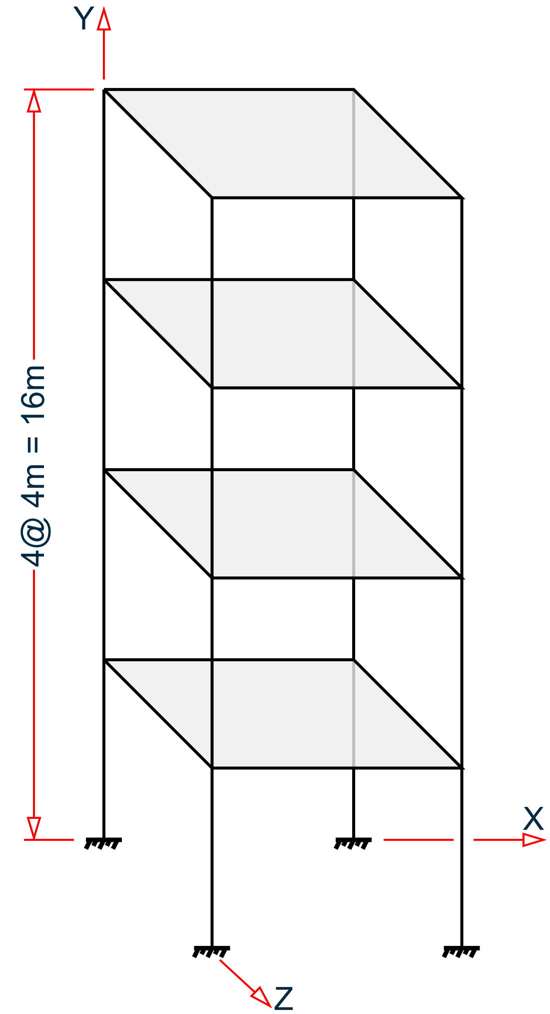
V. IBC 2006 Static Seismic

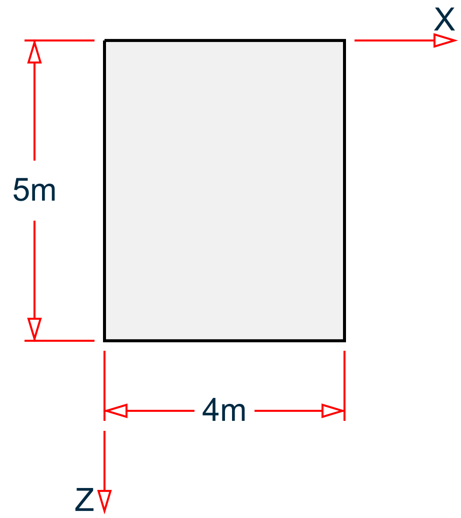
Calculation of base shear and its distribution along the height for equivalent lateral force method in IBC 2006.

Problem

Structure to be modelled:

height = 4× 4m = 16m
plan dimension X = 4m
plan dimension Z = 5m





Input parameters:

Location: Corona, CA, USA (`ZIP 92877`)
Site class D (`SCLASS 4`)
Long-period transition time = 12s (`TL 12`)
Importance factor = 1.0 (`I 1.0`)
Response modification factor X = 3 (`RX 3`)
Response modification factor Z = 4 (`RZ 4`)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per IBC 2006 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Calculations

ZIP = 92887; Ss = 2.247 & S1 = 0.817

For Site Class D, Fa = 1 (Ss > 1.25) and Fv = 1.5 (S1 > 0.5)

SMS = Ss × Fa = 2.247, SM1 = S1 × Fv = 1.2255

SDS = 2/3 × SMS = 1.498, SD1 = 2/3 × SM1 = 0.817

For concrete moment resisting frames Ct = 0.0466 in metric system & x = 0.9

Height = $hn = 16m = 52.49\ ft$, $Ta = C_T \times hn^x = 0.016 \times 52.49^{0.9} = 0.565$,

Since $S_{D1} = 0.673 > 0.4$, $Cu = 1.4$

$$\mathrm{Cu} \times \mathrm{Ta} = 1.4 \times 0.565 = 0.791$$

T (from output file) = 1.286, Cu × Ta = 0.791 < 1.286, $T_{used} = 0.791$

$$Cs_x = S_{DS}/(R_x/I) = 1.21067 / (3/1) = 0.404$$

$$Cs_x \text{lower limit} = \max \left| \begin{array}{l} 0.01 \\ \dfrac{0.5 \times S_1}{R_x / I} = \dfrac{0.5 \times 0.673}{3/1} = 0.112 \end{array} \right.$$

$$Cs_x \text{ upper limit} = S_{D1} / (T_{used} \times (Rx/I)) = 0.673 / (0.791 \times (3/1)) = 0.2835$$

$$Cs_x \text{ used} = 0.2835$$

Seismic Base Shear $V = Cs \times W = 0.2835 \times (200 \times 4) = 226.8\ kN$

Lateral seismic force $Fx = C_{vx} \times V$

where

$$C_{vx} = W_x \times h_x^k \ / \sum W_i \times h_i^k$$

Since $T_{used} = 0.791\ sec > 0.5\ Sec$ distribution of base shear along story levels would have the value of exponent k linearly interpolated between 1 (less than equal to 0.5 sec) and 2 (greater than equal to 2.5 sec) i.e. $k = 1.1455$.

Story Level	W_i	h_i	$W_i \times h_i^{1.1455}$	$(W_i \times h_i^{1.1455})/\sum(W_i \times h_i^{1.1455})$	F_x
Roof	200	16	4,792.1	0.4210	95.51
3rd	200	12	3,446.6	0.3028	68.69
2nd	200	8	2,166.0	0.1903	43.17
1st	200	4	979.0	0.0860	19.52

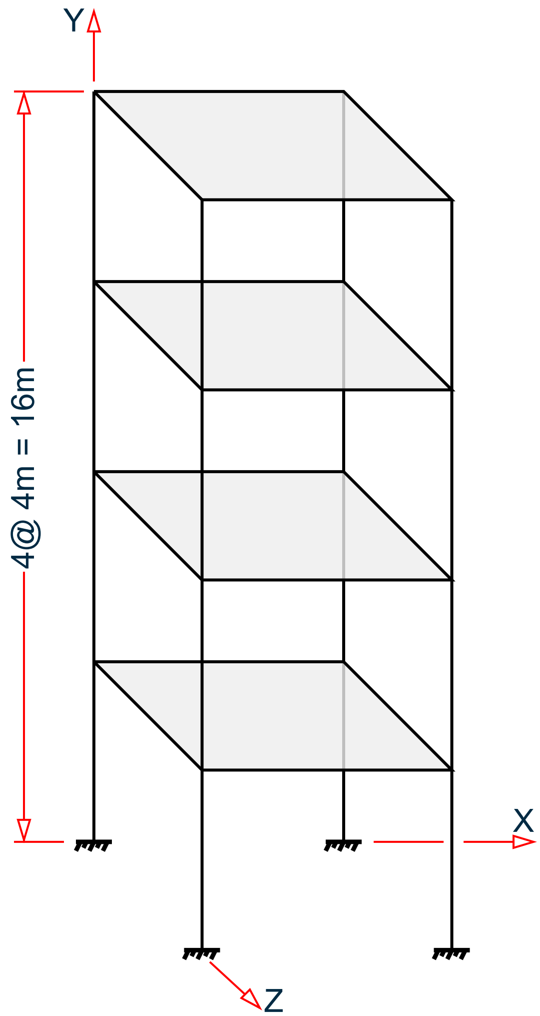
V. IBC 2003 Static Seismic

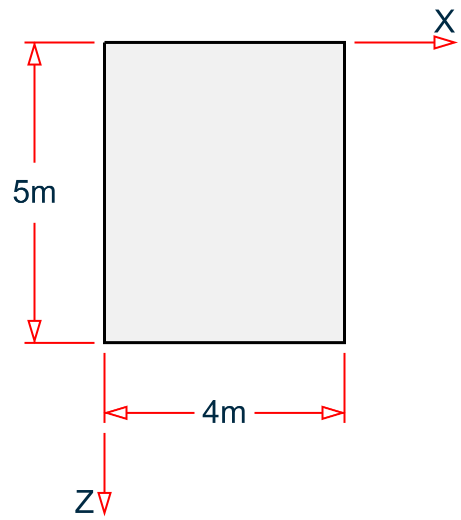
Calculation of base shear and its distribution along the height for equivalent lateral force method in IBC 2003.

Problem

Structure to be modelled:

height = 4× 4m = 16m
plan dimension X = 4m
plan dimension Z = 5m





Input parameters:

Short period acceleration, S_{DS} = 1.21067 (`SDS 1.21067`)
1-Second period acceleration, S_{D1} = 0.673 (`SD1 0.673`)
Site class D (`SCLASS 4`)
Importance factor = 1.0 (`I 1.0`)
Response modification factor X = 3 (`RX 3`)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per IBC 2003 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Calculations

For concrete moment-resisting frames, $C_T = 0.016$ and $x = 0.9$.

Height = $hn = 16m = 52.49\ ft$, $Ta = C_T \times hn^x = 0.016 \times 52.49^{0.9} = 0.565$,

Since $S_{D1} = 0.673 > 0.4$, $Cu = 1.4$

$$Cu \times Ta = 1.4 \times 0.565 = 0.791$$

T (from output file) = 1.286, Cu × Ta = 0.791 < 1.286, $T_{used} = 0.791$

$$Cs_x = S_{DS}/(R_x/I) = 1.21067 / (3/1) = 0.404$$

$$Cs_x \text{lower limit} = \max \begin{cases} 0.044 \times S_{DS} \times I = 0.044 \times 1.21067 \times 1 = 0.0533 \\ \dfrac{0.5 \times S_1}{R_x / I} = \dfrac{0.5 \times 0.673}{3/1} = 0.112 \end{cases}$$

$$Cs_x \text{ upper limit} = S_{D1} / (T_{used} \times (Rx/I)) = 0.673 / (0.791 \times (3/1)) = 0.2835$$

$$Cs_x \text{ used} = 0.2835$$

Seismic Base Shear $V = Cs \times W = 0.2835 \times (200 \times 4) = 226.8\ kN$

Lateral seismic force $Fx = C_{vx} \times V$
where

$$C_{vx} = W_x \times h_x^k / \sum W_i \times h_i^k$$

Since $T_{used} = 0.791\ sec > 0.5\ Sec$ distribution of base shear along story levels would have the value of exponent k linearly interpolated between 1 (less than equal to 0.5 sec) and 2 (greater than equal to 2.5 sec) i.e. $k = 1.1457$.

Story Level	W_i	h_i	$W_i \times h_i^{1.1457}$	$(W_i \times h_i^{1.1457})/\sum(W_i \times h_i^{1.1457})$	F_x

V. IBC 2000 Static Seismic

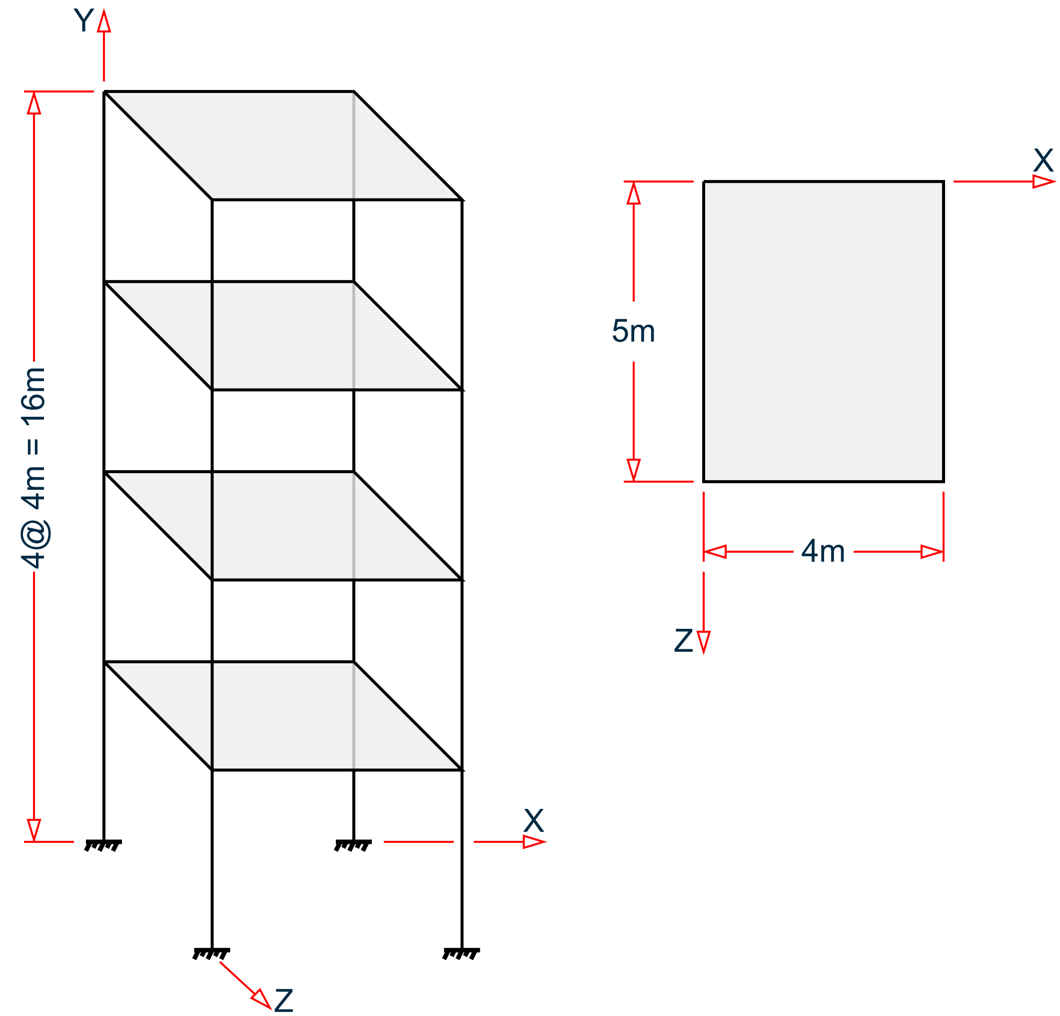
Calculation of base shear and its distribution along the height for equivalent lateral force method in IBC 2000.

Problem

Structure to be modelled:

height = 4× 4m = 16m
plan dimension X = 4m

plan dimension Z = 5m



Input parameters:

Short period acceleration, S_{DS} = 0.06 (`SDS 0.06`)
1-Second period acceleration, S_{D1} = 1.36 (`SD1 1.36`)
Site class D (`SCLASS 4`)
Building period coefficient = 0.073 (`CT 0.073`)
Importance factor = 1.0 (`I 1.0`)
Response modification factor X = 3 (`RX 3`)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per IBC 2000 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Calculations

Height = $hn = 16m$, $Ta = C_T \times hn^x = 0.073 \times 16^{0.75} = 0.584$,

Since $S_{D1} = 1.36 > 0.4$, $Cu = 1.2$

$$Cu \times Ta = 1.2 \times 0.584 = 0.701$$

T (from output file) = 1.286, Cu × Ta = 0.701 < 1.286, $T_{used} = 0.701$

$$Cs_x = S_{DS}/(R_x/I) = 0.06 / (3/1) = 0.02$$

$$Cs_x \text{lower limit} = \max \begin{vmatrix} 0.044 \times S_{DS} \times I = 0.044 \times 0.06 \times 1 = 0.00264 \\ \frac{0.5 \times S_1}{R_x / I} = \frac{0.5 \times 1.3}{3/1} = 0.2167 \end{vmatrix}$$

$$Cs_x \text{ upper limit} = S_{D1} / (T_{used} \times (Rx/I)) = 1.36 / (0.701 \times (3/1)) = 0.6469$$

$$Cs_x \text{ used} = 0.2167$$

Seismic Base Shear $V = Cs \times W = 0.2167 \times (200 \times 4) = 173.3\ kN$

Lateral seismic force $Fx = C_{vx} \times V$

where

$$C_{vx} = W_x \times h_x^k / \sum W_i \times h_i^k$$

Since $T_{used} = 0.701\ sec > 0.5\ Sec$ distribution of base shear along story levels would have the value of exponent k linearly interpolated between 1 (less than equal to 0.5 sec) and 2 (greater than equal to 2.5 sec) i.e. $k = 1.1004$.

Story Level	W_i	h_i	$W_i \times h_i^{1.1004}$	$(W_i \times h_i^{1.1004})/\sum(W_i \times h_i^{1.1004})$	F_x

V. IS 1893

V. IS 1893 2016 Response Spectrum

Calculation of base shear and its distribution along the height for response spectrum method in IS 1893 (Part 1) : 2016

Problem

A three story building is modelled in STAAD.Pro considering the following:

Seismic zone factor, Z = 0.36
Importance factor, I = 1.2
Response reduction factor, R = 5
Soil site conditions = Hard

The generated model is subjected to a response spectrum load along global X direction. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Natural Frequency/Time Period Information & Mode Shapes (Obtained from output file)

Table 495: Natural Frequencies/Time Period

Mode	Frequency (cyc/sec)	Time Period (sec)

V. IS 1893 2016 Static Seismic

Calculation of base shear and its distribution along the height for equivalent static method in IS 1893 (Part 1) : 2016

Problem

A reinforced concrete frame structure is 4 bays at 4m ea. by 3 bays at 4m ea. in plan. The structure is 3 stories at 3m ea.

The structure is modelled in STAAD.Pro considering the following:

Seismic zone factor, $Z = 0.36$ (`ZONE 0.36`)
Importance factor, $I = 1.2$ (`I 1.2`)
Response reduction factor, $R = 5$ (`RF 5`)
Soil site condition = Hard (`SS 1`)
Structure type is a reinforced concrete frame (`ST 1`)

The seismic weight for each floor is assumed as 100 kN applied as joint weight to nodes 39, 60 & 80. Seismic Loads as per IS 1893 (Part 1) : 2016 specifications are generated along two horizontal directions global X & global Z and also along vertical direction global Y. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Height = 3 × 3 = 9m

$$Ta_x = 0.075h^{0.75} = 0.075 \times (9^{0.75}) = 0.39 \text{ sec}$$

$$Ta_z = 0.075h^{0.75} = 0.075 \times (9^{0.75}) = 0.39 \text{ sec}$$

$$[Sa/g]_x = [Sa/g]_z = 2.5 \text{ (As time period < 0.4 sec)}$$

$$[Sa/g]_y = 2.5 \text{ (constant)}$$

$$Ah_x = (Z/2) \times (I/R) \times [Sa/g]_x = 0.36/2 \times 1.2/5 \times 2.5 = 0.108$$

$$Ah_z = (Z/2) \times (I/R) \times [Sa/g]_z = 0.36/2 \times 1.2/5 \times 2.5 = 0.108$$

$$Av = (2/3) \times (Z/2) \times (I/R) \times [Sa/g]_y = 2/3 \times 0.36/2 \times 1.2/5 \times 2.5 = 0.072$$

$$VB = Ah \times W \text{ or } Av \times W$$

$$VB_x = Ah_x \times W = 0.108 \times (3 \times 100) = 32.4 \text{ kN}$$

$VBmin_x$ = 2.4% of W = 2.4 × (3 × 100) / 100 = 7.2 kN

$VB_x > VBmin_x$

$VB_z = Ah_z \times W = 0.108 \times (3 \times 100) = 32.4$ kN

$VBmin_z$ = 2.4% of W = 2.4 × (3 × 100) / 100 = 7.2 kN

$VB_z > VBmin_z$

$VB_y = Av \times W = 0.072 \times (3 \times 100) = 21.6$ kN

Story Level	Wi	hi	Wi × hi ^{2}	(Wi × hi ^{2})/∑ (Wi × hi ^{2})	Qx	Qz	Qy
Roof	100	9	8,100	0.6429	20.83	20.83	13.886

V. IS 1893 2016 GL Calculation

Calculation of the base shear and its distribution along the height using the static method for Global X, Global Z, Global Y directions using IS 1893:2016 (Part 1).

Details

The following structure is modelled.

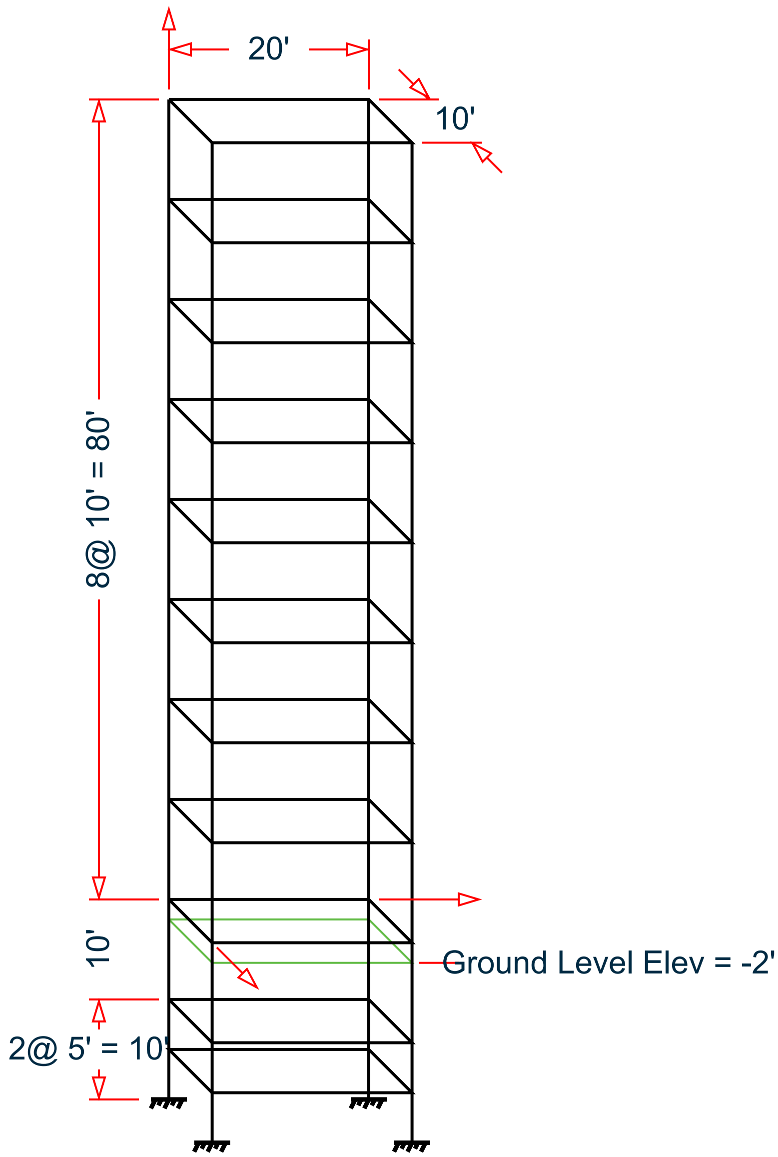

Figure 429:

The STAAD.Pro load definition parameters are also specified:

Parameter	Value	STAAD.Pro Value
Seismic zone factor, Z	0.16	`Z 0.16`
Importance factor, I	1	`I 1`
Response reduce factor, R	3 (OMRF)	`RF 3`
Soil site condition	Hard soil	`SS 1`

Parameter	Value	STAAD.Pro Value
Structure type	Steel moment-resisting frame building	`ST 3`

Total height of the building is 100 ft

Dimension of each floor slab is 20 ft × 10 ft

Floor to floor height for super structure is 10 ft

Floor to floor height for sub structure is 5 ft

GL is located at -2 ft (Y co-ordinate)

Depth of Foundation (DT) is (20-2) = 18 ft = 5.4864 m

All the analytical members are W shaped steel beam (W12X190)

Supports are fixed

The generated model is subjected to joint weight(100kip). The base shear and its distribution along the height is calculated in Global X, Global Z, Global Y direction.

Verification

Design horizontal acceleration coefficient value calculation for above GL and below GL for Global X(Ah), Global Z(Ah), Global Y(Av) direction.

Table 500: Calculated values for hard soil

Value	X	Z	Y
Time Period (s)	1.103	1.103	
Sa/g	0.907 $(1/T,\ 0.4s < t < 4s)$	0.907 $(1/T,\ 0.4s < t < 4s)$	2.5
A_h or A_v	0.02418	0.02418	0.04445
A_h or A_v 30 m	0.01209	0.01209	0.0222
Reduced A_h or A_v	0.02197	0.02197	0.04038

Base shear calculation and its distribution along the height for above GL and below GL for Global X, Global Z, Global Y direction and V_{bmin} calculation

Table 501: Vertical distribution of forces above GL

Story Level in ft from base.	Wi (kip)	hi (m from GL)	Wi× hi^2	(Wi × hi^2)/∑ (Wi × hi$_2$)	Qx (kip)	Qz (kip)	Qy (kip)

V. IS 1893 2016 Irregular Modes of Oscillation

Verify irregular modes of oscillation check in accordance to IS 1893 2016 Part 1 specifications.

Details

A three story structure is modelled with floor diaphragms defined at the story levels.

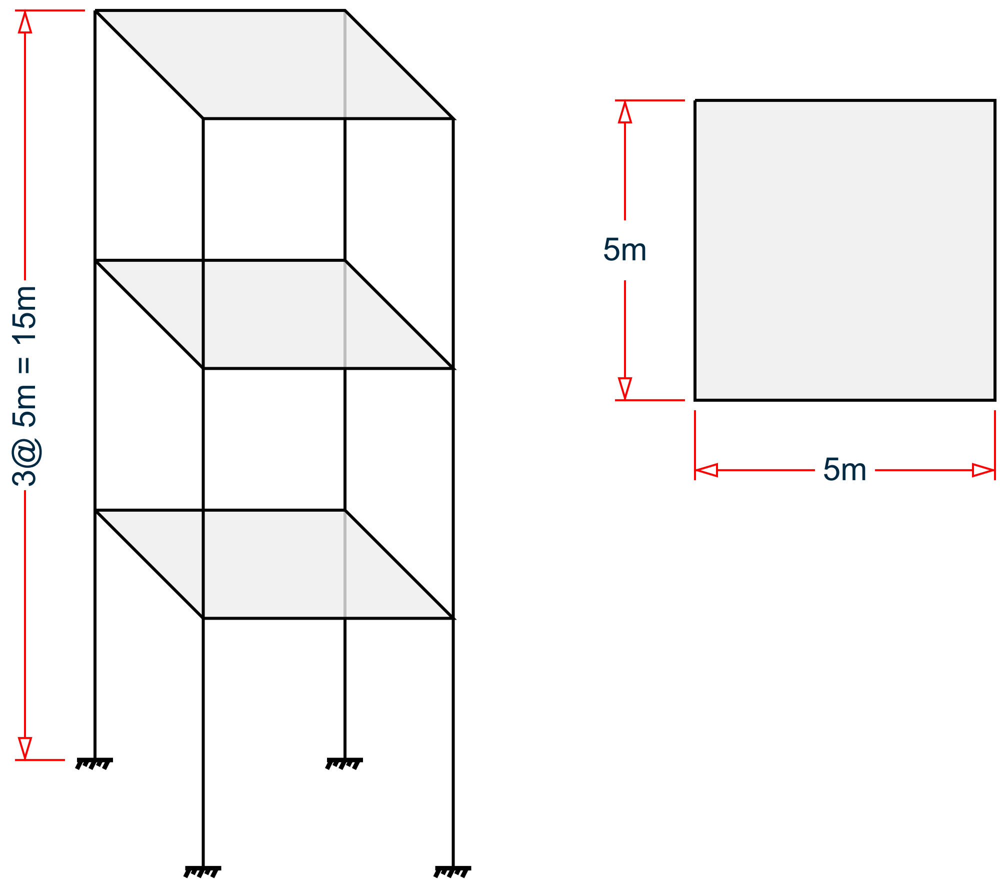

Figure 430: Isometric and Plan View of Structure

Seismic parameters:

Seismic Zone Factor, Z = 0.36
Importance Factor, I = 1.2
Response Reduction Factor, R = 5
Site soil conditions: hard soil (SS 1)
Structure type: other: (ST 5)

Verification

Since the structure is in Zone V the check has two parts. These include:

1. First three lateral translational modes together contribute at least 65% mass participation factor in each principal plan direction.
2. The fundamental lateral natural periods of the building in the two principal plan directions are away from each other by at least 10% of the larger value.

Looking at the mass participation factor table in output file following observations are made:

Mode Number	Mass Participation X	Mass Participation Z	Time Period (s)
1	0	32.66	0.24728
2	25.58	0	0.22941
3	0.09	0	0.17942
4	0	46.31	0.138
5	59.03	0	0.13033
6	0.31	0	0.09761
7	0	21.02	0.05435
8	14.69	0	0.04952
9	0.31	0	0.0419
10	0	0.01	0.02119

First three lateral translational modes for X direction are:

Mode Number	Mass Participation (%)
2	25.58
5	59.03
8	14.69
Sum	99.3
Status (PASS if sum > 65%)	PASS

First three lateral translational modes for Z direction are:

Mode Number	Mass Participation (%)
1	32.66
4	46.31
7	21.02
Sum	99.99
Status (PASS if sum > 65%)	PASS

The sum of first three lateral translational modes for both X and Z directions are more than 65% and hence, the check for irregular modes of oscillation passes for both X and Z directions.

Also, it is observed that the maximum mass participation for X direction occurs in mode 5 and for Z direction occurs in mode 4. Hence for the second part of the check the period of these modes needs to be checked for being away from each other by at least 10% of the larger value.

Mode Number MPx (max)	Mode Number MPz (max)	Time Period, x (max)	Time Period, z (max)	% Separation (of the larger value)	Status (FAIL if % Separation < 10)
5	4	0.1303	0.138	5.557	FAIL

Results

Table 504: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Mass Participation Summation of first three lateral translational modes, X direction (%)	99.3	99.292	negligible	
Mass Participation Summation of first three lateral translational modes, Z direction (%)	99.99	99.981	negligible	
Check status – X direction	PASS	PASS	none	
Check status – Z direction	PASS	PASS	none	
Percent separation	5.557	5.5567	negligible	
Check status	FAIL	FAIL	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\06 Loading\IS 1893\IS 1893 2016 Irregular Modes of Oscillation.STD` is typically installed with the program.

V. IS 1893 2016 Mass Irregularity

Verify mass irregularity check in accordance to IS 1893 2016 Part 1 specifications.

Details

A three story structure is modelled with floor diaphragms defined at the story levels.

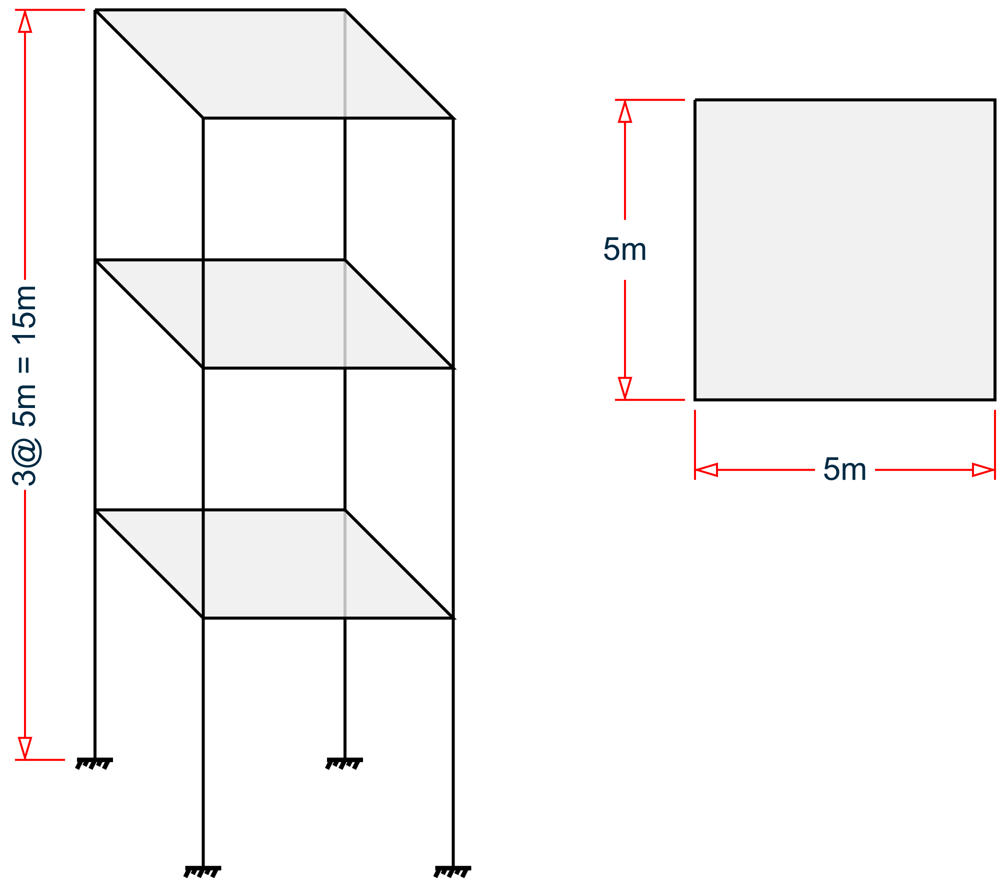

Figure 431: Isometric and Plan View of Structure

Seismic parameters:

Seismic Zone Factor, Z = 0.36
Importance Factor, I = 1.2
Response Reduction Factor, R = 5
Site soil conditions: hard soil (SS 1)

Structure type: other: (ST 5)

Verification

Diaphragm 1 = 1st Floor: Weight = 10 x 4 = 40 kN

Diaphragm 2 = 2nd Floor: Weight = 16 x 4 = 64 kN

Diaphragm 3 = 3rd Floor: Weight = 23 x 4 = 92 kN

Diaphragm	Current Floor Weight (KN)	Above Floor Weight (KN)	Below Floor Weight (KN)	Current Floor Weight/Above Floor Weight	Current Floor Weight/Below Floor Weight	Status (FAIL if ratio > 1.5)
1	40	64	N.A.	0.625	N.A.	OK
2	64	92	40	0.696	1.6	FAIL
3	92	N.A.	64	N.A.	1.4375	OK

Results

Table 505: Comparison of results

Result Type		Reference	STAAD.Pro	Difference	Comments
Diaphragm 1	Ratio of 1st/2nd floor weights	0.625	0.625	none	
	Check	OK	OK	none	
Diaphragm 2	Ratio of 2nd/3rd floor weights	0.696	0.696	none	
	Check	OK	OK	none	
	Ratio of 2nd/1st floor weights	1.6	1.6	none	
	Check	Fail	Fail	none	
Diaphragm 3	Ratio of 3rd/2nd floor weights	1.438	1.437	negligible	
	Check	OK	OK	none

- *TR.28.2.2 Check Irregularities* (on page 2333)

V. IS 1893 2016 Re entrant Corners

Verify reentrant corner (plan irregularity) check in accordance to IS 1893 2016 Part 1 specifications.

Details

A two story structure is modelled with diaphragms at the story levels.

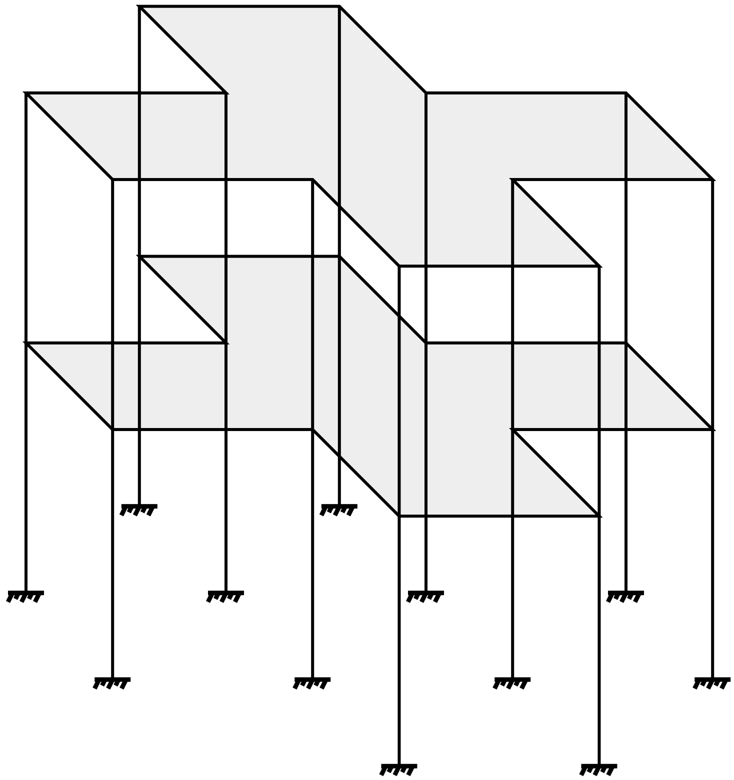

Figure 432: Isometric View

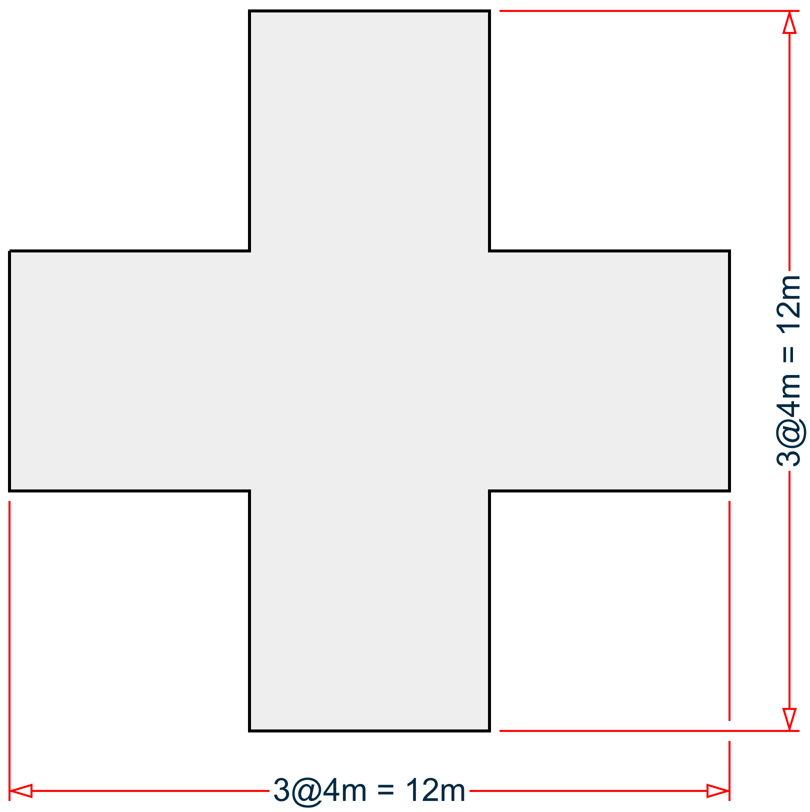

Figure 433: Plan View

Seismic parameters:

Seismic Zone Factor, Z = 0.36
Importance Factor, I = 1.2
Response Reduction Factor, R = 5
Site soil conditions: hard soil (SS 1)
Structure type: other: (ST 5)

Verification

Both diaphragms have the same dimensions and are doubly-symmetric. The overall building width in either direction is 12 m and the potential reentrant corner sides are 4 m. Therefore, the ratio of the $A/L = 4\ m\ /\ 12\ m = 0.333 > 0.15$.

Thus, each of the four corners are reentrant corners per the IS 1893 2016 code.

Results

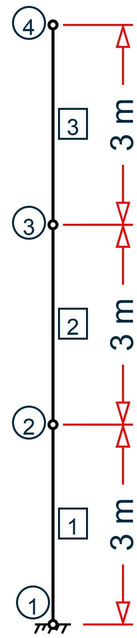
V. IS 1893 2016 Response Spectrum Vertical

Calculation of base shear for vertical motion of oscillation by response spectrum method in IS 1893 : 2016 (Part 1).

Details

The structure is modelled in STAAD.Pro considering the following:

Seismic zone factor, Z = 0.36
Importance factor, I = 1.2
Response reduction factor, R = 5
Soil site conditions = Hard



The dimension of the columns is 0.2m x 0.1 m and material is concrete

The generated model is subjected to a response spectrum load along global Y direction.

Natural frequencies / time period and mode shapes are obtained from the STAAD.Pro output file.

Table 507: Natural frequency / time period

Mode	Frequency (cyc/sec)	Time Period (sec)
1	9.913	0.10088
2	27.083	0.03692
3	36.996	0.02703

V. IS 1893 2016 Torsion Irregularity

Verify part 1 of the torsional irregularity check per the IS 1893 2016 Part 1 specifications.

Details

A three story building is modelled with floor diaphragms defined at each floor level.

A 1 kip (4.4482 kN) load is applied to each diaphragm in both the global X and Z directions. In STAAD.Pro, this is modelled using an analytical node in each diaphragm. This is used to obtain the displacements in the nodes of the diaphragm.

Nodes 17, 18, and 19 are the control nodes in each diaphragm.

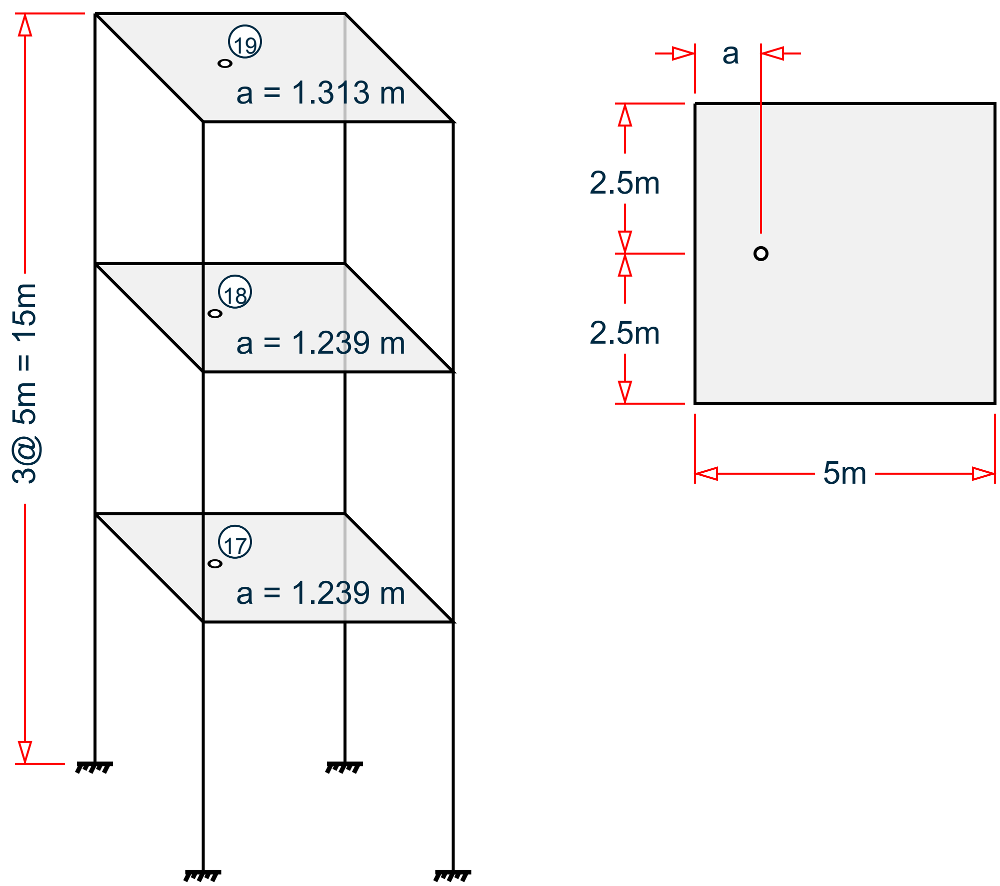

Figure 434: Structure diagram

Validation

As per Cl. 7.8.2, the design eccentricity, e_{di}, is computed as the a constant times the dynamic eccentricity plus or minus the accidental eccentricity:

$$e_{di} = \begin{vmatrix} 1.5e_{si} + 0.05b_i & \text{(Case 1)} \\ 1.0e_{si} - 0.05b_i & \text{(Case 2)} \end{vmatrix}$$

where

e_{si}	=	the static eccentricity at floor i, which is the distance between the center of rigidity and the center of mass at that level
b_i	=	the floor plan dimension at floor i, perpendicular to the direction of force $= 5\ m$ for this example in both direction at all floors

Also, to perform a torsion irregularity check unit load should be applied at edi considering design eccentricity. Hence, in addition to unit load $F = 1\ kip\ (4.45\ kN)$, a moment $M = F \times (lever\ arm)$ is also applied at the center of mass.

The displacements induced because of the applied loads on the control nodes for the nodes situated on the extremities of each diaphragm is taken from the STAAD.Pro output for each lateral direction.

X direction

By inspection, the center of rigidity (as reported by STAAD.Pro) and the center of mass are located at the same point at each floor. Therefore, $e_{si} = 0$.

Table 512: X Direction: Case 1 (ACC = +0.05, DEC = 1.5)

Diaphragm	Control Node	e_{si} (m) (C.M. - C.R.)	Dynamic Eccentricity ($1.5e_{si}$)	Accidental Eccentricity ($0.05b_i$)	Design Eccentricity ($e_{di} = 1.5e_{si} + 0.05b_i$)	F_x Applied at C.M.	M_y Applied at CM ($F_x \times (e_{di} - e_{si})$)
1	17	0	0	0.25	0.25	4.45	1.11
2	18	0	0	0.25	0.25	4.45	1.11
3	19	0	0	0.25	0.25	4.45	1.11

Table 513: X Direction: Case 2 (ACC = -0.05, DEC = 1.0)

Diaphragm	Control Node	e_{si} (m) (C.M. - C.R.)	Dynamic Eccentricity ($1.0e_{si}$)	Accidental Eccentricity ($-0.05b_i$)	Design Eccentricity ($e_{di} = 1.0e_{si} - 0.05 b_i$)	F_x Applied at C.M.	M_y Applied at CM ($F_x \times (e_{di} - e_{si})$)
1	17	0	0	-0.25	-0.25	4.45	-1.11
2	18	0	0	-0.25	-0.25	4.45	-1.11
3	19	0	0	-0.25	-0.25	4.45	-1.11

The displacements induced because of the applied loads centers of mass for the nodes situated on the extremities of each diaphragm are taken from the STAAD.Pro output for each lateral direction.

V. IS 1893 2015 Response Spectrum

Calculate the base shear and its distribution along the height for the response spectrum method in the IS 1893 (Part4): 2015 specification.

Details

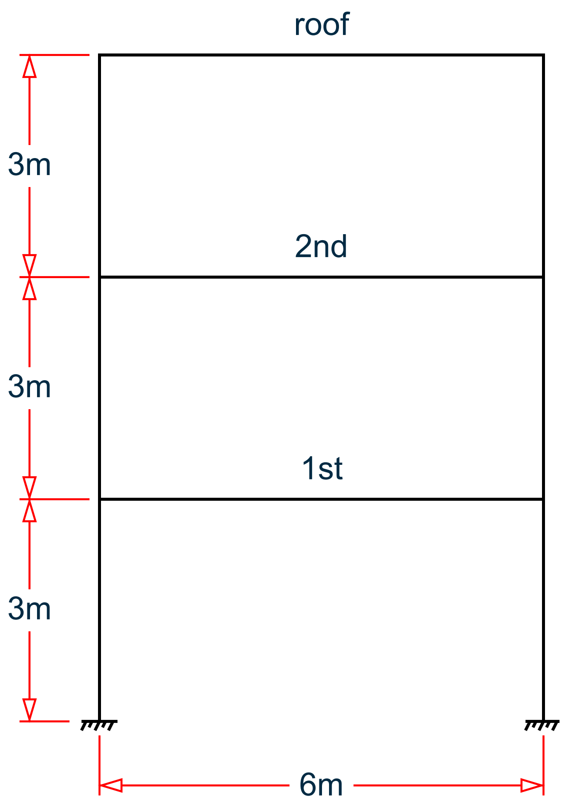

Figure 435: A three story frame

Beam and column dimensions: 500 mm × 500 mm

Material: concrete

The structure is modelled in STAAD.Pro considering the following:

- Seismic zone factor, $Z = 0.16$ (`ZONE 0.16`)
- Importance factor, $I = 1.5$ (`I 1.5`)
- Response reduction factor, $R = 5$ (`RF 5`)
- Soil site condition = Soft (`SOIL TYPE 3`)
- Minimum factor of total weight for base shear (`RSMIN 2.75`)

Validation

Table 521: Natural Frequency/Time Period Information & Mode Shapes (Obtained from output file)

Mode	Frequency (cyc/sec)	Time Period (sec)
1	0.229	4.3681
2	0.625	1.59884

Mode	Frequency (cyc/sec)	Time Period (sec)
3	0.854	1.17043

Table 522: Mode shapes

Mode	Story Level/Joint Numbers	X-Trans	Y-Trans	Z-Trans	X-Rot	Y-Rot	Z-Rot

Table 523: Mass participation factor and mod participation factor calculations

	Mode 1	Mode 2	Mode 3
Modal Weight, $Mk \times g$	$\frac{183.00^2}{147.11} = 227.7$	$\frac{49.035^2}{147.11} = 16.35$	$\frac{13.138^2}{147.11} = 1.173$
Modal Weight Participation (In %)	$\frac{227.7}{245.18} \times 100 = 92.85$	$\frac{16.35}{245.18} \times 100 = 6.666$	$\frac{1.173}{245.18} \times 100 = 0.479$
Mode Participation Factor, Pk	$\frac{183.00}{147.11} = 1.244$	$\frac{49.035}{147.11} = 0.333$	$\frac{13.138}{147.11} = 0.089$

Direction factor = $\frac{Z}{2} \times \frac{I}{R} = \frac{0.16}{2} \times \frac{1.5}{5} = 0.024$

	Mode 1	Mode 2	Mode 3
Sa/g	$\frac{1.67}{T} = \frac{1.67}{4.368} = 0.382$	$\frac{1.67}{T} = \frac{1.67}{1.599} = 1.045$	$\frac{1.67}{T} = \frac{1.67}{1.170} = 1.427$
$Ak = \frac{Z}{2} \times \frac{I}{R} \times \frac{Sa}{g}$	$0.024 \times 0.382 = 0.00918$	$0.024 \times 1.045 = 0.0251$	$0.024 \times 1.427 = 0.0342$

Story Level	Weight, W_i (kN)	Mode 1			Mode 2			Mode 3			Story Shear due to all modes (i.e., SRSS of all modes)
		ϕ	$Qi = (Ak \times \phi \times Pk \times Wi)$	$Vi = (\sum Qi)$	ϕ	$Qi = (Ak \times \phi \times Pk \times Wi)$	$Vi = (\sum Qi)$	ϕ	$Qi = (Ak \times \phi \times Pk \times Wi)$	$Vi = (\sum Qi)$	
Roof	49.035	1	0.560	0.560	-1	-0.410	-0.410	1	0.150	0.150	0.71
2nd Floor	98.07	0.866	0.970	1.530	0	0	-0.410	-0.866	-0.260	-0.110	1.59
1st Floor	98.07	0.5	0.560	2.089	1	0.820	0.410	0.5	0.150	0.040	2.13
Total SRSS Shear											2.13

Minimum base shear per Table 2:

$$2.75 \times 245.18 / 100 = 6.74 \text{ kN}$$

The multiplying factor (ratio of minimum base shear to total SRSS base shear): $6.47 / 2.13 = 3.17$

Results

Table 524:

Result Type	Reference	STAAD.Pro	Difference	Comments
Story shear, roof (kN)	0.71	0.71	none	
Story shear, 2nd (kN)	1.59	1.59	none	
Story shear, 1st (kN)	2.13	2.13	none	
Base shear (kN)	2.13	2.13	none	
Minimum base shear (kN)	6.74	6.7423	negligible	
Multiplying factor	3.17	3.1668	negligible

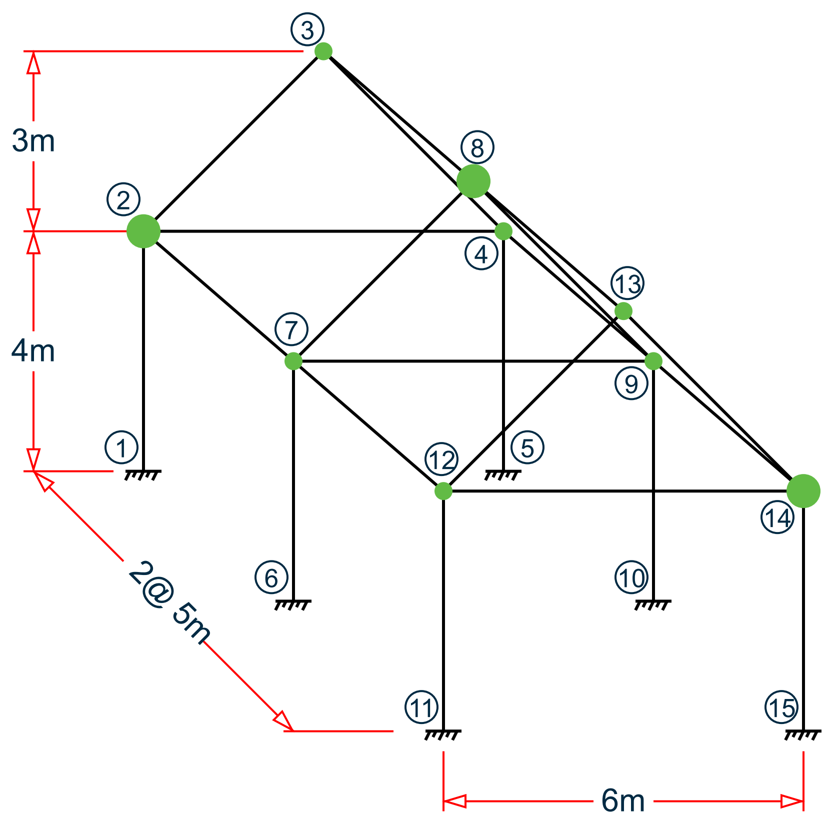
Related Links

- *TR.32.10.1.9 Response Spectrum Specification per IS: 1893 (Part 4)-2015* (on page 2555)

V. IS 1893 2015 Static Seismic

Calculate the design lateral force at each node in each global direction by the equivalent static seismic method per the IS 1893 (Part 4) 2015 specification.

Details



The loads at each node are taken as the same in each global direction (i.e., $W_{xi} = W_{zi} = W_{yi}$). Loads at nodes 2, 8, and 14 are 15 kN ea. Loads at nodes 3, 4, 7, 9, 12, and 13 are 10 kN ea.

Sections used for all members: ISMB 450

Materials used: steel

The structure is modelled in STAAD.Pro considering the following:

- Seismic zone factor, $Z = 0.36$ (`ZONE 0.36`)
- Importance factor, $I = 1.0$ (`I 1.0`)
- Response reduction factor, $R = 5$ (`RF 5`)
- Soil site condition = Hard (`SS 1`)
- Structure type is a category 4 (`ST 4`)
- 2% Damping (`DM 0.02`)

Validation

Seismic Load

Seismic Loads as per IS 1893 (Part 4): 2015 specifications are generated along two horizontal directions, global X & global Z and also along vertical direction, global Y.

Time period in X direction: $T_x = 0.09734$ sec.

Time period in Z direction: $T_z = 0.51406$ sec.

Time Period, T, is calculated by the Rayleigh Method

As per Table 15 of IS 1893 (Part 4): 2015

Damping Factor (DF) for 2% damping = 1.4

From figure 1 of IS 1893 (Part 4): 2015, for Hard Soil sites for (0 second <T<0.1 second)

Spectral acceleration coefficient value (S_a/g) in X, Z, and Y directions for 2% damping:

$$\frac{S_a}{g}_x = DF \times \left(1 + 15T\right) = 1.4 \times \left[1 + \left(15 \times 0.09734\right)\right] = 3.444$$

From figure 1 of IS 1893 (Part 4): 2015, for Hard Soil sites for (0.4 second <T<10 second)

$$\frac{S_a}{g}_z = DF \times \frac{1}{T} = 1.4 \times \frac{1}{0.51406} = 2.723$$

As per clause 10.2 of IS 1893 (Part 4): 2015

$$\frac{S_a}{g}_y = \frac{2}{3} \times Maximum\ of \left(\frac{S_a}{g}_x, \frac{S_a}{g}_z\right) = \frac{2}{3} \times 3.444 = 2.296$$

As per clause 7.3.2 of IS 1893 (Part 4): 2015

The seismic coefficient in X, Z and Y direction

$$A_{h\_x} = \frac{Z}{2} \times \frac{I}{R} \times \frac{S_a}{g}_x = \frac{0.36}{2} \times \frac{1}{5} \times 3.444 = 0.124$$

$$A_{h\_z} = \frac{Z}{2} \times \frac{I}{R} \times \frac{S_a}{g}_z = \frac{0.36}{2} \times \frac{1}{5} \times 2.723 = 0.098$$

$$A_{h\_y} = \frac{Z}{2} \times \frac{I}{R} \times \frac{S_a}{g}_y = \frac{0.36}{2} \times \frac{1}{5} \times 2.296 = 0.083$$

Node	W (kN)	Design lateral force in X direction $Q_x = W_x \times A_{h\_x}$	Design lateral force in Z direction $Q_z = W_z \times A_{h\_z}$	Design force in Y direction $Q_y = W_y \times A_{h\_y}$
2	15	(15 × 0.124) = 1.860	(15 × 0.098) = 1.471	(15 × 0.083) = 1.240

V. IS 1893 2002 Response Spectrum

Calculation of base shear and its distribution along the height for response spectrum method in IS 1893 (Part 1) : 2002.

Problem

A three story building is modelled in STAAD.Pro considering the following:

Seismic zone factor, $Z = 0.36$
Importance factor, $I = 1$
Response reduction factor, $R = 5$
Soil site conditions = Hard

The generated model is subjected to a response spectrum load along global X direction. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Natural Frequency/Time Period Information & Mode Shapes (Obtained from output file)

Table 526: Natural Frequencies/Time Period

Mode	Frequency (cyc/sec)	Time Period (sec)

V. IS 1893 2002 Static Seismic

Calculation of base shear and its distribution along the height for equivalent static method in IS 1893 (Part 1) : 2002

Problem

A reinforced concrete frame structure is 4 bays at 4m ea. by 3 bays at 4m ea. in plan. The structure is 3 stories at 3m ea.

The structure is modelled in STAAD.Pro considering the following:

Seismic zone factor, $Z = 0.36$ (`ZONE 0.36`)
Importance factor, $I = 1$ (`I 1`)
Response reduction factor, $R = 5$ (`RF 5`)
Soil site condition = Hard (`SS 1`)
Structure type is a reinforced concrete frame (`ST 1`)

The seismic weight for each floor is assumed as 100 kN applied as joint weight to nodes 39, 60, & 80. Seismic Loads as per IS 1893 (Part 1) : 2002 specifications are generated along two horizontal directions global X & global Z. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Height = 3 × 3 = 9m

$$Ta_x = 0.075h^{0.75} = 0.075 \times (9^{0.75}) = 0.39 \text{ sec}$$

$$Ta_z = 0.075h^{0.75} = 0.075 \times (9^{0.75}) = 0.39 \text{ sec}$$

$$[Sa/g]_x = [Sa/g]_z = 2.5 \text{ (As time period < 0.4 sec)}$$

$$Ah_x = (Z/2) \times (I/R) \times [Sa/g]_x = 0.36/2 \times 1/5 \times 2.5 = 0.09$$

$$Ah_z = (Z/2) \times (I/R) \times [Sa/g]_z = 0.36/2 \times 1/5 \times 2.5 = 0.09$$

$$VB = Ah \times W$$

$$VB_x = Ah_x \times W = 0.09 \times (3 \times 100) = 27 \text{ kN}$$

$$VB_z = Ah_z \times W = 0.09 \times (3 \times 100) = 27 \text{ kN}$$

Story Level	Wi	hi	$Wi \times hi^2$	$(Wi \times hi^2)/\sum(Wi \times hi^2)$	Qx	Qz

V. Moving Load

V. Moving Load Generator

To validate the effect of wheel load assembly on bridge girders simulated by a series of equivalent concentrated loads for a particular wheel position, generated by Moving Load generation option.

Details

A bridge decking system of 10m span is simulated by three longitudinal girder of size 0.3m×0.6m (Concrete) at a spacing of 2m and six transverse girders of size 0.3m×0.45m (Concrete) at a spacing of 2m. Longitudinal girders are pinned support at both the ends.

Vehicle definition – 10 kN and 16 kN per wheel in the Front and Rear Axle respectively. The vehicle width is 1.2m and the axle distance is 1.5m. Starting position is from the end of the deck, aligning the rear axle along the last transverse girder. The direction of movement along the longitudinal girder with an incremental distance of 0.5m.

Validation

Among the generated wheel loads, for the 9th position of the wheel assembly, the structure is analyzed for that generated load. The structure is again analyzed with the static load system equivalent to the generated wheel load and observed the difference in results if any.

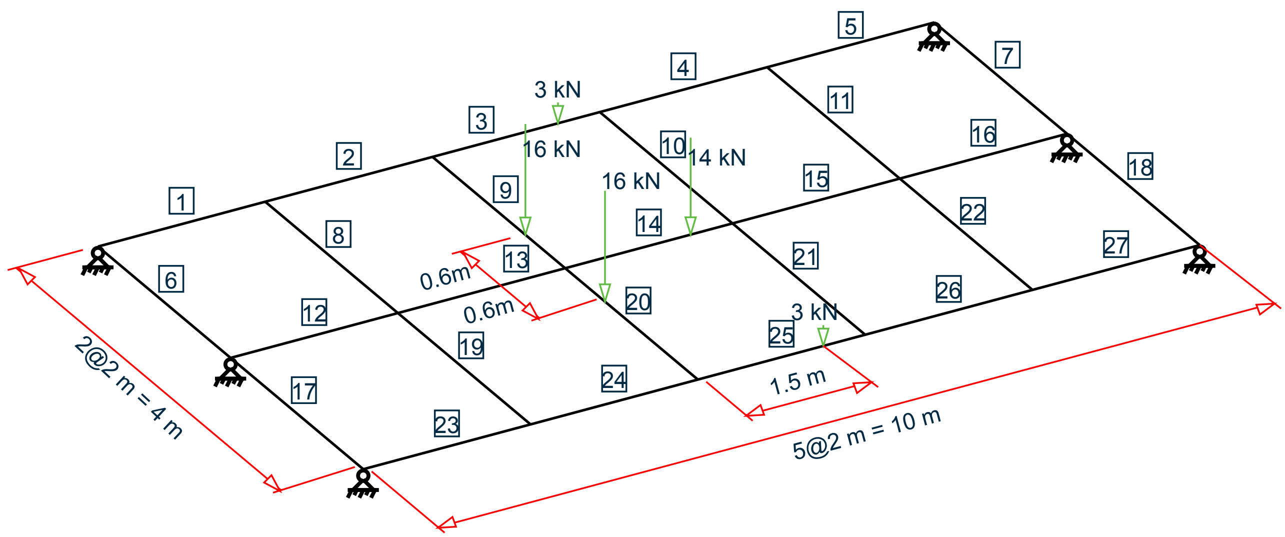

Figure 436: The position of the generated load case 9

Note: The postprocessing diagrams in STAAD.Pro show two overlapping 7 kN axle reactions on member 14.

The model uses the moving load generator facility and a static load equivalent to the generated Load Case 9 (i.e., 9th position of the wheel assembly). Both support reactions and joint displacements are compared.

Comparison

Table 531: Comparison of results

Parameter	STAAD.Pro	Reference	Difference	Comments
Support reaction at joint 7 (kN)	11.37	11.37	none	
Vertical displacement at joint 10 (cm)	0.3025	0.3025	none	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\06 Loading\Moving Load\Moving Load Generator.STD` is typically installed with the program.

V. NRC

V. NRC 2010 Response Spectrum

Calculation of Base Shear for Response Spectrum Method in NBCC/NRC 2010.

Details

Example 4.7(1) is modeled in STAAD.Pro.

The generated model is subjected to a Response Spectrum Load along global X direction. Time-Acceleration pairs for the spectrum data can be seen in supporting excel file `NRC_Calculation.xlsx` within worksheet named RS Values. The direction factor along global X direction is assumed as 0.5. The base shear reported by STAAD.Pro is verified against hand calculation.

Validation

Natural Frequency/Time Period Information & Mode Shapes (Obtained from output file)

Table 532: Natural Frequencies/Time Period

Mode	Frequency (cyc/sec)	Time Period (sec)
1	3.332	0.30014
2	9.103	0.10986
3	12.435	0.08042

Table 533: Mode Shapes

V. NRC 2010 Static Seismic

Calculation of base shear and its distribution along the height for equivalent static force method in NBCC/NRC 2010.

Problem

Structure to be modelled:

height = 3× 5m = 15m
plan dimension X = 5m
plan dimension Z = 5m

Input parameters:

Seismic acceleration values Sa(0.2) = 0.28, Sa(0.5) = 0.17, Sa(1.0) = 0.11, and Sa(2) = 0.063 (`SA1 0.28`, `SA2 0.17`, `SA3 0.11`, `SA4 0.063`)
Importance factor = 1.3 (`I 1.3`)
Site class C (`SCL 3`)
Higher mode factor X = 1 (`MVX 1`)
Higher mode factor Z = 1 (`MVZ 1`)
Ductility-related force modification factor X = 5 (`RDX 5`)
Ductility-related force modification factor Z = 5 (`RDZ 5`)
Overstrength-related force modification factor X = 5 (`ROX 1.5`)
Overstrength-related force modification factor Z = 5 (`ROZ 1.5`)
Moment resisting frames in both X and Z directions (`STX 1`, `STZ 1`)
Provisions to be checked for member strength (`MD 1`)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 6 7 9 To 16. Seismic Load as per NBCC/NRC 2010 specifications are generated along horizontal direction global X and global Z. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

$Ta_x = 0.075\times(hn)^{0.75}$ (for concrete moment frames) $= 0.075 \times 15^{0.75} = 0.57$ sec

$Ta_z = 0.075\times(hn)^{0.75}$ (for concrete moment frames) $= 0.075 \times 15^{0.75} = 0.57$ sec

Tc_x (Rayleigh method from output file) = 0.467, Tc_z (Rayleigh method from output file) = 0.467

$$1.5 \times Ta_x = 0.86 > Tc_x \text{ so } Ta_{used} = Tc_x = 0.467$$

$$1.5 \times Ta_z = 0.86 > Tc_z \text{ so } Ta_{used} = Tc_z = 0.467$$

Fa = 1 (For Site Class = C and Sa(0.2) = 0.28)

Fv = 1 (For Site Class = C and Sa(1.0) = 0.11)

S(0.2) = Fa × Sa(0.2) = 1 × 0.28 = 0.28

S(0.5) = smaller of Fv × Sa(0.5) and Fa × Sa(0.2) = smaller of 1 x 0.17 and 1 × 0.28 = 0.17

$S(Ta_{used})_x = S(Ta_{used})_z$ = 0.17 + ((0.28-0.17)/(0.5-0.2) × (0.5-0.467)) = 0.1821

Vx = $S(Ta_{used})_x$ × MVX × I × W / RDX × ROX = 0.1821 × 1 × 1.3 × (200x3) / 5 × 1.5 = 18.9384 kN

Min Base Shear = S(2.0) × MVX × I × W / (RDX × ROX) = 0.063 × 1 x 1.3 × (200x3) / 5 × 1.5 = 6.552 kN

Max Base Shear = 2/3 × S(0.2) × I × W / (RDX × ROX) = 2/3 × 0.28 x 1.3 × (200x3) / 5 × 1.5 = 19.413 kN

Vx > Min Base Shear & Vx < Max Base Shear, Vx = 18.9384 kN

Vz = $S(Ta_{used})_z$ × MVZ × I × W / RDZ × ROZ = 0.1821 × 1 × 1.3 × (200x3) / 5 × 1.5 = 18.9384 kN

Min Base Shear = S(2.0) × MVZ × I × W / (RDZ × ROZ) = 0.063 × 1 x 1.3 × (200x3) / 5 × 1.5 = 6.552 kN

Max Base Shear = 2/3 × S(0.2) × I × W / (RDZ × ROZ) = 2/3 × 0.28 x 1.3 × (200x3) / 5 × 1.5 = 19.413 kN

Vz > Min Base Shear & Vz < Max Base Shear, Vz = 18.9384 kN

Since fundamental lateral period < 0.7 sec Ft = 0, calculated Base Shear is distributed along the height as under:

Fx = (V - 0) × (Wx × hx / ∑ Wi × hi) = (V) × (Wx × hx / ∑ Wi × hi)

Story Level	Wi	hi	*Wi × hi*	*(Wi × hi)/∑ (Wi × hi)*	Fx	Fz
Roof	200	15	3,000	0.5	9.469	9.469
2nd	200	10	2,000	0. 333	6.313	6.313
1st	200	5	1,000	1.667	3.156	3.156
Summation	600		6,000			
V					18.938	18.938

Comparison

Table 538: Comparison of results

Parameter		Hand Calculation	STAAD.Pro	Difference	Comments
Story shear (kN)	X, 1st	3.156	3.159	Negligible

V. NRC 2005 Response Spectrum

Calculation of Base Shear for Response Spectrum Method in NBCC/NRC 2005.

Details

Example 4.7(1) is modeled in STAAD.Pro.

The generated model is subjected to a Response Spectrum Load along global X direction. Time-Acceleration pairs for the spectrum data can be seen in supporting excel file `NRC_Calculation.xlsx` within worksheet named RS Values. The direction factor along global X direction is assumed as 0.5. The base shear reported by STAAD.Pro is verified against hand calculation.

Validation

Natural Frequency/Time Period Information & Mode Shapes (Obtained from output file)

Table 539: Natural Frequencies/Time Period

Mode	Frequency (cyc/sec)	Time Period (sec)
1	3.332	0.30014
2	9.103	0.10986
3	12.435	0.08042

Table 540: Mode Shapes

Mode	Story Level/ Joint Numbers	X-Trans	Y-Trans	Z-Trans	X-Rot	Y-Rot	Z-Rot

V. NRC 2005 Static Seismic

Calculation of base shear and its distribution along the height for equivalent static force method in NBCC/NRC 2005.

Problem

Structure to be modelled:

height = 3× 5m = 15m
plan dimension X = 5m
plan dimension Z = 5m

Input parameters:

Seismic acceleration values Sa(0.2) = 0.28, Sa(0.5) = 0.17, Sa(1.0) = 0.11, and Sa(2) = 0.063 (`SA1 0.28`, `SA2 0.17`, `SA3 0.11`, `SA4 0.063`)
Importance factor = 1.3 (`IE 1.3`)
Site class C (`SCL 3`)
Higher mode factor X = 1 (`MVX 1`)
Higher mode factor Z = 1 (`MVZ 1`)
Numerical reduction coefficient for base overturning X = 1 (`JX 1`)
Numerical reduction coefficient for base overturning Z = 1 (`JZ 1`)
Ductility-related force modification factor X = 5 (`RDX 5`)
Ductility-related force modification factor Z = 5 (`RDZ 5`)
Overstrength-related force modification factor X = 5 (`ROX 1.5`)
Overstrength-related force modification factor Z = 5 (`ROZ 1.5`)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 6 7 9 To 16. Seismic Load as per NBCC/NRC 2005 specifications are generated along horizontal direction global X and global Z. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Ta_x = 0.075*(hn)^0.75 (for concrete moment frames) = $0.075 \times 15^{0.75}$ = 0.571649342 sec

$Ta_z = 0.075*(hn)^{0.75}$ (for concrete moment frames) = $0.075 \times 15^{0.75}$ = 0.571649342 sec

Tc_x (Rayleigh method from output file) = 0.467, Tc_z (Rayleigh method from output file) = 0.467

$$1.5 \times Ta_x = 0.857474013 > Tc_x \text{ so } Ta_{used} = Tc_x = 0.467$$

$$1.5 \times Ta_z = 0.857474013 > Tc_z \text{ so } Ta_{used} = Tc_z = 0.467$$

Fa = 1 (For Site Class = C and Sa(0.2) = 0.28)

Fv = 1 (For Site Class = C and Sa(1.0) = 0.11)

$$S(0.2) = Fa \times Sa(0.2) = 1 \times 0.28 = 0.28$$

S(0.5) = smaller of Fv × Sa(0.5) and Fa × Sa(0.2) = smaller of 1 × 0.17 and 1 × 0.28 = 0.17

$S(Ta_{used})_x = S(Ta_{used})_z$ = 0.17 + ((0.28-0.17)/(0.5-0.2) × (0.5-0.467)) = 0.1821

Vx = $S(Ta_{used})_x$ × MVX × I × W / RDX × ROX = 0.1821 × 1 × 1.3 × (200×3) / 5 × 1.5 = 18.9384 kN

Min Base Shear = S(2.0) × MVX × I × W / (RDX × ROX) = 0.063 × 1 × 1.3 × (200×3) / 5 × 1.5 = 6.552 kN

Max Base Shear = 2/3 × S(0.2) × I × W / (RDX × ROX) = 2/3 × 0.28 × 1.3 × (200×3) / 5 × 1.5 = 19.413 kN

Vx > Min Base Shear & Vx < Max Base Shear, Vx = 18.9384 kN

Vz = $S(Ta_{used})_z$ × MVZ × I × W / RDZ × ROZ = 0.1821 × 1 × 1.3 × (200×3) / 5 × 1.5 = 18.9384 kN

Min Base Shear = S(2.0) × MVZ × I × W / (RDZ × ROZ) = 0.063 × 1 × 1.3 × (200×3) / 5 × 1.5 = 6.552 kN

Max Base Shear = 2/3 × S(0.2) × I × W / (RDZ × ROZ) = 2/3 × 0.28 × 1.3 × (200×3) / 5 × 1.5 = 19.413 kN

Vz > Min Base Shear & Vz < Max Base Shear, Vz = 18.9384 kN

Since fundamental lateral period < 0.7 sec Ft = 0, calculated Base Shear is distributed along the height as under:

$$Fx = (V - 0) \times (Wx \times hx / \sum Wi \times hi) = (V) \times (Wx \times hx / \sum Wi \times hi)$$

Story Level	Wi	hi	$Wi \times hi$	$(Wi \times hi)/\sum(Wi \times hi)$	Fx	Fz

V. UBC

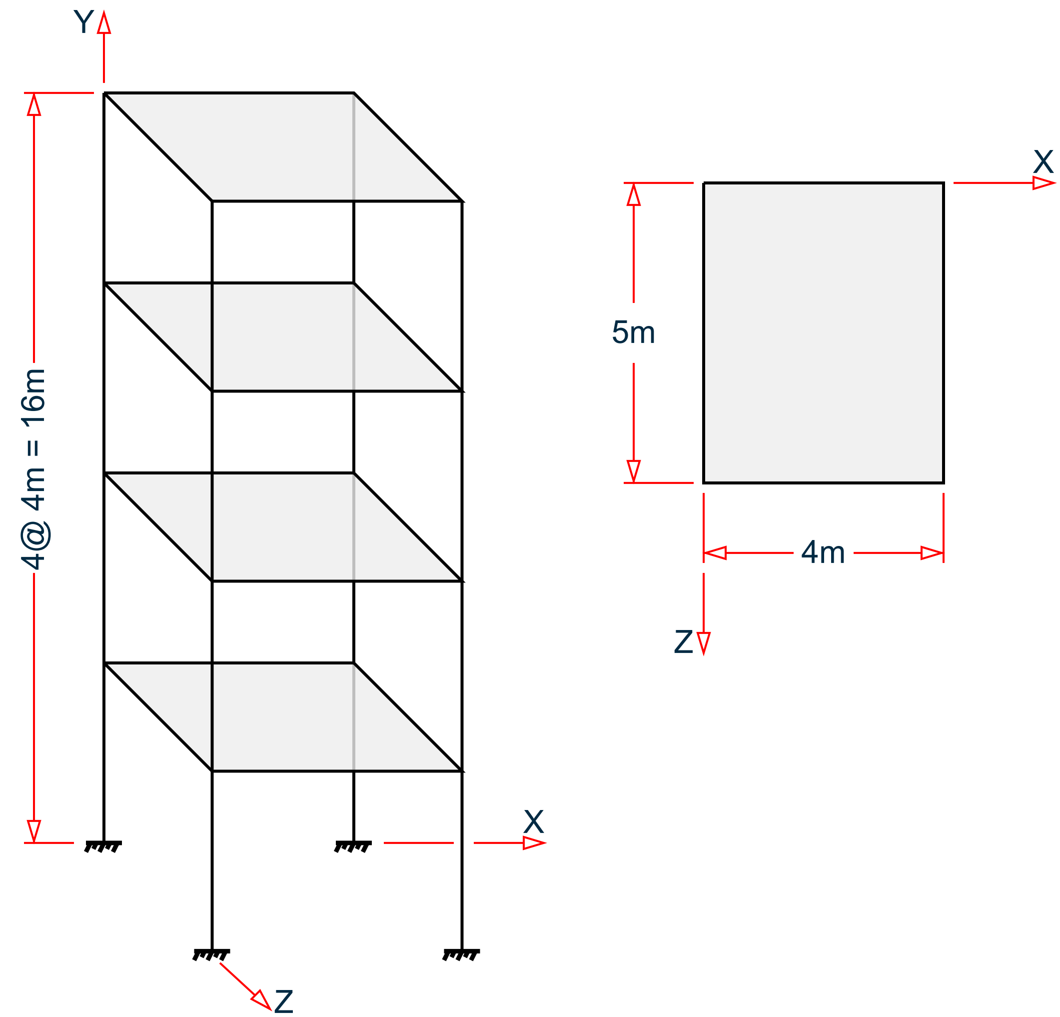
V. UBC 1997 Static Seismic

Calculation of base shear and its distribution along the height for equivalent lateral force method in UBC 1997.

Problem

Structure to be modelled:

height = 4× 4m = 16m
plan dimension X = 4m
plan dimension Z = 5m



Input parameters:

Zone = 0.4
Importance factor = 1.0
Response modification factor X = 3.5
Response modification factor Z = 3.5
Site type = 3
Building period coefficient, C_T = 0.0731
Near source factor, N_a = 1.5
Near source factor, N_v = 2

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per UBC 1997 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Calculations

Structure period calculation:

A. Height = $hn = 16m$, $Ta = C_T \times hn^x = 0.0731 \times 16^{0.75} = 0.585$,

B. Tb (from output file) = 1.286

Since Zone = 0.4 & Tb > 1.3 x Ta; T = Ta = 0.585

For STYP = 3 & Zone = 0.4; Ca = 0.4 x NA = 0.4 x 1.5 = 0.6

For STYP = 3 & Zone = 0.4; Cv = 0.56 x NV = 0.56 x 2 = 1.12

Design base shear calculation:

$$V = Cv/R \times I/T \times W = 1.12/3.5 \times 1/0.585 \times (200 \times 4) = 0.547 \times 800 = 437.6 \text{ kN}$$

$$V_{\text{Upper Limit}} = (2.5 \times Ca \times I)/R \times W = (2.5 \times 0.6 \times 1)/3.5 \times (200 \times 4) = 0.4286 \times 800 = 342.88 \text{ kN}$$

$$V_{\text{lower limit}} = \max \left| \begin{array}{l} 0.11 \times C_a \times I \times W = 0.11 \times 0.6 \times 1 \times (200 \times 4) = 0.066 \times 800 = 52.8 \text{ kN} \\ 0.8 \times Z \times N_v \times I / R \times W = 0.8 \times 0.4 \times 2 \times 1 / 3.5 \times (200 \times 4) \\ \quad = 0.1829 \times 800 = 146.3 \text{ kN} \end{array} \right.$$

Hence Design Base Shear V = 342.88 kN

Lateral seismic force $Fx = (W_x \times h_x \,/\, \sum W_i \times h_i) \times (V - F_t)$

Since $T = 0.585 < 0.7$ sec, $F_t = 0$

Story Level	W_i	h_i	$W_i \times h_i$	$(W_i \times h_i)/\sum(W_i \times h_i)$	F_x

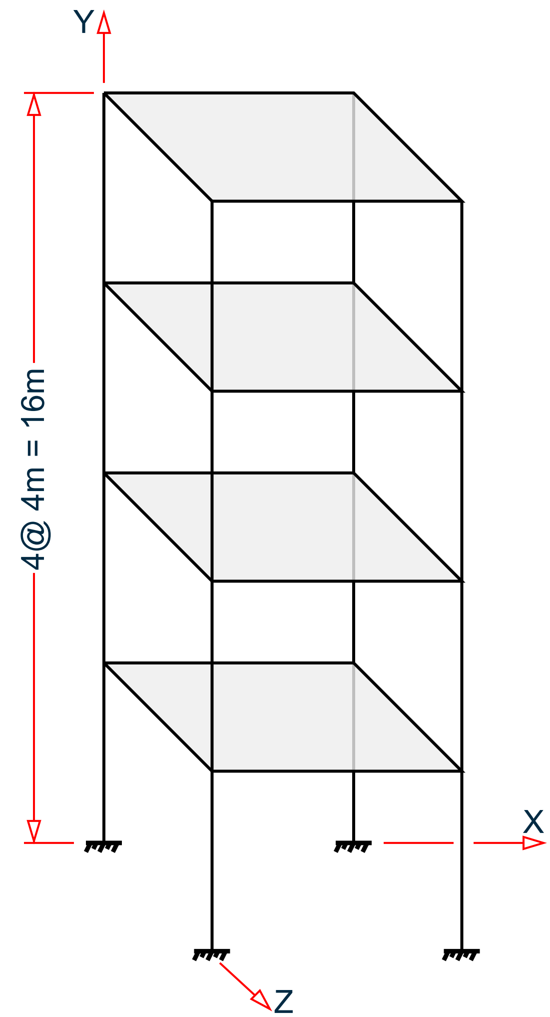
V. UBC 1994 Static Seismic

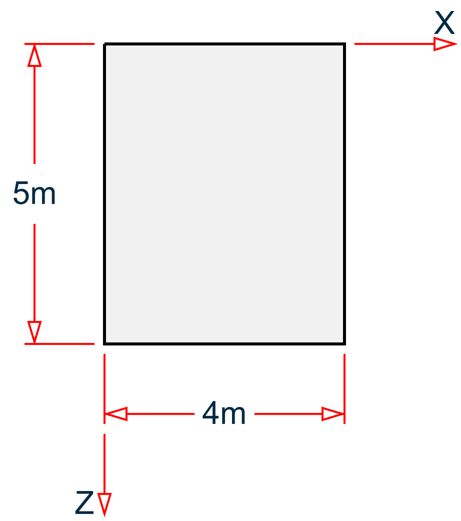
Calculation of base shear and its distribution along the height for equivalent lateral force method in UBC 1994.

Problem

Structure to be modelled:

height = 4× 4m = 16m
plan dimension X = 4m
plan dimension Z = 5m





Input parameters:

Zone = 0.4
Site coefficient, S = 1
Building period coefficient, C_T = 0.0731
Importance factor = 1.0 (`I 1.0`)
Response modification factor X = 3 (`RX 3`)
Response modification factor Z = 3 (`RX 3`)

The seismic weight for each floor is assumed as 200 kN applied as joint weight of 50kN to nodes 2 3 5 6 8 9 11 To 20. Seismic Load as per UBC 1994 specifications are generated along horizontal direction global X. The base shear and its distribution along height reported by STAAD.Pro is verified against hand calculation.

Calculations

Structure period calculation:

A. Height = $hn = 16m, Ta = C_T \times hn^x = 0.0731 \times 16^{0.75} = 0.585,$
B. Tb (from output file) = 1.286

T_{used} = 0.585

$$C = 1.25 \times S / (T^{2/3}) = 1.25 \times 1 / (0.585^{2/3}) = 1.787$$

Design base shear calculation:

$$V = (Z \times I \times C / R_{wx}) \times W = (0.4 \times 1 \times 1.787 / 3) \times (200 \times 4) = 0.2383 \times 800 = 190.62 \text{ kN}$$

Lateral seismic force $Fx = (W_x \times h_x \ / \ \sum W_i \times h_i) \times (V - F_t)$
Since $T = 0.585 < 0.7\ sec, F_t = 0$

Story Level	W_i	h_i	$W_i \times h_i$	$(W_i \times h_i)/\sum(W_i \times h_i)$	F_x
Roof	200	16	3,200	0.4	76.25
3rd	200	12	2,400	0.3	57.19
2nd	200	8	1,600	0.2	38.12
1st	200	4	800	0.1	19.06
Summation	800		8,000	1	
V_x	190.62				

Comparison

Table 547: Comparison of results

Parameter		Hand Calculation	STAAD.Pro	Difference	Comments
Story shear, F_x (kN)	1st	19.06	19.062	negligible	
	2nd	38.12	38.124	negligible	
	3rd	57.19	57.200	negligible	
	roof	76.25	76.267	negligible	
Base shear, V_x (kN)		190.62	190.67	negligible	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\06 Loading\UBC\UBC 1994 Static Seismic.STD` is typically installed with the program.

V. Wind Load

V. ASCE 7-16 Wind Load Generation on Building

Verify the windward loads due to wind on a portion of a building structure calculated per the ASCE 7-16 specification.

Details

The wind load is calculated for a building structure using the direction procedure for MWFRS of enclosed buildings (ASCE 7-16, Chapter 27). The following assumptions and parameters apply:

Flat roof type
Category II building (Table 1.5-1)
Basic wind speed = 108 mph
Ground height above sea level = 230 ft
Structure type of “building”
Exposure Category B
Do not consider wind speed-up over hills or escarpments
Building height = 40 ft
Building length along the wind direction, L = 30 ft
Building width normal to wind direction, B = 25 ft
Natural frequency of structure = 2 Hz (i.e., a “rigid” building per Cl. 26.2)
Damping ratio = 0.01

Enclosed building

The portion of the building below 20' in height is blocked by an adjacent structure or other obstruction. Calculate the resulting joint loads on the *windward* side due to wind along the X axis at the upper wall of one segment of the building.

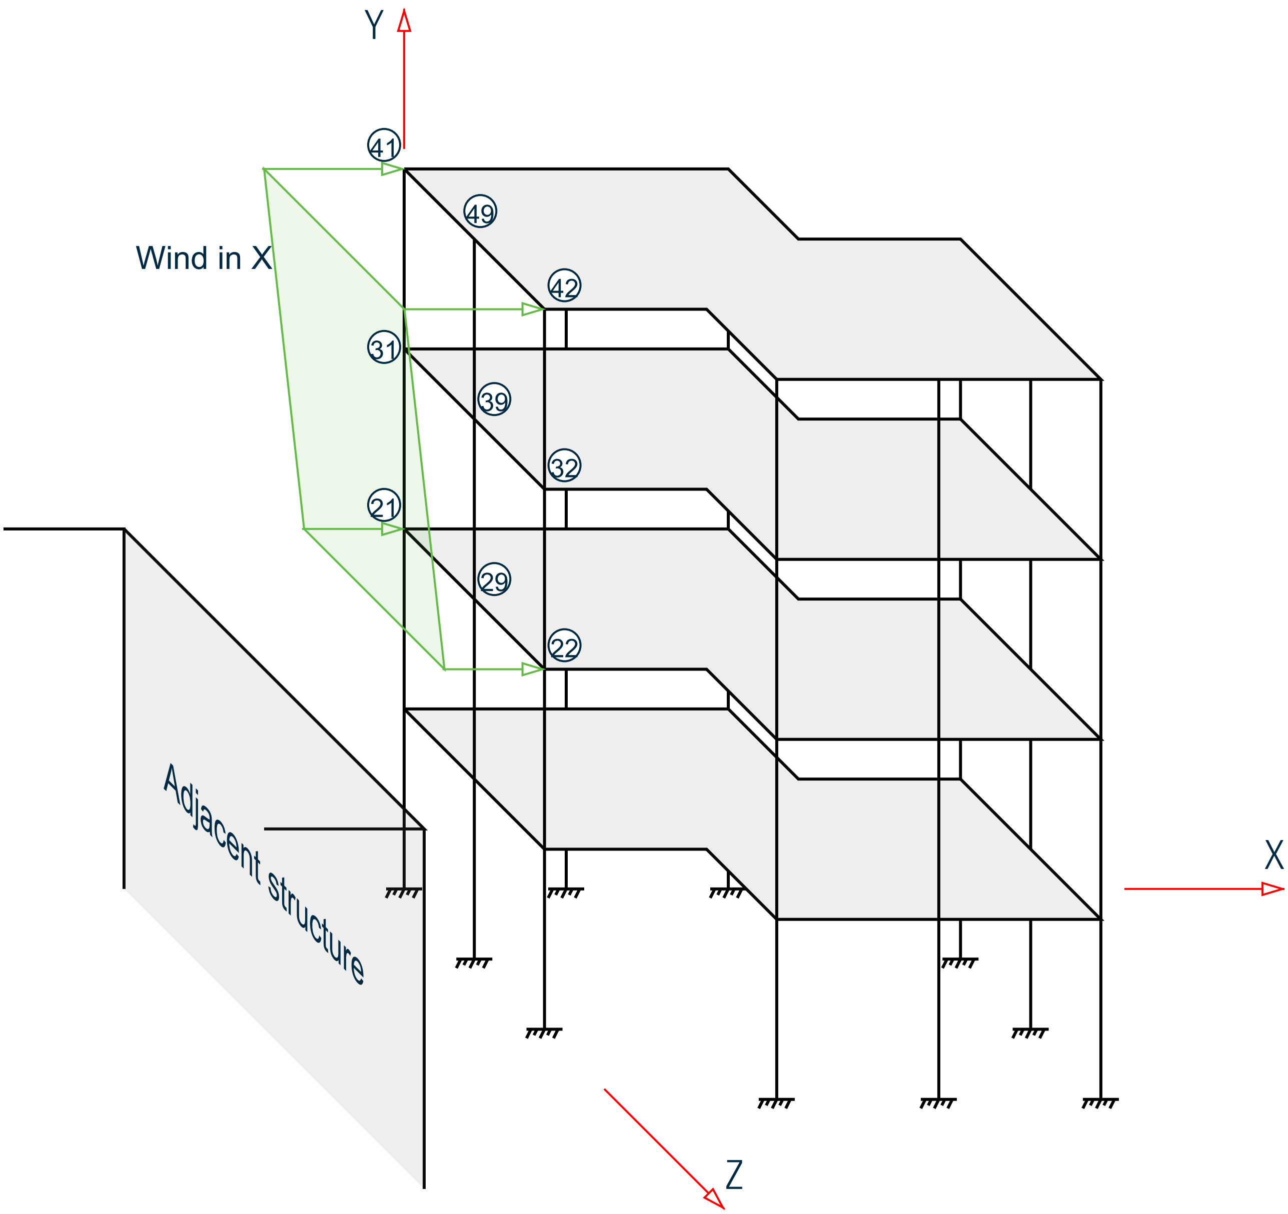

Figure 437: Building structure with portion of wind load

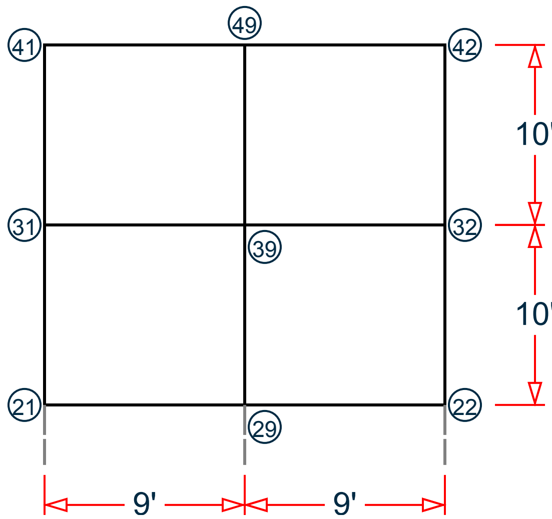

Figure 438: Elevation of loaded area investigated

Validation

Directionality factor, $K_d = 0.85$ (Table 26.6-1)

Topographic factor, $K_{zt} = 1.0$

Ground elevation factor, $K_e = e^{-0.0000362 \times 230} = 0.9917$ (Table 26.9-1)

The velocity pressure exposure coefficients (K^z) are calculated per the formulae given in Table 26.10-1:

$$K_z = \begin{cases} 2.01(15/z_g)^{2/a} & \text{for } z < 15 \text{ ft} \\ 2.01(z/z_g)^{2/a} & \text{for } 15 \text{ ft } \leq z \leq zg \end{cases} \qquad \text{(Table 26.10.1)}$$

where

a	=	7
z_g	=	1,200 ft

See the table below for the values of K^z *at discrete values of z.*

Velocity pressure, q_z

$$q_z = 0.00256 \times K_z K_{zt} K_d K_e V^2 \qquad \text{(Cl. 26.10-1)}$$

Mean roof height = height of the building = 40 ft. Refer to table below for calculation of q_z at the mean roof height.

Gust effect factor, G

G is calculated per Cl. 26.11.4 for rigid structures:

$$G = 0.925\left(\frac{1 + 1.7 g_q I_{\bar{z}} Q}{1 + 1.7 g_v I_{\bar{z}}}\right) \qquad \text{(Cl. 26.11.4)}$$

where

$g_q = g_v$	=	3.4
$\bar{z}$	=	$max \begin{vmatrix} 30 \text{ ft} \\ 0.6 \times h \end{vmatrix} = 30 \text{ ft}$

ε	=	1/3
ℓ	=	320 ft
c	=	0.3
$L_{\bar{z}}$	=	$\ell(\bar{z} / 33)^{\varepsilon} = 309.99\ ft$
Q	=	$\sqrt{\dfrac{1}{1 + 0.63\left(\dfrac{B+h}{L_{\bar{z}}}\right)^{0.63}}} = \sqrt{\dfrac{1}{1 + 0.63\left(\dfrac{25+40}{309.99}\right)^{0.63}}} = 0.8997$
$I_{\bar{z}}$	=	$c(33 / \bar{z})^{1/6} = 0.3048$

Therefore, $G = 0.925\left(\dfrac{1 + 1.7 \times 3.4 \times 0.3048 \times 0.8997}{1 + 1.7 \times 3.4 \times 0.3048}\right) = 0.8658$

Wall pressure coefficient, $C_p = 0.8$ for windward per Fig. 27.3-1.

The external design pressure, $p = q_h G C_p$.

The internal pressure coefficient, $GC_{pi} = -0.18$ for partially enclosed buildings per Table 26.13-1.

The internal design pressure, $p_i = q_i(GC_{pi}) = 19.14 \times -0.18 = -3.45\ lb/ft^2$

where

q_i	=	the velocity pressure evaluated at the building height, h, = q_h

The design wind pressure, p, is then calculated as:

$$p = q_z G C_p - q_i(GC_{pi}) \quad \text{(Eq. 29.4-1)}$$

Table 548: Wind intensity versus height for building structure

h (ft)	K_z	q_z (lb/ft^2)	p (lb/ft^2)
0	0.575	14.47	13.47
15	0.575	14.47	13.47
20	0.624	15.71	14.32
25	0.665	16.74	15.04
30	0.701	17.63	15.66
35	0.732	18.43	16.21
40	0.761	19.14	16.71

Note: To compare different wind load calculations with STAAD.Pro, the tributary areas below are selected based on the applied wind area defined in the model. These do *not* include any surrounding wind areas outside of the indicated area, which would have wind applied in a typical situation.

Load on Nodes 21 and 22

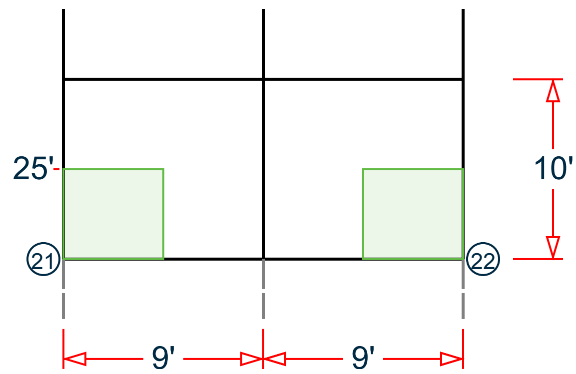

Figure 439: Tributary area for nodes 21 and 22

Wind pressure at half-way between this node and level above (25') = 15.04 lb/ft^2.

$$F = (9\text{ ft} / 2) \times (10\text{ ft} / 2) \times 15.04\text{ lb/ft}^2\ (10)^{-3} = 0.338\text{ kips}$$

<u>Load on Nodes 31 and 32</u>

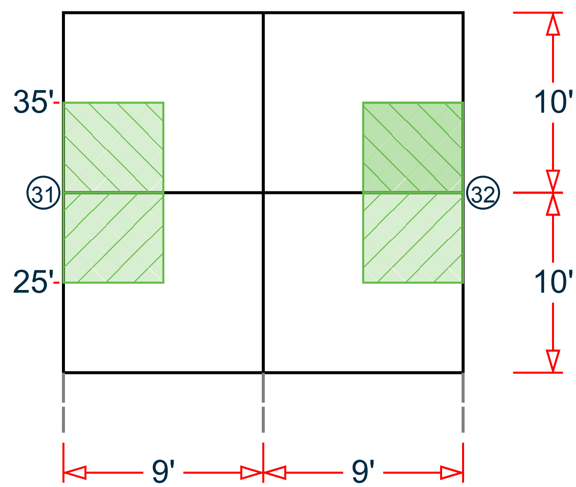

Figure 440: Tributary area for nodes 31 and 32

Wind pressure at half-way between this node and level below (25') = 15.04 lb/ft^2.

Wind pressure at half-way between this node and level above (35') = 16.21 lb/ft^2.

$$F = (9\text{ ft} / 2) \times (10\text{ ft} / 2) \times (15.04\text{ lb/ft}^2 + 16.21\text{ lb/ft}^2)\ (10)^{-3} = 0.703\text{ kips}$$

<u>Load on Nodes 41 and 42</u>

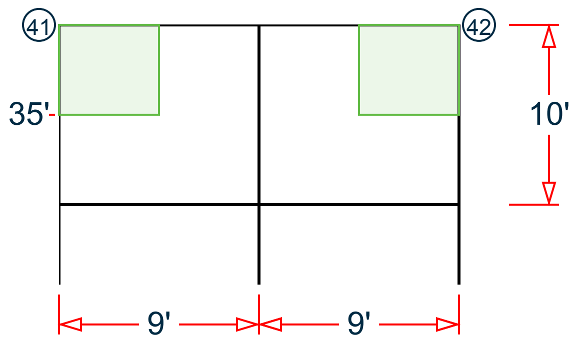

Figure 441: Tributary area for nodes 41 and 42

Wind pressure at roof level (40') = 16.71 lb/ft^2.

$$F = (9\ \text{ft} / 2) \times (10\ \text{ft} / 2) \times (16.71\ \text{lb/ft}^2)\ (10)^{-3} = 0.376\ \text{kips}$$

Load on Node 29

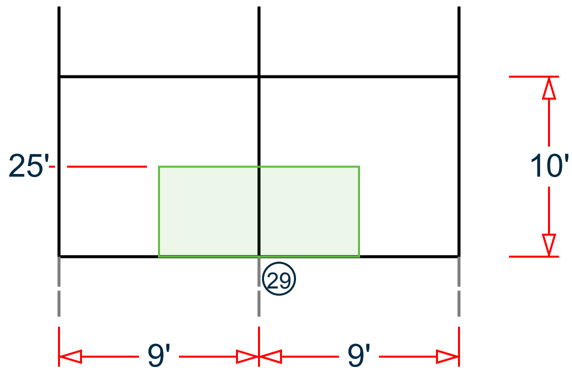

Figure 442: Tributary area for node 29

Wind pressure at half-way between this node and level above (25') = 15.04 lb/ft^2.

$$F = (9\ \text{ft}) \times (10\ \text{ft} / 2) \times 15.04\ \text{lb/ft}^2\ (10)^{-3} = 0.677\ \text{kips}$$

Load on Node 39

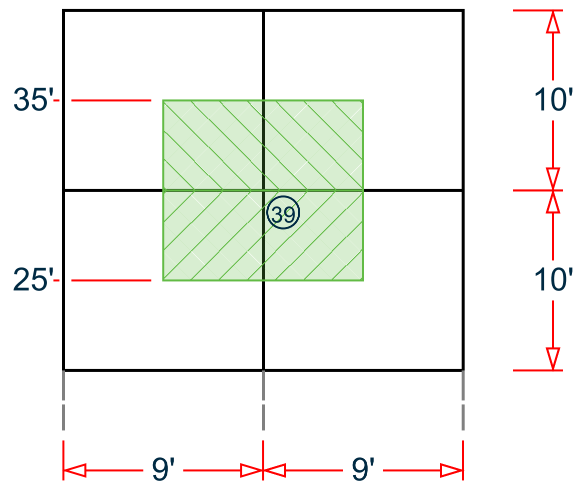

Figure 443: Tributary area for node 39

Wind pressure at half-way between this node and level below (25') = 15.04 lb/ft^2.

Wind pressure at half-way between this node and level above (35') = 16.21 lb/ft^2.

$$F = (9 \text{ ft}) \times (10 \text{ ft} / 2) \times (15.04 \text{ lb/ft}^2 + 16.21 \text{ lb/ft}^2)\ (10)^{-3} = 1.406 \text{ kips}$$

<u>Load on Node 49</u>

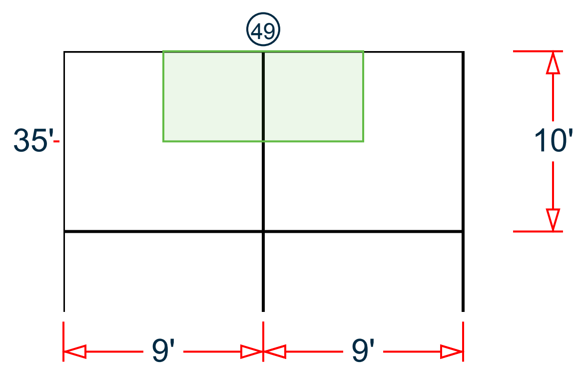

Figure 444: Tributary area for node 49

Wind pressure at roof level (40') = 16.71 lb/ft^2.

$$F = (9 \text{ ft}) \times (10 \text{ ft} / 2) \times (16.71 \text{ lb/ft}^2)\ (10)^{-3} = 0.752 \text{ kips}$$

V. ASCE 7-16 Wind Load Generation on Tank

Verify the windward loads due to wind on a portion of a tank structure calculated per the ASCE 7-16 specification.

Details

The wind load is calculated for a tank structure using the direction procedure for MWFRS of enclosed buildings (ASCE 7-16, Chapter 27). The following assumptions and parameters apply:

Category II building (Table 1.5-1)
Basic wind speed = 108 mph
Ground height above sea level = 520 ft
Structure type of “chimney, tank, or similar structure”
Exposure Category B
Wind speed-up over hills or escarpments is considered: a two-dimension ridge of height, $H = 300\ ft$. The distance upwind of crest, $L_h = 650\ ft$ and the distance from crest to the building, $x = 750\ ft$
Height of tank = 40 ft
The least horizontal dimension (W or D), D = 25 ft
Round axisymmetric horizontal cross-section
Depth of protruding elements, $D' = 0.5\ ft$
Natural frequency of structure = 2 Hz (i.e., a “rigid” building per Cl. 26.2)
Damping ratio = 0.01

Determine the wind loads acting on a vertical portion of the upper tank structure at a two-panel segment tangent to the YZ plane. For the purpose of this example, the contributions of the surrounding tank portions are ignored (i.e., only the portions of the wind area in this segment are calculated for brevity).

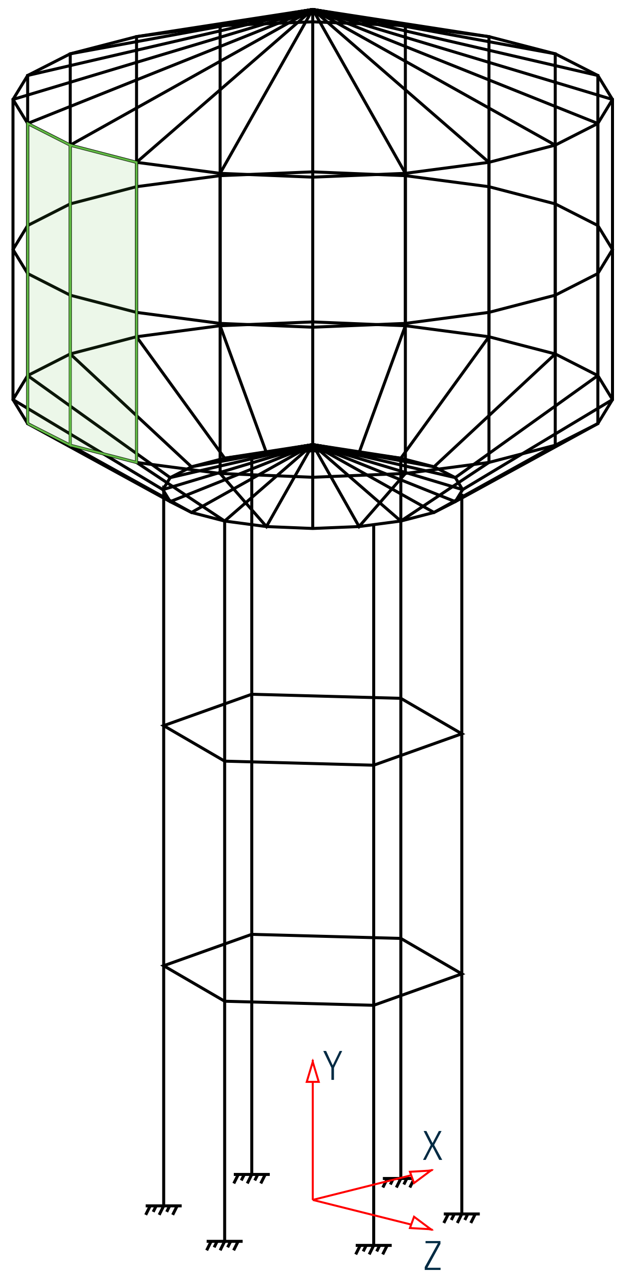

Figure 445: Wind load portion considered on tank structure

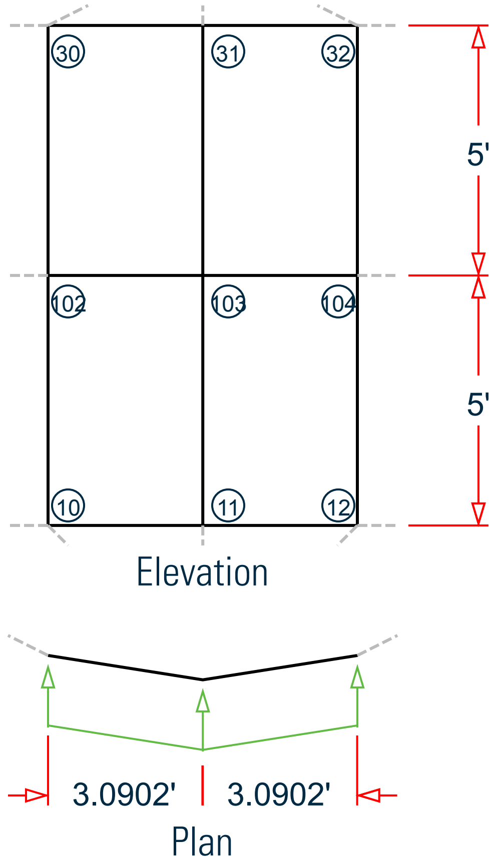

Figure 446: Loaded area plan and elevation

Validation

Directionality factor, $K_d = 1.0$ (Table 26.6-1)

Topographic factor, K_{zt}

For a 2D ridge, $K_1/(H/L_h) = 1.30, \gamma = 3, \mu = 1.5$ (Fig 26.8-1):

$$K_1 = 1.30\frac{H}{L_h} = 1.30 \times \frac{300}{650} = 0.6$$

$$K_2 = 1 - \frac{|x|}{\mu L_h} = 1 - \frac{|750|}{1.5 \times 650} = 0.231$$

$$K_3 = e^{-\gamma z/L_h} = e^{-3\times 40/650}$$

$$K_{zt} = (1 + K_1 K_2 K_3)^2 = \left(1 + 0.6 \times 0.231 \times 0.995^z\right)^2$$

As K_{zt} is a function of height, it must be calculated at each elevation. Refer to the table below.

Ground elevation factor, $K_e = e\text{-}0.0000362 \times 520 = 0.9814$ (Table 26.9-1)

The velocity pressure exposure coefficients (K^z) are calculated per the formulae given in Table 26.10-1:

$$K_z = \begin{cases} 2.01(15/z_g)^{2/a} & \text{for } z < 15 \text{ ft} \\ 2.01(z/z_g)^{2/a} & \text{for } 15 \text{ ft } \leq z \leq zg \end{cases}$$ (Table 26.10.1)

where

a	=	7
z_g	=	1,200 ft

See the table below for the values of K^z *at discrete values of z.*

Velocity pressure, q_z

$$q_z = 0.00256 \times K_z K_{zt} K_d K_e V^2$$ (Cl. 26.10-1)

Mean roof height = height of the building = 40 ft. Refer to table below for calculation of q_z at the mean roof height.

Gust effect factor, G

G is calculated per Cl. 26.11.4 for rigid structures:

$$G = 0.925\left(\frac{1 + 1.7 g_q I_{\bar{z}} Q}{1 + 1.7 g_v I_{\bar{z}}}\right)$$ (Cl. 26.11.4)

where

$g_q = g_v$	=	3.4
$\bar{z}$	=	$max \begin{vmatrix} 30 \ ft \\ 0.6 \times h \end{vmatrix} = 30 \ ft$
ε	=	1/3
ℓ	=	320 ft
c	=	0.3
$L \bar{z}$	=	$\ell(\bar{z} / 33)^{\varepsilon} = 309.99 \ ft$
Q	=	$\sqrt{\frac{1}{1 + 0.63\left(\frac{D + h}{L_{\bar{z}}}\right)^{0.63}}} = \sqrt{\frac{1}{1 + 0.63\left(\frac{25 + 40}{309.99}\right)^{0.63}}} = 0.8997$
$I\bar{z}$	=	$c(33 / \bar{z})^{1/6} = 0.3048$

Therefore, $G = 0.925\left(\frac{1 + 1.7 \times 3.4 \times 0.3048 \times 0.8997}{1 + 1.7 \times 3.4 \times 0.3048}\right) = 0.8658$

Force Coefficient, C_f

C_f is calculated as per Table 29.4-1.

$h/D = 40/25 = 1.6$, so must linearly interpolate between 1 and 7.

$D'/D = 0.5/25 = 0.02$

, so the type of surface is "rough"

The minimum value of $D / \sqrt{q_z}$ corresponds to the maximum value of q_z, which is taken from the tabulated values below (at height, $z = 40 \ ft$).

The minimum value of $D / \sqrt{q_z} = 25 \ ft\sqrt{27.72 \ lb/ft^2} = 4.75 > 2.5$, *so the force coefficient used is for round cross-sections with a relatively wide diameter and rough surface.*

Linearly interpolate between values: $C_f = \frac{(1.6 - 1) \times (0.8 - 0.7)}{(7 - 1)} + 0.7 = 0.71$

The design wind pressure, *p*, is then calculated as:

$$p = q_z \times G \times C_f \qquad \text{(Eq. 29.4-1)}$$

Table 550: Wind intensity versus height for tank structure

h (ft)	K_z	z/L_h	K_3	K_{zt}	q_z (lb/ft^2)	p (lb/ft^2)
0	0.575	0	1	1.296	21.83	13.42
8	0.575	0.012	0.964	1.285	21.64	13.30
16	0.585	0.025	0.929	1.274	21.85	13.43

40	0.761	0.062	0.831	1.243	27.72	17.04

Note: To compare different wind load calculations with STAAD.Pro, the tributary areas below are selected based on the applied wind area defined in the model. These do *not* include any surrounding wind areas outside of the indicated area, which would have wind applied in a typical situation.

The projected distance along the Z axis perpendicular to the wind direction (along the X axis) is

$\sqrt{(3.1287')^2 - (0.4894')^2} = 3.09\ ft$

Load on Nodes 10 and 12

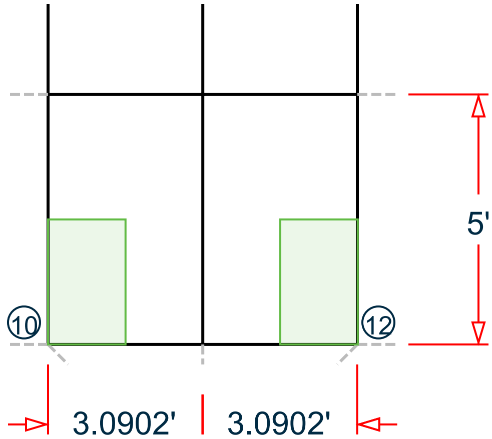

Figure 447: Tributary area for nodes 10 and 12

Wind pressure at half-way between this node and level above (29.5') = 15.78 lb/ft^2.

$$F = (3.09 \text{ ft} / 2) \times (5 \text{ ft} / 2) \times 15.78 \text{ lb/ft}^2 (10)^{-3} = 0.060 \text{ kips}$$

<u>Load on Node 11</u>

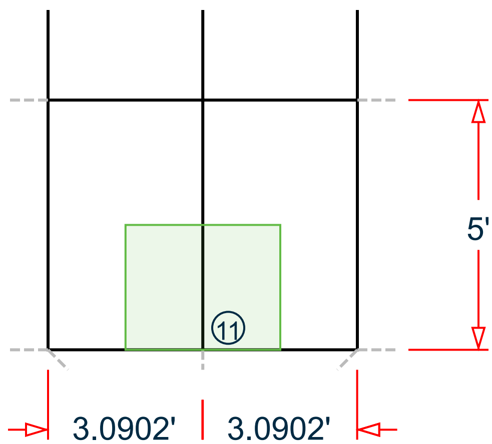

Figure 448: Tributary area for node 11

Wind pressure at half-way between this node and level above (29.5') = 15.78 lb/ft^2.

$$F = (3.09 \text{ ft}) \times (5 \text{ ft} / 2) \times 15.78 \text{ lb/ft}^2 (10)^{-3} = 0.120 \text{ kips}$$

<u>Load on Nodes 102 and 104</u>

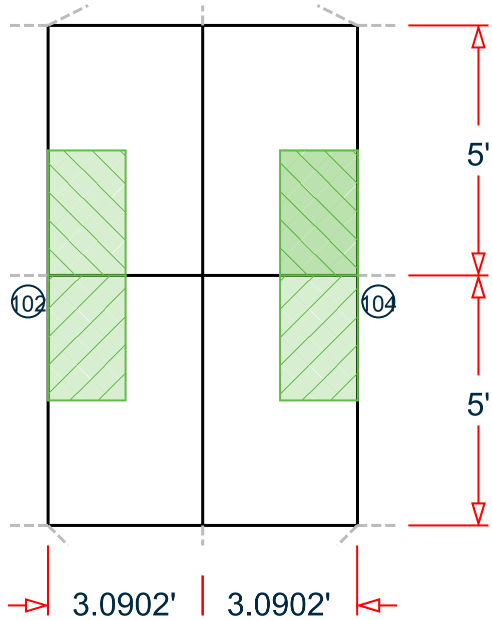

Figure 449: Tributary area for nodes 102 and 104

Wind pressure at half-way between this node and level below (29.5') = 16.11 lb/ft^2.

Wind pressure at half-way between this node and level above (34.5') = 16.42 lb/ft^2.

$$F = (3.09 \text{ ft} / 2) \times (5 \text{ ft} / 2) \times (16.11 \text{ lb/ft}^2 + 16.42 \text{ lb/ft}^2) (10)^{-3} = 0.126 \text{ kips}$$

Load on Node 103

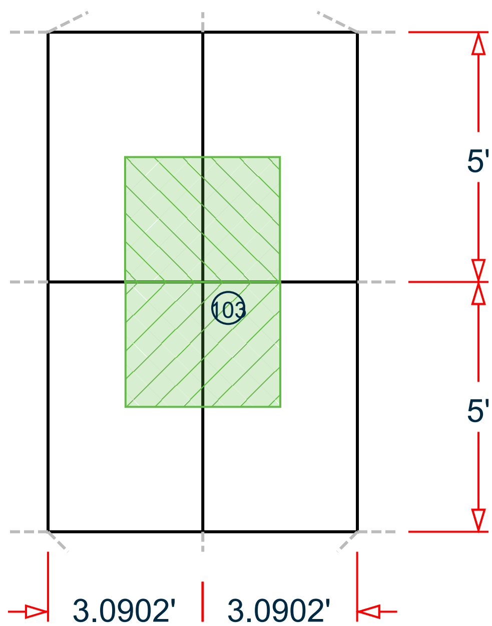

Figure 450: Tributary area for node 103

Wind pressure at half-way between this node and level below (34.5') = 16.11 lb/ft^2.

Wind pressure at half-way between this node and level above (29.5') = 16.42lb/ft^2.

$$F = (3.09 \text{ ft}) \times (5 \text{ ft} / 2) \times (16.11 \text{ lb/ft}^2 + 16.42 \text{ lb/ft}^2)(10)^{-3} = 0.251 \text{ kips}$$

<u>Load on Nodes 30 and 32</u>

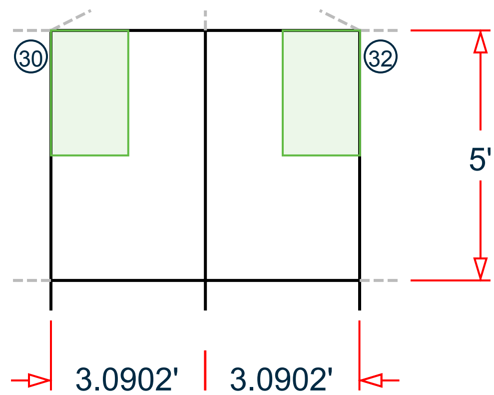

Figure 451: Tributary area for nodes 30 and 32

Wind pressure at top of tributary area (37') = 16.71 lb/ft^2.

$$F = (3.09 \text{ ft} / 2) \times (5 \text{ ft} / 2) \times 16.71 \text{ lb/ft}^2 (10)^{-3} = 0.065 \text{ kips}$$

<u>Load on Node 31</u>

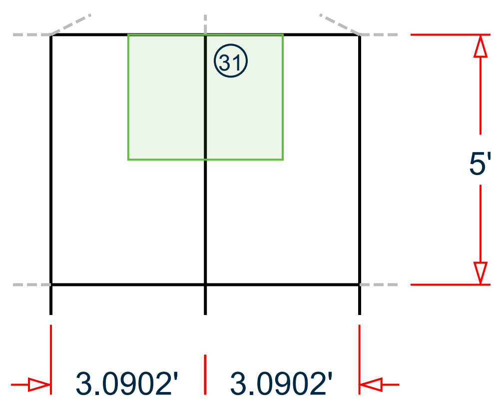

Figure 452: Tributary area for node 31

Wind pressure at top of tributary area (37') = 16.71 lb/ft^2.

$$F = (3.09 \text{ ft}) \times (5 \text{ ft} / 2) \times 16.71 \text{ lb/ft}^2 (10)^{-3} = 0.129 \text{ kips}$$

V. ASCE 7-10 Wind Load Generation

To validate STAAD.Pro calculated equivalent joint loads for a closed structure subjected to Wind Loading. Wind Intensity is calculated as per ASCE 07 – 2010.

Details

When closed type structures are subjected to wind load, panels or closed surfaces are generated by the program based on the members in the ranges specified and their end joints. Wind load, in such way, is converted to equivalent joint loads and applied on the nodes of that closed surface. The area within each closed surface is determined and the share of this area (influence area) for each node in the list is calculated. Wind intensities have been calculated as per ASCE 07 – 2010. The detailed calculation of determination of equivalent joint loads is performed here in this document.

A two-story, single-bay frame is subjected to wind loading from +X direction. Assumptions made while calculating the wind intensities are tabulated in the Validation section of this document.

Verification

Calculation of Wind Intensity

Assumptions made in determination of wind intensities as per ASCE 07 – 2010

- **i.** Analysis Procedure – Directional Procedure for MWFRS of enclosed buildings, Chapter 27
- **ii.** Type of roof – flat
- **iii.** Building Classification Category = Category II (Table 1.5-1)
- **iv.** Basic Wind Speed = 110 mph
- **v.** Exposure Category = Exposure B (Clause 26.7.3)
- **vi.** Wind speed-up over Hills or Escarpment is not considered
- **vii.** Building Height = 20 ft
- **viii.** Building length along the direction of Wind (L) = 10 ft
- **ix.** Building length normal the direction of Wind (B) = 20 ft
- **x.** Natural Frequency of the building = 2 Hz (Hence, as per clause 26.2, this is a rigid building)
- **xi.** Building Damping Ratio = 0.05
- **xii.** Enclosure Classification = Enclosed Building (Clause 26.10)
- **xiii.** Directionality Factor Kd = 0.85 (Table 26.6-1, for MWFRS)
- **xiv.** Topographic Factor, Kzt = 1 (Clause 26.8.2)
- **xv.** Building Wall to generate Wind Load on – Windward side
- **xvi.** Gust Effect Factor, G = 0.85 (Clause 26.9.1)
- **xvii.** External pressure Coefficient Cp = 0.85 (Windward wall pressure coefficient, as per Table 27.4-1)
- **xviii.** Internal pressure coefficient GCpi = -0.18 (For Enclosed Buildings, Table 26.11-1)

Hence, the velocity pressure exposure coefficients (Kz) are calculated as per the formulae given in Table 27.3-1:

From Table 26.9.1, For Exposure B, $\alpha = 7$ and $zg = 1{,}200\ ft$

Height (ft)	Velocity Pressure Exposure Coefficient (Kz)
0 – 15	0.5747196698
16	0.5854155685
17	0.5956440691
18	0.6054513812
19	0.6148768735
20	0.6239543877

As per clause 27.3.2, velocity pressure $q_z = 0.00256x\ K_z \times K_{zt} \times K_d \times V^2\ (lb/ft^2)$

Since Mean roof height h = Height of building = 20 ft

$$q_h = 0.00256\times (K_z)_{h=20\ ft} \times K_{zt} \times K_d \times V^2 = 16.42847\ lb/ft^2$$

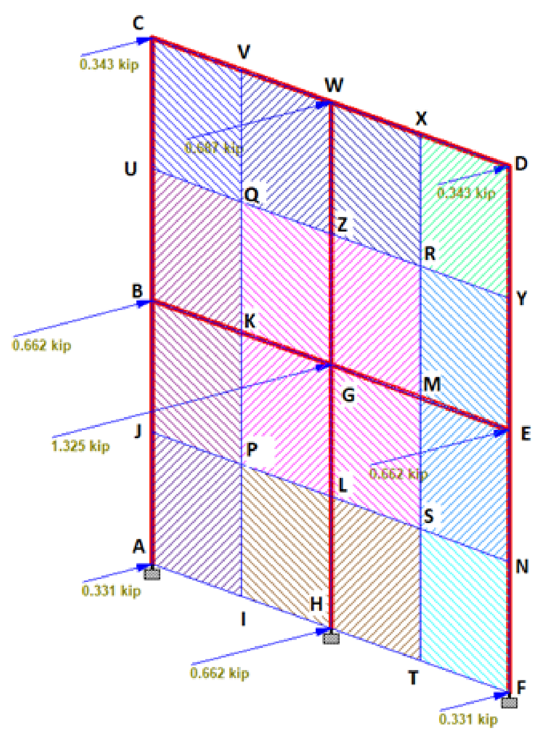
Design wind pressure, p is calculated as per clause 27.4.1 as -

$$p = q \times G \times Cp - q_i \times (GCpi)$$

Values of q_z and p for different heights are calculated using the above formulae and tabulated below.

Height (ft)	Kz	q_z (lb/ft^2)	p (lb/ft2)
15	0.575	15.13	13.25
16	0.585	15.41	13.44
17	0.596	15.68	13.62
18	0.605	15.94	13.80
19	0.615	16.19	13.97
20	0.624	16.43	14.13

Calculation of Equivalent Joint Loads



Evidently, members AB, BG and GH along with the ground surface, forms the closed panel ABGH. P is the CG of the panel, located at 5 ft away from line AH and 5 ft away from line AB. So, influence area for joint A is AJPI. Area of AJPI = 5 × 5 = 25 ft^2.

Average intensity of wind pressure in this area $AJPI = 13.25\ lb/ft^2$

Exposure factor = 1 (for all the nodes in the model)

So, equivalent joint load in joint A = Influence area × Avg. Intensity of wind pressure × Exposure

$$= 25 \times 13.25 \times 1 = 331.2 \text{ lb} = 0.33 \text{ kip}$$

Joint B will be under influence of influence area BKQU and BKPJ. Area of each of those influence areas = 5 × 5 = 25 ft^2. Intensity of wind pressure in each of those influence areas = 13.25 lb/ft^2. Hence, equivalent joint load for each of those areas = 0.33 kip

So, total joint load in joint B = 0.331 × 2 = 0.662 kip

Joint C will be under influence area CVQU. Average intensity of wind pressure in this influence area will be

$$= (13.25 + 14.1284837) / 2 = 13.69 \text{ lb/ft}^2$$

Exposure Factor = 1

Area of CVQU = $5 \times 5 = 25\ ft^2$

Hence, equivalent joint load at joint $C = 342.2\ lb \approx 0.343\ kip$

Joint W will be under influence of area WXRZ and WVQZ. Area of both of these = 25 ft^2. Average intensity of wind pressure in both of the influence areas = Average intensity of wind in the influence area CVQU = 13.68 lb/ft^2. Hence, equivalent joint load on joint $W = 2 \times 0.343\ kip = 0.686\ kip$

Joint G will be under the influence of area GZRM, GZQK, GMSL and GKPL. Area of each of these influence areas = 5 × 5 = 25 ft^2. Average intensity of wind pressure in each of these areas = average intensity of wind pressure in area BKQU = 13.25 lb/ft^2. Hence, equivalent joint load on joint $G = 4 \times 0.33 = 1.32\ kip$

Joint H will be under the influence of areas HLPI and HTSL. Area of each of those influence areas = 5 × 5 = 25 ft^2. Intensity of wind pressure in each of those influence areas = 13.25 lb/ft^2. Hence, equivalent joint load on joint H $= 2 \times 0.33 = 0.66\ kip$

Since the structure is symmetric about the line WH, the equivalent joint load at D = equivalent joint load at C = 0.34 kip, equivalent joint load at B = equivalent joint load at E = 0.66 kip and equivalent joint load at A = equivalent joint load at F = 0.33 kip.

V. ASCE 7-02 Wind Load Generation on Building

Verify the windward loads due to wind on a portion of a building structure calculated per the ASCE 7-02 specification.

Details

The wind load is calculated for a rigid building structure using the procedure for MWFRS of enclosed buildings (ASCE 7-02, Section 6.5.12.2.1). The following assumptions and parameters apply:

Flat roof type
Category II building (Table 1-1)
Basic wind speed = 108 mph
Structure type of “building”
Exposure Category B
Do not consider wind speed-up over hills or escarpments
Building height = 40 ft
Building length along the wind direction, L = 10 ft
Building width normal to wind direction, B = 20 ft
Natural frequency of structure = 2 Hz (i.e., a “rigid” building per Section 6.2)
Damping ratio = 0.05
Enclosed building (per Section 6.2)

Calculate the resulting joint loads on the *windward* side due to wind along the X axis at the upper wall of one segment of the building.

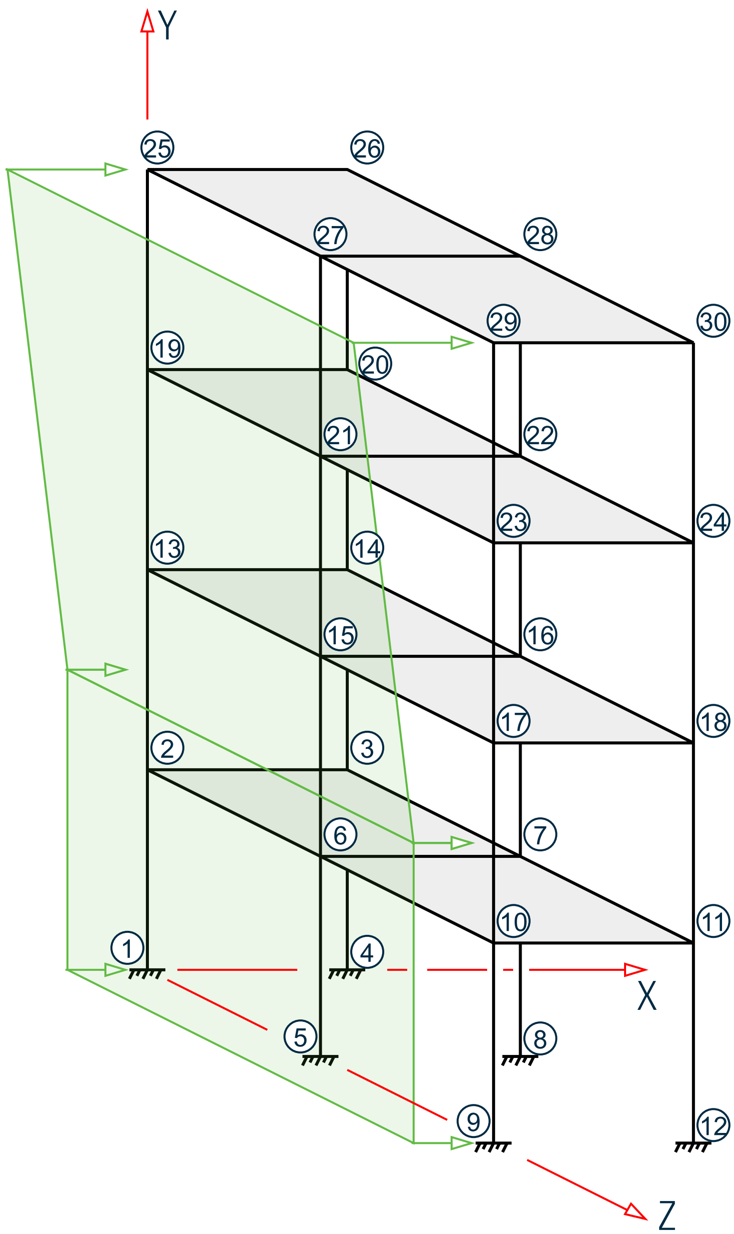

Figure 453: Building structure with wind load in X direction

Validation

Importance factor, $I = 1.0$ (Table 6-1)

The velocity pressure exposure coefficients (K^z) are calculated per the formulae given in Table 6-3:

$$K_z = \begin{vmatrix} 2.01(15/z_g)^{2/a} & \text{for } z < 15 \text{ ft} \\ 2.01(z/z_g)^{2/a} & \text{for } 15 \text{ ft } \le z \le zg \end{vmatrix} \qquad \text{(Table 6-3)}$$

where

a = 7 (Table 6-2)

z_g = 1,200 ft (Table 6-2)

See the table below for the values of K^z *at discrete values of z.*

Directionality factor, $K_d = 0.85$ (Table 6-4)

Topographic factor, $K_{zt} = 1.0$ (i.e., not considered)

Velocity pressure, q_z

$$q_z = 0.00256 K_z K_{zt} K_d V^2 I \quad \text{(Eq. 6-15)}$$

Mean roof height = height of the building = 30 ft. Refer to table below for calculation of q_z at the mean roof height.

Gust effect factor, G

G is calculated per Cl. 26.11.4 for rigid structures:

$$G = 0.925\left(\frac{1 + 1.7 g_q I_{\bar{z}} Q}{1 + 1.7 g_v I_{\bar{z}}}\right) \quad \text{(Eq. 6-4)}$$

where

$g_q = g_v$ = 3.4

$\bar{z}$ = $max \left| \begin{matrix} 30\ ft \\ 0.6 \times h \end{matrix} \right. = 30\ ft$

ε = 1/3

ℓ = 320 ft

c = 0.3

$L_{\bar{z}}$ = $\ell\left(\bar{z} / 33\right)^{\varepsilon} = 309.99\ ft$

Q = $\sqrt{\frac{1}{1 + 0.63\left(\frac{B + h}{L_{\bar{z}}}\right)^{0.63}}} = \sqrt{\frac{1}{1 + 0.63\left(\frac{20 + 40}{309.99}\right)^{0.63}}} = 0.904$

$I_{\bar{z}}$ = $c\left(33 / \bar{z}\right)^{1/6} = 0.305$

Therefore, $G = 0.925\left(\frac{1 + 1.7 \times 3.4 \times 0.305 \times 0.904}{1 + 1.7 \times 3.4 \times 0.305}\right) = 0.8683$

External pressure coefficient, $C_p = 0.8$ for windward per Fig. 6-6.

The external design pressure, $p = q_h G C_p$.

The internal pressure coefficient, $GC_{pi} = -0.18$ for partially enclosed buildings per Figure 6-5.

The internal design pressure, $p_i = q_i(GC_{pi}) = 19.30 \times -0.18 = -3.47\ lb/ft^2$

where

q_i = the velocity pressure evaluated at the building height, h,

$q_h = 0.00256 K_{z=h} K_{zt} K_d V^2 I = 0.00256\left(0.761\right)\left(1.0\right)\left(0.85\right)(108)^2\left(1.0\right) = 19.30\ lb/f$

The design wind pressure, p, is then calculated as:

$$p = q_z G C_p - q_i(GC_{pi}) \quad \text{(Eq. 6-17)}$$

Table 553: Wind intensity versus height for building structure

h (ft)	K_z	q_z (lb/ft^2)	p (lb/ft^2)
0	0.575	14.59	13.61
15	0.575	14.59	13.61
20	0.624	15.84	14.48
25	0.665	16.88	15.20
30	0.701	17.78	15.83
35	0.732	18.58	16.38
40	0.761	19.30	16.89

Load on Nodes 1 and 9

Assume that the ground (Y = 0') acts as a bounded edge for the wind load acting on the exterior of the building. This edge transfers load to the columns.

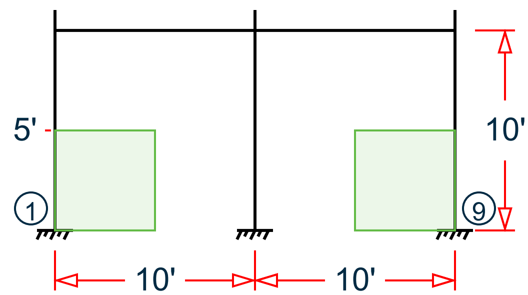

Figure 454: Tributary area for nodes 1 and 9

Wind pressure at half-way between this node and level above (5') = 13.61 lb/ft^2.

$$F = (10\ ft / 2) \times (10\ ft / 2) \times 13.61\ lb/ft^2\ (10)^{-3} = 0.34\ kips$$

Load on Node 5

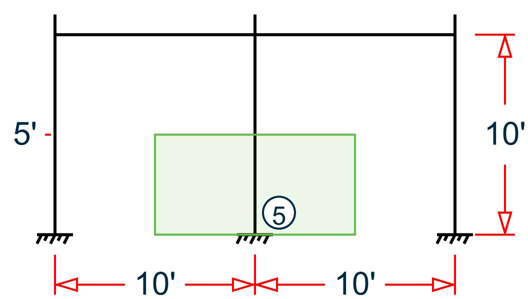

Figure 455: Tributary area for node 5

Wind pressure at half-way between this node and level above (5') = 13.61 lb/ft^2.

$$F = (10 \text{ ft} / 2) \times (10 \text{ ft}) \times 13.60 \text{ lb/ft}^2 (10)^{-3} = 0.68 \text{ kips}$$

Load on Nodes 2 and 10

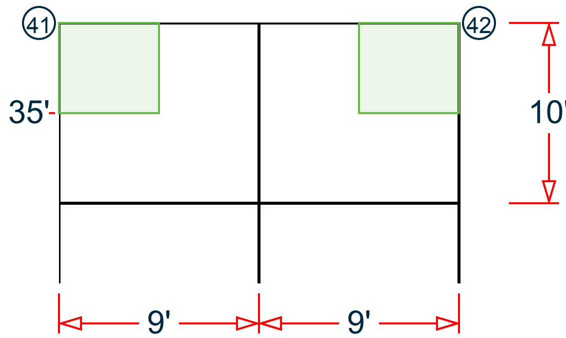

Figure 456: Tributary area for nodes 2 and 10

Wind pressure at half-way between this node and level above (5') = 13.61 lb/ft^2. This pressure is constant below this height.

$$F = (10 \text{ ft} / 2) \times (10 \text{ ft}) \times 13.61 \text{ lb/ft}^2 (10)^{-3} = 0.68 \text{ kips}$$

Load on Node 6

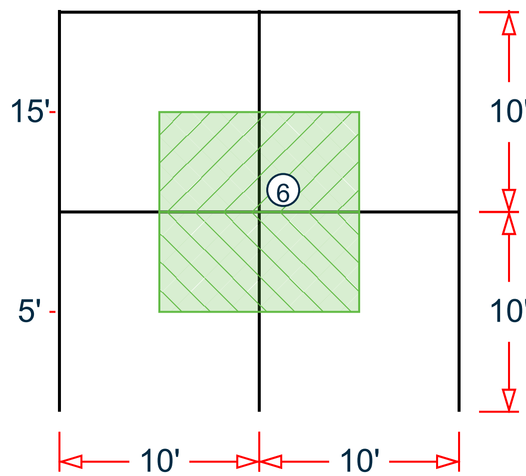

Figure 457: Tributary area for node 6

Wind pressure at half-way between this node and level above (5') = 13.61 lb/ft^2. This pressure is constant below this height.

$$F = (10 \text{ ft}) \times (10 \text{ ft}) \times 13.61 \text{ lb/ft}^2 (10)^{-3} = 1.36 \text{ kips}$$

Load on Nodes 13 and 17

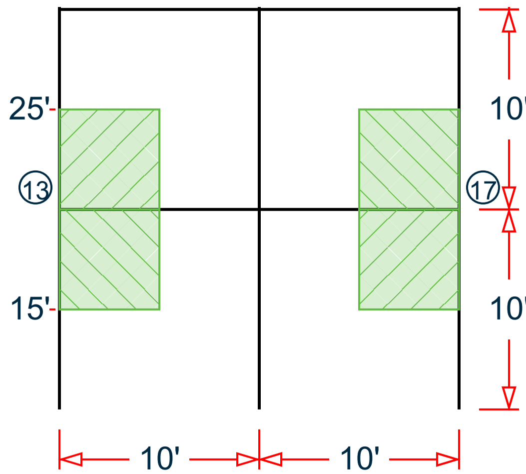

Figure 458: Tributary area for nodes 13 and 17

Wind pressure at half-way between this node and level below (15') = 13.61 lb/ft^2.

Wind pressure at half-way between this node and level above (25') = 15.20 lb/ft^2.

$$F = (10 \text{ ft} /2) \times (10 \text{ ft} / 2) \times (13.61 \text{ lb/ft}^2 + 15.20 \text{ lb/ft}^2) (10)^{-3} = 0.72 \text{ kips}$$

<u>Load on Node 15</u>

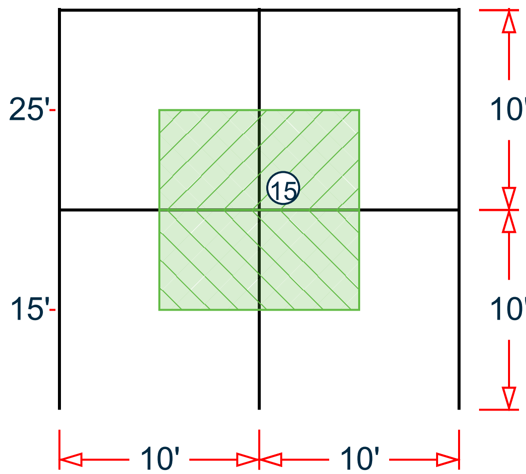

Figure 459: Tributary area for node 15

Wind pressure at half-way between this node and level below (15') = 13.61 lb/ft^2.

Wind pressure at half-way between this node and level above (25') = 15.20 lb/ft^2.

$$F = (10 \text{ ft} /2) \times (10 \text{ ft}) \times (13.61 \text{ lb/ft}^2 + 15.20 \text{ lb/ft}^2) (10)^{-3} = 1.44 \text{ kips}$$

<u>Load on Node 19</u>

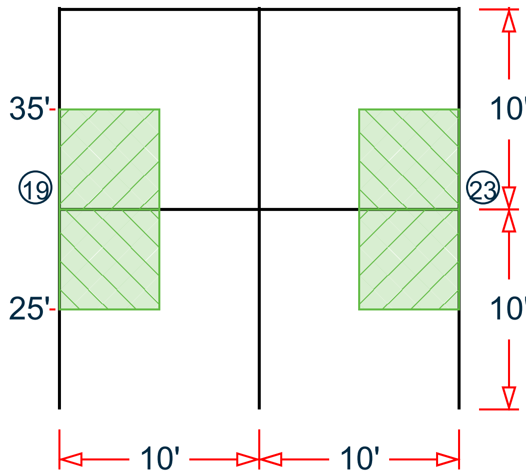

Figure 460: Tributary area for nodes 19 and 23

Wind pressure at half-way between this node and level below (25') = 15.20 lb/ft^2.

Wind pressure at half-way between this node and level above (35') = 16.38 lb/ft^2.

$$F = (10 \text{ ft} /2) \times (10 \text{ ft} / 2) \times (15.20 \text{ lb/ft}^2 + 16.38 \text{ lb/ft}^2) (10)^{-3} = 0.79 \text{ kips}$$

Load on Node 21

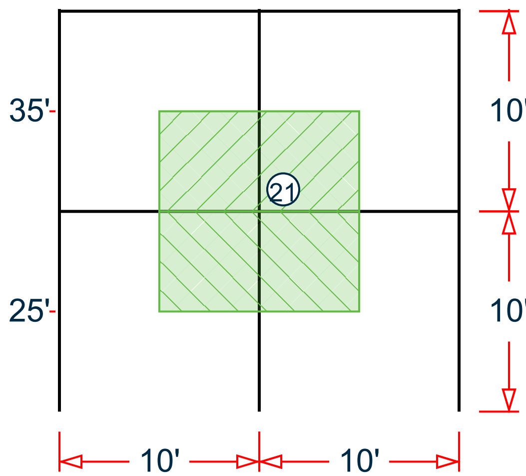

Figure 461: Tributary area for node 21

Wind pressure at half-way between this node and level below (25') = 15.20 lb/ft^2.

Wind pressure at half-way between this node and level above (35') = 16.38 lb/ft^2.

$$F = (10 \text{ ft}) \times (10 \text{ ft} / 2) \times (15.20 \text{ lb/ft}^2 + 16.38 \text{ lb/ft}^2) (10)^{-3} = 1.58 \text{ kips}$$

Load on Nodes 25 and 29

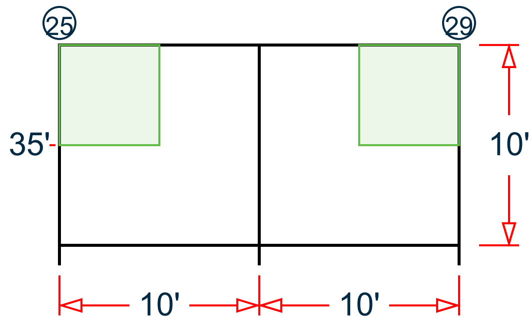

Figure 462: Tributary area for nodes 25 and 29

Wind pressure at roof level (40') = 16.89 lb/ft^2.

$$F = (10\text{ ft} / 2) \times (10\text{ ft} / 2) \times 16.89\text{ lb/ft}^2\ (10)^{-3} = 0.42\text{ kips}$$

Load on Node 27

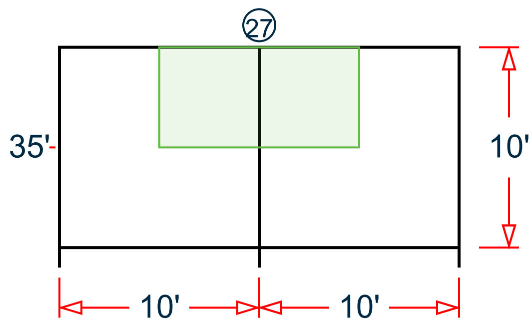

Figure 463: Tributary area for node 27

Wind pressure at roof level (40') = 16.89 lb/ft^2.

$$F = (10\text{ ft}) \times (10\text{ ft} / 2) \times 15.04\text{ lb/ft}^2\ (10)^{-3} = 0.84\text{ kips}$$

V. GB 50009-2012 Wind Load generation on Rectangular Building

Verify the calculated wind pressure at the mid-height (4.5 m) on a structure per the Chinese GB 50009-2012 code.

Problem

This problem determines the pressures applied to a rectangular building at various significant heights, from a wind force that is flowing in the positive X direction (i.e. from X= -infinity to X= + infinity).

Note: STAAD.Pro generates loading on the windward face, sidewalls, and also leeward face of the buildings.

A 9 m tall, two story structure is subject to a wind load along the along the global X direction. The building width (along the Z direction, perpendicular to wind) is 6 m. The building length (along the X direction, parallel to wind) is 10 m. The structure is a closed structure. The building is located in Beijing City in the Beijing province.

> The shape factor, $\mu_s = 0.8$. This is for the left face of the structure and the direction of wind is from left (+X). (+X) means that the wind is originating along the X axis pointing in the +X direction. The plan section type of the structure is rectangle. Refer to table 8.3.1 of the Chinese load code GB 50009-2012.
> The reference wind pressure, $w_0 = 0.45\ kN/m^2$. Refer to table E.5 in the Chinese load code GB 50009-2012.
> The roughness type is “C”

Wind-induced vibration along-wind is not considered ($\beta_z = 1$).

Calculations

Calculate the modified wind shape factor:

$$\mu_s' = \mu_s \times \beta_z = 0.8 \times 1.0 = 0.8$$

Calculate the modified wind height factor:

Per Table 8.2.1 of GB 50009-2012, at a height of z = 4.5 m for a roughness type of “A”, $\mu_z = 1.09$

$$\mu_z' = \mu_z \times \beta_z = 1.09 \times 1.0 = 1.09$$

There is no modification for the reference wind pressure, so $w_0 = 0.45\ kN/m^2$

The origin value of reference wind pressure is taken from table E.5 in the Chinese load code GB 50009-2012, $w_{o,origin}\ b= 0.45$

Calculate the wind pressure characteristic value, w_k (wind intensity at height, z = 4.5 m):

$$w_k = \beta_z \mu_z w_0 = 1 \times 1.09 \times 0.45 = 0.491 \text{ kN/m}^2$$

The height factor for z = 9 is determined by linear interpolation between z = 5 ($\mu_z = 1.09$) and z = 10 ($\mu_z = 1.28$): $\mu_z = 1.24$.

Calculate the wind pressure characteristic value, w_k (wind intensity at height, z = 9 m):

$$w_k = \beta_z \mu_z w_0 = 1 \times 1.24 \times 0.45 = 0.558 \text{ kN/m}^2$$

Comparison

Result Type	Reference	STAAD.Pro	Difference	Comment
Wind pressure characteristic value, w_k at z = 4.5 m (kN/m^2)	0.491	0.490	negligible	
Wind pressure characteristic value, w_k at z = 9 m (kN/m^2)	0.558	0.559	negligible	

These values are compared with the generated intensity values that the STAAD.Pro Analytical workflow adds into the STAAD input file.

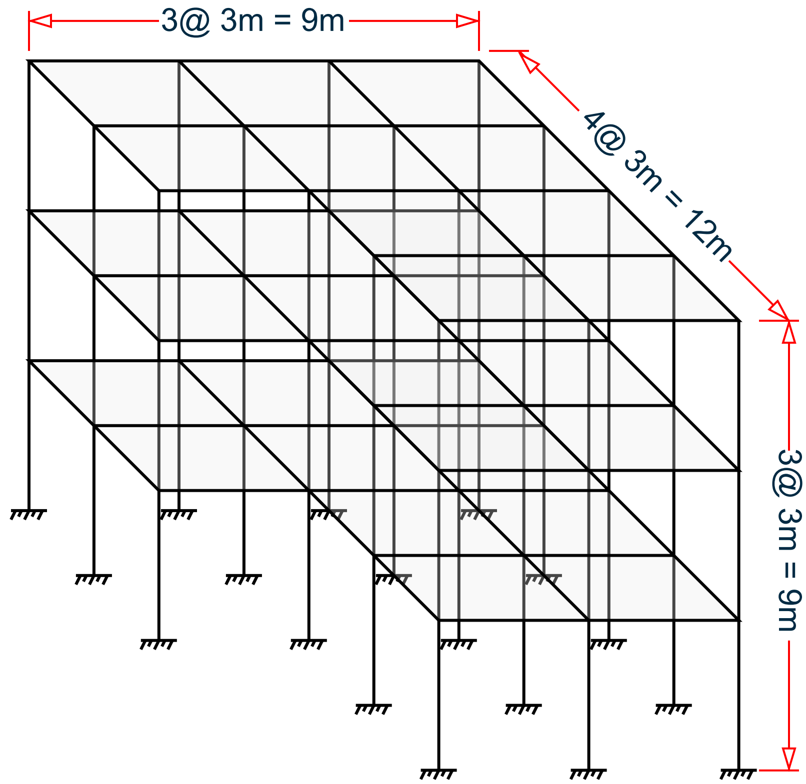
V. IS 875 (Pt 3) 2015 WL Generation on Rectangular Clad Bldg 1

Determine the lateral wind loads on a three-story clad building per the IS 875 (Part 3): 2015 code.

Details



- Building length along wind when wind blow +X or -X direction, L_x = 9 m
- Building length across wind when wind blow +X or -X direction, L_z = 12 m
- Building length along wind when wind blow +Z or -Z direction, L_z = 12 m
- Building length across wind when wind blow +Z or -Z direction, L_x = 9 m
- Building Height, $h = 9\ m$
- Basic Wind Speed, $V_b = 47\ m/s$ (Location Agra as per ANNEX A of IS 875 3:2015)
- Terrain Category: Terrain Category 1 (Cl 6.3.2.1 as per IS 875 3:2015)
- Risk Coefficient Factors, $k_1 = 1.0$ (All general buildings from Table 1 of IS 875 3:2015)
- Topography Factor, $k_3 = 1.0$ (Up wind slope (Θ) below 3 degree from Cl 6.3.3.1 of IS 875 3:2015)
- Importance Factor for Cyclonic Region, $k_4 = 1.0$ (All other Structures from Cl 6.3.4 of IS 875 3:2015)
- Wind Directionality Factor for Buildings, $K_d = 0.9$ (From Cl 7.2.1 of IS 875 3:2015)
- Area Averaging Factor, $K_a = 0.9$ (From Table 4 of IS 875 3:2015)
- Combination Factor, $K_c = 0.9$ (From Cl 7.3.3.13 of IS 875 3:2015)

Validation

Calculate the design wind speed and pressure:

There is no variation in either for the first 10 m in height, thus the values are constant for the height of the building.

- Terrain & height factor, k_2 (from Table 2 of IS 875 (Part 3): 2015) = 1.05

The design wind speed:

$$V_z = V_b \times k_1 \times k_2 \times k_3 \times k_4 = 47\ (1.0)\ (1.05)\ (1.0)\ (1.0) = 49.35 \qquad \text{(Cl 6.3)}$$

Wind pressure at height, z = 10 m:

$$P_z = 0.6 \times V_z^2 = 0.6\ (49.35)^2 = 1.461\ \text{kN/m}^2 \qquad \text{(Cl. 7.2)}$$

Design wind pressure:

$$P_d = K_d \times K_a \times K_c \times P_z = (0.9)\ (0.9)\ (0.9)\ (1.461) = 1.065\ \text{kN/m}^2 \qquad \text{(Cl 7.2)}$$

Check the minimum wind pressure: $0.7 \times P_z = 1.023 < P_d$, OK.

Internal pressure coefficient:

- $C_{pi} = 0.2$ (Positive internal Coefficient as the building opening not more than 5 % From Cl 7. 3.2.1 of IS 875 3:2015)
- $C_{pi} = -0.2$ (Negative internal Coefficient as the building opening not more than 5 % From Cl 7. 3.2.1 of IS 875 3:2015)

External Pressure Coefficient when wind Positive (+X) Direction (From Table 5 of IS 875 3:2015):

- External Pressure Coefficient wind along +X on face A, $C_{pe} = 0.7$
- External Pressure Coefficient wind along +X on face B, $C_{pe} = -0.25$
- External Pressure Coefficient wind along +X on face C, $C_{pe} = -0.6$
- External Pressure Coefficient wind along +X on face D, $C_{pe} = -0.6$

Calculate the equivalent joint loads:

equiv joint load = influence area × avg. intensity of wind pressure × net pressure coefficient

<u>Face A (From +X Direction)</u>

The positive wind load is acting towards face A as per clause 7.3.1 of IS 875 (Part 3) : 2015 and the equivalent joint loads are calculated as follows

- At joint 1 (joints 13 , 33 , 34 , 45 , 46 , 66 , 78 similar)
  - For Positive Cpi , Equivalent joint load = 2.25 m^2 × 1.065 kN/m^2 × [0.7 – (+0.2)] = 1.198 kN
  - For Negative Cpi , Equivalent joint load= 2.25 m^2 × 1.065 kN/m^2 × [0.7 – (-0.2)] = 2.157 kN
- At joint 5 (joints 9 , 17 , 29 , 37 , 38 , 41 , 42 , 50 , 62 , 70 , 74 similar)
  - For Positive Cpi , Equivalent joint load = 4.5 m^2 × 1.065 kN/m^2 × [0.7 – (+0.2)] = 2.397 kN
  - For Negative Cpi , Equivalent joint load = 4.5 m^2 × 1.065 kN/m^2 × [0.7 – (-0.2)] = 4.314 kN
- At joint 21 (joints 25 , 54 , 58 similar)
  - For Positive Cpi , Equivalent joint load = 9 m^2 × 1.065 kN/m^2 × [0.7 – (+0.2)] = 4.79 kN
  - For Negative Cpi , Equivalent joint load = 9 m^2 × 1.065 kN/m^2 × [0.7 – (-0.2)] = 8.62 kN

<u>Face B (From +X Direction)</u>

The negative wind load is acting away from face B as per clause 7.3.1 of IS 875 (Part 3) : 2015 and the equivalent joint loads are calculated as follows

- At joint 4 (joints 16 , 68 , 80 similar)
  - For Positive Cpi , Equivalent joint load = 2.25 m^2 × 1.065 kN/m^2 × [(-0.25) – (+0.2)] = -1.079 kN
  - For Negative Cpi , Equivalent joint load = 2.25 m^2 × 1.065 kN/m^2 × [(-0.25) – (-0.2)] = -0.12 kN

- At joint 8 (joints 12 , 20 , 32 , 36 , 48 , 52 , 64 , 72 , 76 similar)
  - For Positive Cpi , Equivalent joint load = 4.5 m^2 × 1.065 kN/m^2 × [(-0.25) – (+0.2)] = -2.157 kN
  - For Negative Cpi , Equivalent joint load = 4.5 m^2 × 1.065 kN/m^2 × [(-0.25) – (-0.2)] = -0.24 kN
- At joint 24 (joints 28 , 40 , 44 , 56 , 60 similar)
  - For Positive Cpi , Equivalent joint load = 9 m^2 × 1.065 kN/m^2 × [(-0.25) – (+0.2)] = -4.314 kN
  - For Negative Cpi , Equivalent joint load = 9 m^2 × 1.065 kN/m^2 × [(-0.25) – (-0.2)] = -0.479 kN

Face C (Wind From +X Direction)

The negative wind load is acting away from face C as per clause 7.3.1 of IS 875 (Part 3) : 2015 and the equivalent joint loads are calculated as follows

- At joint 1 (joints 4 , 13 , 16 similar)
  - For Positive Cpi , Equivalent joint load = 2.25 m^2 × 1.065 kN/m^2 × [(-0.6) – (+0.2)] = -1.917 kN
  - For Negative Cpi , Equivalent joint load = 2.25 m^2 × 1.065 kN/m^2 × [(-0.6) – (-0.2)] = -0.959 kN
- At joint 2 (joints 3 , 5 , 8 , 9 , 12 , 14 , 15 similar)
  - For Positive Cpi , Equivalent joint load = 4.5 m^2 × 1.065 kN/m^2 × [(-0.6) – (+0.2)] = -3.835 kN
  - For Negative Cpi , Equivalent joint load = 4.5 m^2 × 1.065 kN/m^2 × [(-0.6) – (-0.2)] = -1.917 kN
- At joint 6 (joints 7 , 10 , 11 similar)
  - For Positive Cpi , Equivalent joint load = 9 m^2 × 1.065 kN/m^2 × [(-0.6) – (+0.2)] = -7.668 kN
  - For Negative Cpi , Equivalent joint load = 9 m^2 × 1.065 kN/m^2 × [(-0.6) – (-0.2)] = -3.834 kN

Face D (From +X Direction)

The negative wind load is acting away from face D as per clause 7.3.1 of IS 875 (Part 3) : 2015 and the equivalent joint loads are calculated as follows

- At joint 33 (joints 34 , 45 , 46 , 66 , 68 , 78 , 80 similar)
  - For Positive Cpi , Equivalent joint load = 2.25 m^2 × 1.065 kN/m^2 × [(-0.6) – (+0.2)] = -1.917 kN
  - For Negative Cpi , Equivalent joint load = 2.25 m^2 × 1.065 kN/m^2 × [(-0.6) – (-0.2)] = -0.959 kN
- At joint 37 (joints 38 , 41 , 42 , 67 , 70 , 72 , 74 , 76 , 79 similar)
  - For Positive Cpi , Equivalent joint load = 4.5 m^2 × 1.065 kN/m^2 × [(-0.6) – (+0.2)] = -3.835 kN
  - For Negative Cpi , Equivalent joint load = 4.5 m^2 × 1.065 kN/m^2 × [(-0.6) – (-0.2)] = -1.917 kN
- At joint 71 (joint 75 similar)
  - For Positive Cpi , Equivalent joint load = 9 m^2 × 1.065 kN/m^2 × [(-0.6) – (+0.2)] = -7.668 kN
  - For Negative Cpi , Equivalent joint load = 9 m^2 × 1.065 kN/m^2 × [(-0.6) – (-0.2)] = -3.834 kN

Results

Table 555: Representative joint loads due to wind in +X direction for positive internal presssure (+Cpi) (kN)

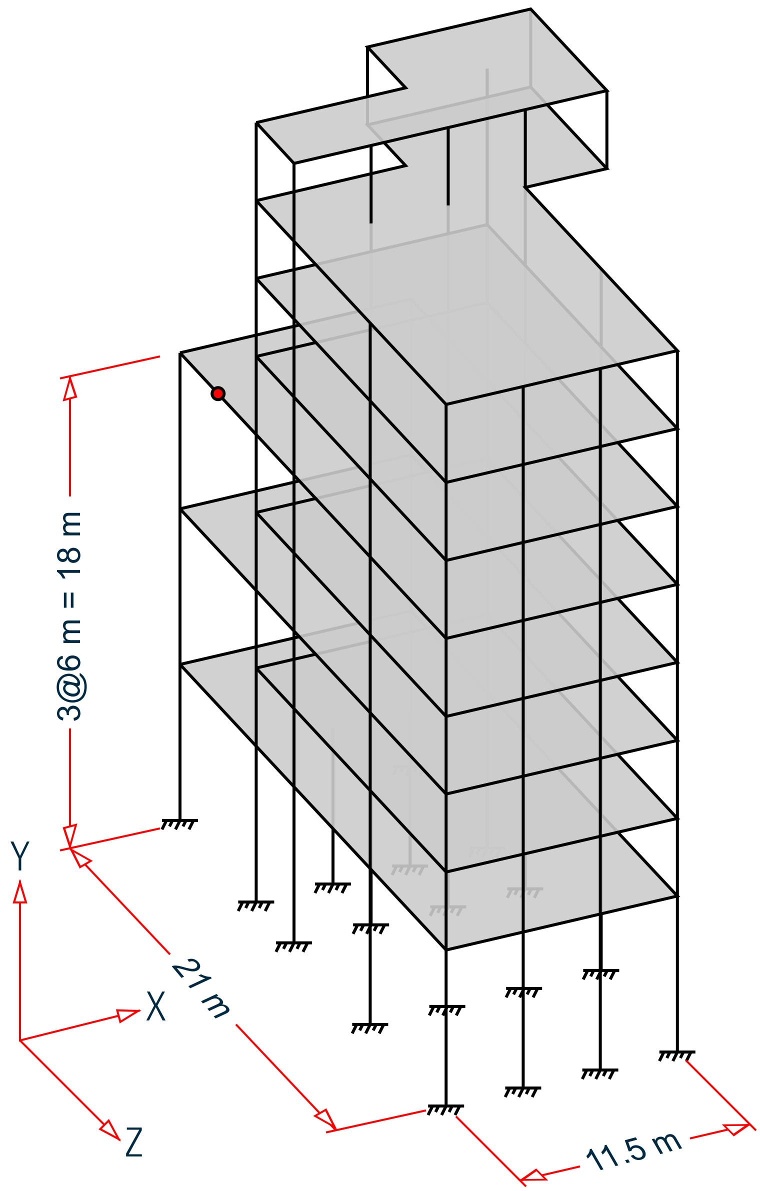
V. IS 875 (Pt 3) 2015 WL Generation on Rectangular Clad Bldg 2

Verify the calculated wind pressure on an edge node on a clad building per the IS 875 (Part 3): 2015 code.

Details

The following structure:

Not all members are displayed here for clarity.



- Building length along wind when wind blow +X or -X direction, $L_x = 11.5\ m$
- Building length across wind when wind blow +X or -X direction, $L_z = 21\ m$
- Building length along wind when wind blow +Z or -Z direction, $L_z = 21\ m$
- Building length across wind when wind blow +Z or -Z direction, $L_x = 11.5\ m$
- Building Height, $h = 30\ m$
- Basic Wind Speed, $V_b = 33\ m/s$ (Location: Bengaluru; as per Annex A of IS 875 3:2015)
- Terrain Category: Terrain Category 2 (Cl 6.3.2.1 as per IS 875 3:2015)
- Risk Coefficient Factors, $k_1 = 1.05$ (All general buildings from Table 1 of IS 875 3:2015)

- Topography Factor, k_3 = *1.15* (Up wind slope (Θ) below 3 degree from Cl 6.3.3.1 of IS 875 3:2015)
- Importance Factor for Cyclonic Region, k_4 = *1.0* (All other Structures from Cl 6.3.4 of IS 875 3:2015)
- Wind Directionality Factor for Buildings, K_d = *1* (From Cl 7.2.1 of IS 875 3:2015)
- Area Averaging Factor, K_a = *0.95* (From Table 4 of IS 875 3:2015)
- Combination Factor, K_c = *0.9* (From Cl 7.3.3.13 of IS 875 3:2015)

Validation

Table 557: Calculation of Variation in Design Wind Speed & Pressure with Height

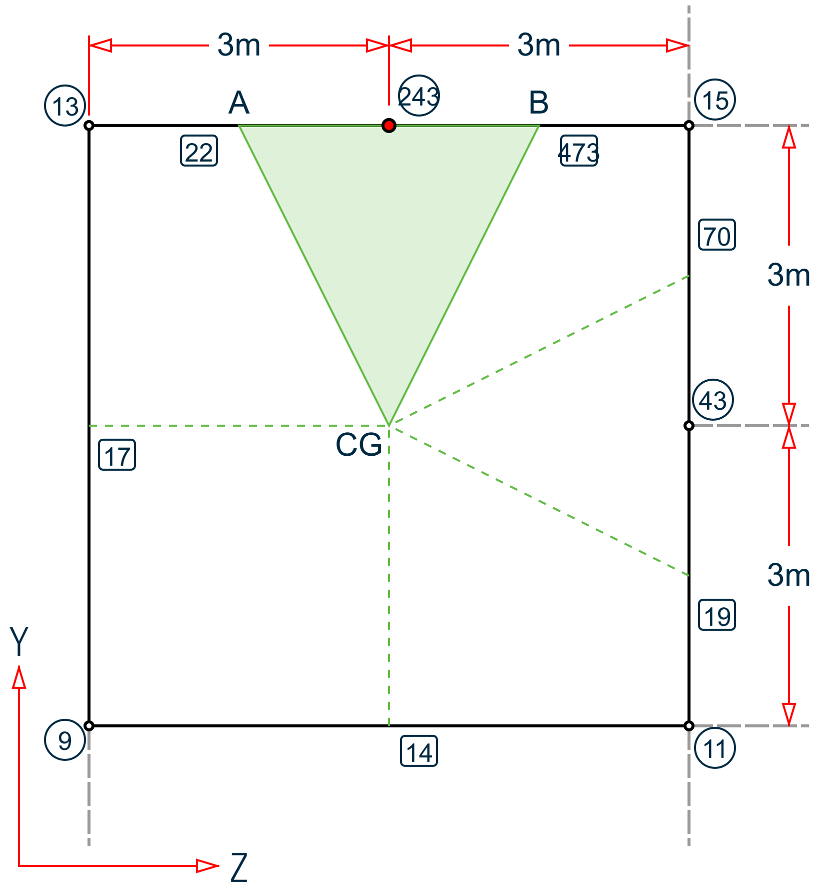
Height from Ground, m	Terrain & Height Factor, k_2 (from TABLE 2 of IS 875 Part 3:2015)	Design Wind Speed, $V_z = V_b \times k_1 \times k_2 \times k_3 \times k_4$ m/s (from Cl 6.3 of IS 875 Part 3:2015)	Wind Pressure at height z, $P_z = 0.6 \times V_z^2$ N/m² (from Cl 7.2 of IS 875 Part 3:2015)	Design Wind Pressure, $P_d = K_d \times K_a \times K_c \times P_z$ kN/m² (from Cl 7.2 of IS 875 Part 3:2015)	The Value of $0.7 \times P_z$ kN/m² (from Cl 7.2 of IS 875 Part 3:2015)	Status of the Value of $P_d \geq 0.7 \times P_z$ kN/m² (from Cl 7.2 of IS 875 Part 3:2015)
≤ 10	1	39.85	952.7	0.815	0.667	OK
12	1.02	40.64	991.2	0.847	0.694	OK
15	1.05	41.84	1050.3	0.898	0.735	OK
18	1.062	42.32	1074.5	0.919	0.752	OK
21	1.075	42.84	1101.0	0.941	0.771	OK
24	1.09	43.43	1131.9	0.968	0.792	OK
27	1.105	44.03	1163.3	0.995	0.814	OK
30	1.12	44.63	1195.1	1.022	0.837	OK

Internal Pressure Coefficient per Cl 7. 3.2.2 of IS 875 3:2015 for buildings with openings between 5 and 20%:

- C_{pi} = *0.5* (positive internal coefficient)
- C_{pi} = *-0.5* (negative internal coefficient)

Node 243 is at an elevation of 18 m, thus the average intensity of wind pressure in this area, $P_{d,\ z=18} = 0.919\ kN/m^2$.

<u>Tributary Area of Node 243</u>



For a given panel, draw straight lines from the center of gravity (CG) to the midpoint of the members. So, the panel region will now contain several quadrilaterals whose two sides are made of portions of the respective members (or the ground) and the other two sides are lines going from the CG to the midpoint of the corresponding members.

Points A and B are the midpoints of members 473 and 22, respectively. Points A and B for a closed panel with the CG. Further, point 243 is located along segment A-B, so in this case the quadrilateral reduced to a triangle. So, the influence area for joint 243 is A-243-B-CG, which has an area of:

$$A_{243} = (3 \times 3) / 2 = 4.5 \text{ m}^2$$

<u>Positive X Direction</u>

The positive wind load is acting towards face A as per clause 7.3.1 of IS 875 (Part 3) : 2015 and the equivalent joint loads are calculated as follows:

External pressure coefficient for wind in the +X direction (from Table 5 of IS 875 3:2015):

$$3/2 < h/w = 30 / 11.5 = 2.6 < 6$$

$$3/2 < l /w = 21 / 11.5 = 1.8 < 4$$

- External Pressure Coefficient wind along +X on face A, $C_{pe} = 0.7$
- External Pressure Coefficient wind along +X on face B, $C_{pe} = -0.4$
- External Pressure Coefficient wind along +X on face C, $C_{pe} = -0.7$

- External Pressure Coefficient wind along +X on face D, C_{pe} = *-0.7*

The equivalent joint loads are:

- For Positive Cpi , equivalent joint load = $4.5\ m^2 \times 0.919\ kN/m^2 \times [0.7 – (+0.5)] = 0.83\ kN$
- For Negative Cpi , equivalent joint load = $4.5\ m^2 \times 0.919\ kN/m^2 \times [0.7 – (-0.5)] = 4.96\ kN$

Negative X Direction

- For Positive Cpi , equivalent joint load = $4.5\ m^2 \times 0.919\ kN/m^2 \times [-0.4 – (+0.5)] = 3.72\ kN$
- For Negative Cpi , equivalent joint load = $4.5\ m^2 \times 0.919\ kN/m^2 \times [-0.4 – (-0.5)] = 0.41\ kN$

Positive Z Direction

- For Positive Cpi , equivalent joint load = $4.5\ m^2 \times 0.919\ kN/m^2 \times [-0.5 - (+0.5)] = 4.13\ kN$
- For Negative Cpi , equivalent joint load = $4.5\ m^2 \times 0.919\ kN/m^2 \times [-0.5 - (-0.5)] = 0\ kN$

Negative Z Direction

- For Positive Cpi , equivalent joint load = $4.5\ m^2 \times 0.919\ kN/m^2 \times [-0.5 – (+0.5)] = 4.13\ kN$
- For Negative Cpi , equivalent joint load = $4.5\ m^2 \times 0.919\ kN/m^2 \times [-0.5 – (-0.5)] = 0\ kN$

Results

Table 558: Wind loads on Face A at Joint 243

Result Type	Reference	STAAD.Pro	Difference	Comments
Wind direction +X, positive internal pressure	0.83	0.83	none	
Wind direction +X, negative internal pressure	4.96	4.96	none	
Wind direction -X, positive internal pressure	3.72	3.72	none	
Wind direction -X, negative internal pressure	0.41	0.41	none	
Wind direction +Z, positive internal pressure	4.13	4.13	none	
Wind direction -Z, positive internal pressure	4.13	4.13	none

V.Wind On Closed Structure 1

Evaluate the equivalent joint loads for a closed structure subjected to wind loads.

Details

A structure lying in YZ plane is composed of three members and is subjected to wind load from (+X) direction (i.e., out-of-plane). Those three members, along with the ground surface, form a closed panel. The wind load incident on that panel is converted to equivalent joint loads incident on the nodes by the program.

The exposure factor, e, for the structure is 0.85.

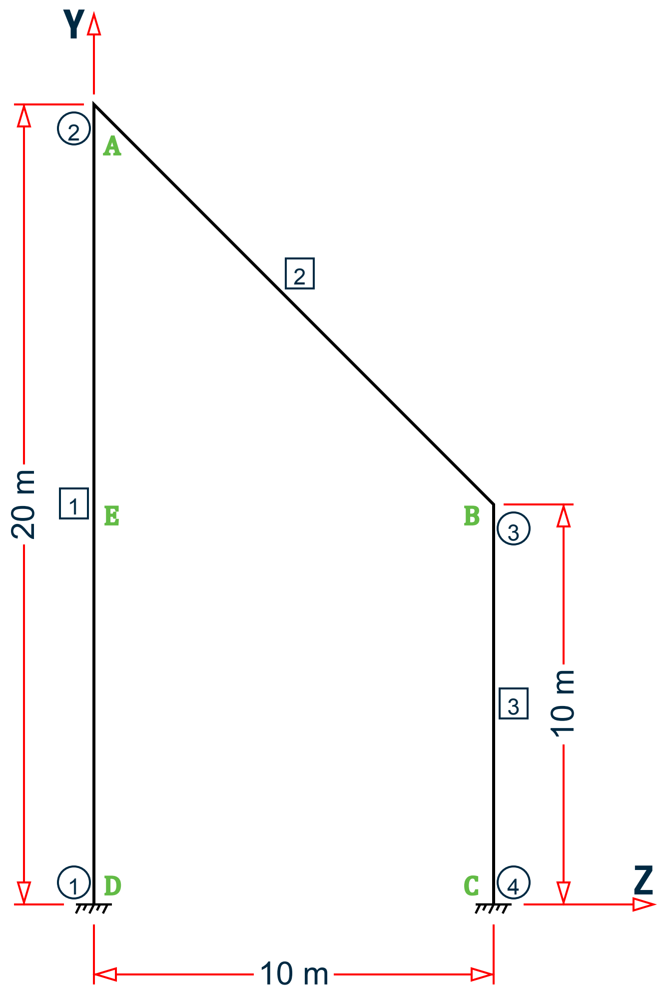

Table 559: Wind intensity variation with height above ground

Height (m)	Intensity of wind load (kg/m^2)
≤ 5m	1.5
5m - 10 m	2
10 m - 20 m	3

Validation

Determine CG of the Wind Area

Naming the nodal points A, B, C, and D, divide the area into two sub-areas: a rectangle and a triangle. The division is taken at the mid-point of member 1, which is at the same Y ordinate as node 3 (point B).

Area of the triangle ABE = $1/2 \times base \times height = 1/2 \times (10m) \times (10m) = 50\ m^2$

CG of triangle ABE: $\overline{X}_{ABE} = \frac{1}{3} 10 = 3.33\ m, \overline{Y}_{ABE} = 10 + \frac{1}{3} 10 = 13.33\ m$

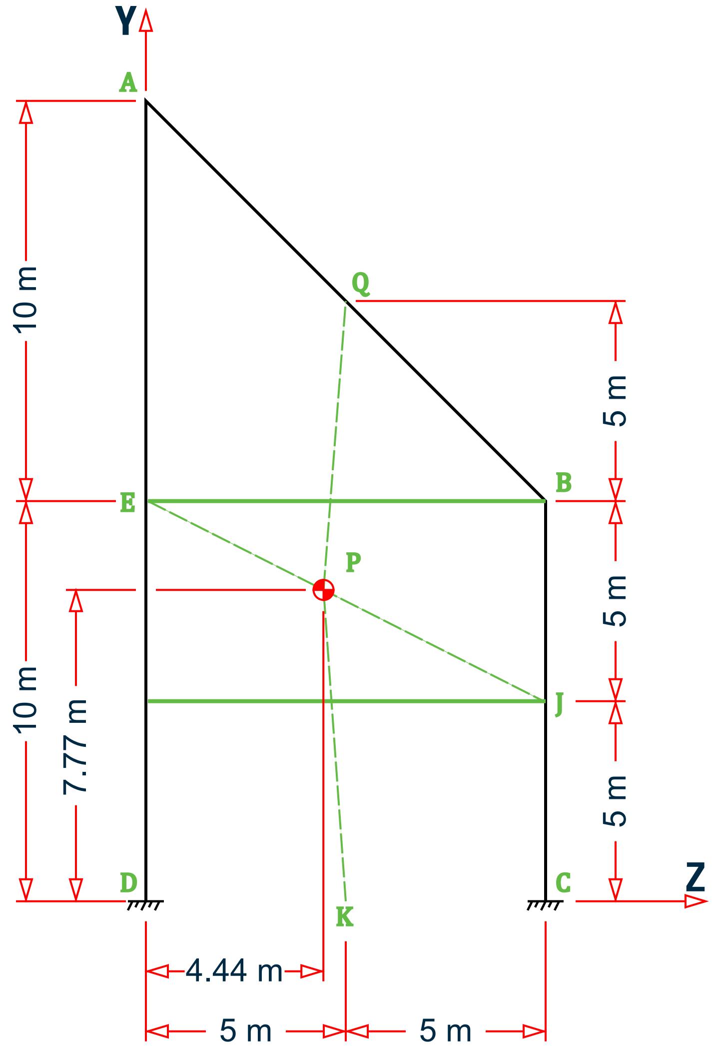
Area of rectangle BCDE = $10\ m \times 10\ m = 100\ m^2$

CG of rectangle BCDE: $\overline{X}_{BCDE} = \frac{1}{2}10 = 5\ m$, $\overline{Y}_{BCDE} = \frac{1}{2}10 = 5\ m$

CG of total area ABCD: $\overline{X} = \frac{50(3.33) + 100(5)}{50 + 100} = 4.44\ m$, $\overline{Y} = \frac{50(13.33) + 100(5)}{50 + 100} = 7.77\ m$

The CG is labeled point P.

The influence area of each joint is then take as the midpoint of the connecting members to this CG. Label the midpoints of each member E, Q, and J. The point at support level between nodes 1 and 2 is labeled K.



<u>Equivalent Joint Load on Node 2 (A)</u>

The influence area for node 2 is the shape formed by points A, Q, P, and E. Notice that this area can be decomposed into a trapezoid and two triangles. Also notice that this area has *two* different wind pressures, above and below y = 10m (which coincides with line EB). Label a point on line AE with the same Y coordinate as Q as N.

Determine the Z coordinate of where line EB intersects line PQ and label this point M.

slope of PQ = (15 - 7.77)/(5 - 4.44) = 13.0

z = 4.44 + (10 - 7.77)/13 = 4.615 m

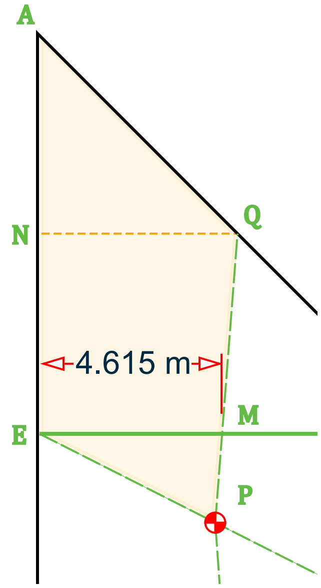


Figure 464: Influence area of point A

The sub-areas of AQPE:

$A_{EMP} = 0.5 \times (10 - 7.77) \times 4.615 = 5.13\ m^2$

$A_{NQME} = 0.5 \times (5+4.615) \times 5 = 24.04\ m^2$

$A_{ANQ} = 0.5 \times 5 \times 5 = 12.5\ m^2$

The equivalent joint load, F, is calculated as $Influence\ area,\ A,$ × $avg.\ wind\ pressure,\ p$ × $exposure\ factor,\ e$

$F = 0.85 \times [2 \times (5.13) + 3 \times (24.04 + 12.5)] = 101.90\ kN$

Equivalent Joint Load on Node 3 (B)

The influence area for node 3 is the shape formed by points B, J, P and Q. Label a point on line BJ with the same Y coordinate as P as point V.

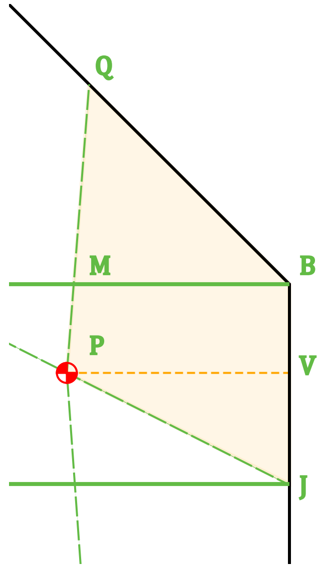

Figure 465: Influence area of point B

The sub-areas of BJPQ:

$$A_{BMQ} = 0.5\times(10 - 4.615)\times5 = 13.46 \text{ m}^2$$

$$A_{BVPM} = 0.5\times[(10 - 4.615) + (10 - 4.44)]\times(10 - 7.77) = 12.2 \text{ m}^2$$

$$A_{VJP} = 0.5\times(10 - 4.44)\times(7.77 - 5) = 7.72 \text{ m}^2$$

The equivalent joint load,

$$F = 0.85\times[2\times(12.2 + 7.72) + 3\times(13.46)] = 67.85 \text{ kN}$$

<u>Equivalent Joint Load on Node 4 (C)</u>

The influence area for node 4 is the shape formed by points C, K, P, and J. The change in pressure magnitude is at the same Y coordinate as point J. Label the point on line ED with this same Y coordinate as point R. Determine the Z coordinate of where line RJ intersects line PK and label this point W.

$$\text{slope of PK} = (7.77)/(5 - 4.44) = 14.0$$

$$z = 4.44 + (7.77 - 5)/14 = 4.643 \text{ m}$$

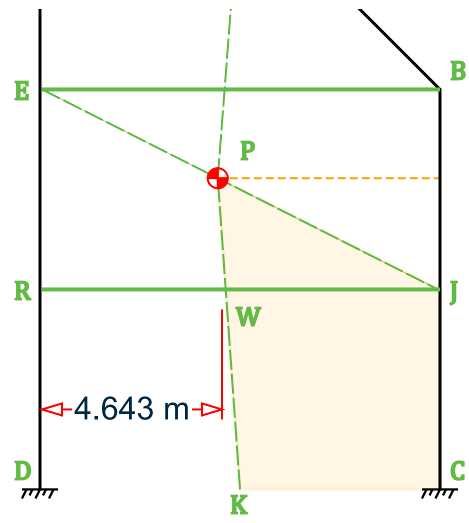

Figure 466: Influence area of point C

The sub-areas of CKPJ:

$$A_{JWP} = 0.5\times(7.77 - 5)\times(10 - 4.643) = 7.44 \text{ m}^2$$

$$A_{BVPM} = 0.5\times[(10 - 4.643) + 5]\times 5 = 25.89 \text{ m}^2$$

The equivalent joint load,

$$F = 0.85\times[1.5\times(25.89) + 2\times(7.44)] = 45.66 \text{ kN}$$

<u>Equivalent Joint Load on Node 1 (D)</u>

The influence area for node 1 is the shape formed by points D, E, P, and K. Label a point on line DE with the same Y coordinate as P as point L.

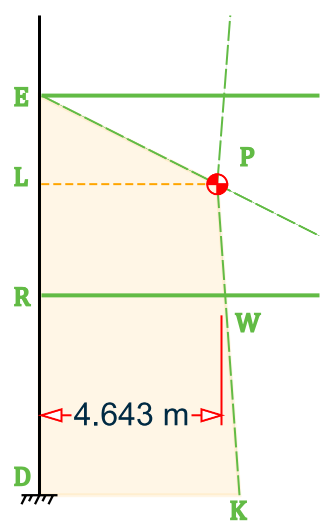

Figure 467: Influence area of point D

The sub-areas of DEPK:

$$A_{LEP} = 0.5\times(10 - 7.77)\times4.44 = 4.94 \text{ m}^2$$

$$A_{RLPW} = 0.5\times[4.44 + 4.643]\times(7.77 - 5) = 12.62 \text{ m}^2$$

$$A_{DRWK} = 0.5\times[4.643 + 5]\times5 = 24.11 \text{ m}^2$$

The equivalent joint load,

$$F = 0.85\times[1.5\times(24.11) + 2\times(4.94 + 12.62)] = 60.59 \text{ kN}$$

Results

Table 560: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Joint load at node 1 (kN)	60.59	60.59	none

V.Wind On Closed Structure 2

Evaluate the equivalent joint loads for a closed structure subjected to wind loads.

Details

A structure lying in YZ plane is composed of three members and is subjected to wind load from (+X) direction (i.e., out-of-plane). Those three members, along with the ground surface, form a closed panel. The wind load incident on that panel is converted to equivalent joint loads incident on the nodes by the program.

The exposure factor, e, for the structure is 0.85.

Note: This structure is similar to that in V.Wind On Closed Structure 1 (on page 3711) with an added node at the mid-point of the left column (Point E).

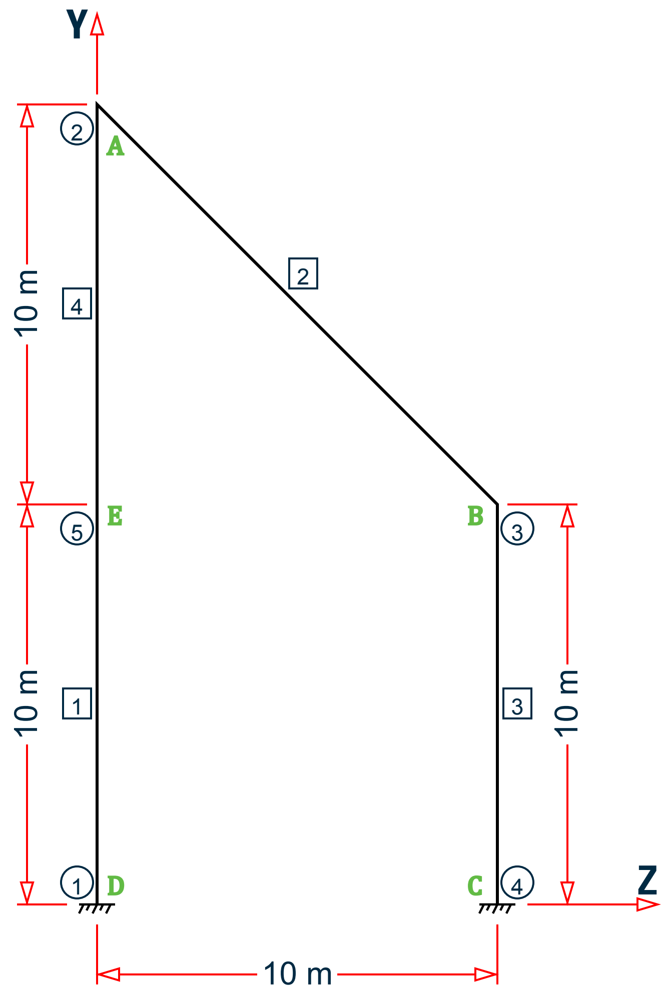

Table 561: Wind intensity variation with height above ground

Height (m)	Intensity of wind load (kg/m^2)
≤ 5m	1.5
5m - 10 m	2
10 m - 20 m	3

Validation

Determine CG of the Wind Area

Naming the nodal points A, B, C, D, and E, divide the area into two sub-areas: a rectangle and a triangle. The division is taken at nodes 5 and 3 (points E and B).

Area of the triangle ABE = $1/2 \times base \times height = 1/2 \times (10m) \times (10m) = 50\ m^2$

CG of triangle ABE: $\overline{X}_{ABE} = \frac{1}{3}10 = 3.33\ m, \overline{Y}_{ABE} = 10 + \frac{1}{3}10 = 13.33\ m$

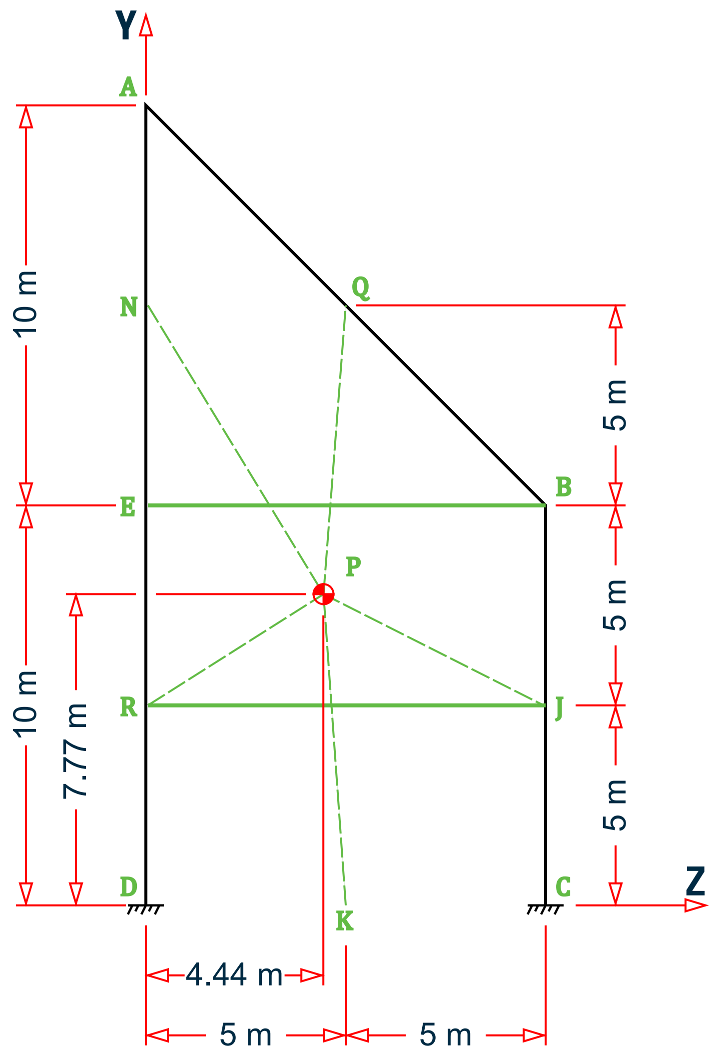
Area of rectangle BCDE = $10\ m \times 10\ m = 100\ m^2$

CG of rectangle BCDE: $\overline{X}_{BCDE} = \frac{1}{2} 10 = 5\ m$, $\overline{Y}_{BCDE} = \frac{1}{2} 10 = 5\ m$

CG of total area ABCD: $\overline{X} = \frac{50(3.33) + 100(5)}{50 + 100} = 4.44\ m$, $\overline{Y} = \frac{50(13.33) + 100(5)}{50 + 100} = 7.77\ m$

The CG is labeled point P.

The influence area of each joint is then take as the midpoint of the connecting members to this CG. Label the midpoints of each member R, N, Q, and J. The point at support level between nodes 1 and 2 is labeled K.



Equivalent Joint Load on Node 2 (A)

The influence area for node 2 is the shape formed by points A, Q, P, and N. Notice that this area can be decomposed into a trapezoid and two triangles. Also notice that this area has *two* different wind pressures, above and below y = 10m (which coincides with line EB).

Determine the Z coordinate of where line EB intersects line NP and label this point S.

slope of NP = (15 - 7.77)/(4.44) = 1.625

$z = 4.44 - (10 - 7.77)/1.625 = 4.615$ m

Determine the Z coordinate of where line EB intersects line PQ and label this point M.

slope of PQ = $(15 - 7.77)/(5 - 4.44) = 13.0$

$z = 4.44 + (10 - 7.77)/13 = 3.077$ m

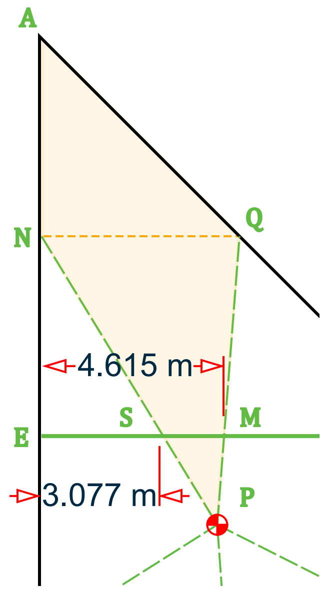


Figure 468: Influence area of point A

The sub-areas of AQPN:

$A_{SMP} = 0.5\times(10 - 7.77)\times(4.615 - 3.077) = 1.71\ m^2$

$A_{NQMS} = 0.5\times(5 + 4.615 - 3.077)\times5 = 16.35\ m^2$

$A_{ANQ} = 0.5\times5\times5 = 12.5\ m^2$

The equivalent joint load, F, is calculated as $Influence\ area,\ A,\ \times avg.\ wind\ pressure,\ p \times exposure\ factor,\ e$

$F = 0.85\times[2\times(1.71) + 3\times(16.35 + 12.5)] = 76.47$ kN

Equivalent Joint Load on Node 3 (B)

The influence area for node 3 is the shape formed by points B, J, P and Q. Label a point on line BJ with the same Y coordinate as P as point V.

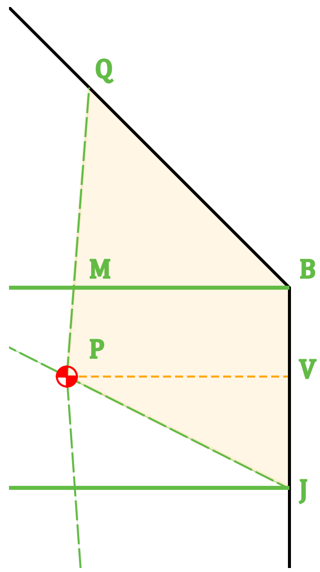

Figure 469: Influence area of point B

The sub-areas of BJPQ:

$$A_{BMQ} = 0.5\times(10 - 4.615)\times5 = 13.46\ m^2$$

$$A_{BVPM} = 0.5\times[(10 - 4.615) + (10 - 4.44)]\times(10 - 7.77) = 12.2\ m^2$$

$$A_{VJP} = 0.5\times(10 - 4.44)\times(7.77 - 5) = 7.72\ m^2$$

The equivalent joint load,

$$F = 0.85\times[2\times(12.2 + 7.72) + 3\times(13.46)] = 67.85\ kN$$

Equivalent Joint Load on Node 4 (C)

The influence area for node 4 is the shape formed by points C, K, P, and J. The change in pressure magnitude is at the same Y coordinate as point J. Label the point on line ED with this same Y coordinate as point R. Determine the Z coordinate of where line RJ intersects line PK and label this point W.

$$\text{slope of PK} = (7.77)/(5 - 4.44) = 14.0$$

$$z = 4.44 + (7.77 - 5)/14 = 4.643\ m$$

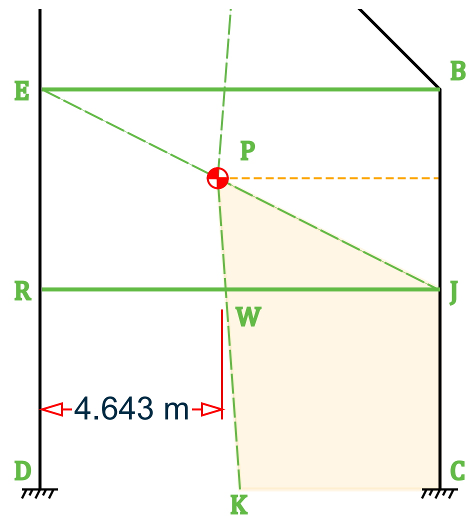

Figure 470: Influence area of point C

The sub-areas of CKPJ:

$$A_{JWP} = 0.5\times(7.77 - 5)\times(10 - 4.643) = 7.44 \text{ m}^2$$

$$A_{BVPM} = 0.5\times[(10 - 4.643) + 5]\times5 = 25.89 \text{ m}^2$$

The equivalent joint load,

$$F = 0.85\times[1.5\times(25.89) + 2\times(7.44)] = 45.66 \text{ kN}$$

<u>Equivalent Joint Load on Node 1 (D)</u>

The influence area for node 1 is the shape formed by points D, R, P, and K.

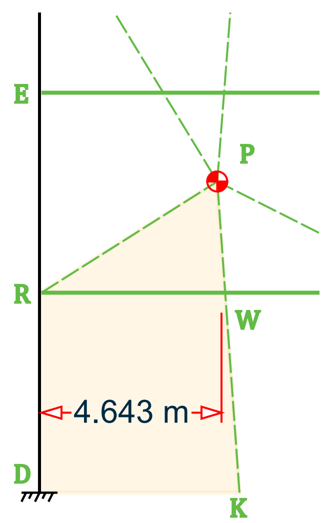

Figure 471: Influence area of point D

The sub-areas of DRPK:

$$A_{RPW} = 0.5\times(7.77 - 5)\times4.643 = 6.45 \text{ m}^2$$

$$A_{DRWK} = 0.5\times[4.643 + 5]\times5 = 24.11\ m^2$$

The equivalent joint load,

$$F = 0.85\times[1.5\times(24.11) + 2\times(6.17)] = 41.71\ kN$$

<u>Equivalent Joint Load on Node 5 (E)</u>

The influence area for node 5 is the shape formed by points N, P, and R. Label a point on line RE with the same Y coordinate as P as point L.

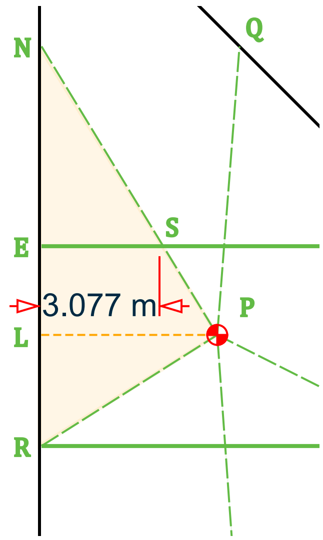

Figure 472: Influence area of point E

The sub-areas of NPR:

$$A_{NSE} = 0.5\times(5)\times3.077 = 7.69\ m^2$$

$$A_{ESPL} = 0.5\times[3.077 + 4.44]\times(10 - 7.77) = 8.36\ m^2$$

$$A_{LPR} = 0.5\times(4.44)\times(7.77 - 5) = 6.17\ m^2$$

The equivalent joint load,

$$F = 0.85\times[2\times(8.36 + 6.17) + 3\times(7.69)] = 44.31\ kN$$

Results

V. Wind On Open Structure

Validate the calculated member loads for an open structure subject to wind loading.

Details

A structure is subjected to wind loading from +X direction. The members are rectangular members with 500 mm × 500 mm in dimension. The diagonal member is also of same dimension but rotated at a beta angle value of 45°. Thus, the wind facing area of that member will be different than that of the other members.

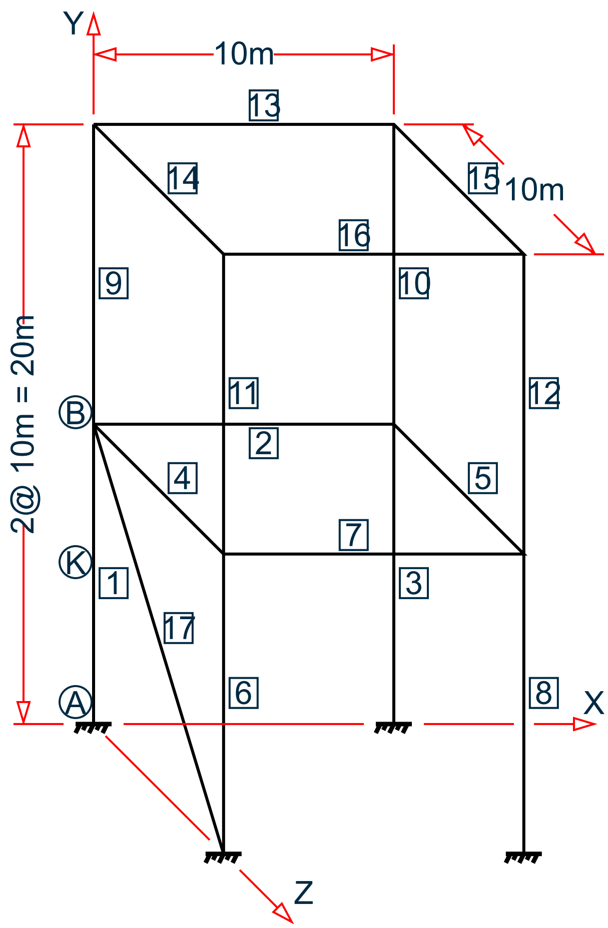

Table 563: Variation of wind intensity over structure height

Height (m)	Intensity of wind load (kN/m^2)
≤5	1.5
5 - 10	2
10 - 20	3

Validation

When open structures are subjected to wind load, wind load incident on the structure is applied as uniformly distributed loads on the members along the projected axis (i.e., in PX/PY/PZ direction). Wind intensity multiplied by the effective area of the member facing the wind load gives the uniformly distributed member load on the member.

Wind Load on Members 1,3, 6 & 8

Wind intensity varies between the length of the member, so different parts of the member will be subjected to uniformly distributed loads of different magnitudes.

Let the midpoint of member 1 be K. So, $AK = CK = 5\ m$

Up to Height 5 m (part AK)

Intensity of wind load = $1.5\ kN/m^2$
Area of the member facing the wind = $0.5\ m$
$w_{AK} = 1.5 \times 0.5 = 0.75\ kN/m$

Up to Height 10 m (part KB)

Intensity of Wind load = $2\ kN/m^2$
Area of the member facing the wind = $0.5\ m$
$w_{KB} = 2 \times 0.5 = 1\ kN/m$

Due to same orientation, member load on member 3, 6, and 8 will also be same as that of member 1.

<u>Wind Load on Member 9, 10, 11 & 12</u>

Intensity of wind load = $3\ kN/m^2$

Area of the member facing the wind = $0.5\ m$

$w = 3 \times 0.5 = 1.5\ kN/m$

Due to same orientation, member load on member 10, 11, and 12 will also be same as that of member 9.

<u>Wind Load on Member 4 & 5</u>

Intensity of wind load = $2\ kN/m^2$

Area of the member facing the wind = $0.5\ m$

$w = 2 \times 0.5 = 1.0\ kN/m$

Due to same orientation, member load on member 5 will also be same as that of member 4.

<u>Wind Load on Member 14 & 15</u>

Intensity of wind load = $3\ kN/m^2$

Area of the member facing the wind = $0.5\ m$

$w = 3 \times 0.5 = 1.5\ kN/m$

Due to same orientation, member load on member 15 will also be same as that of member 14.

<u>Wind Load on Member 2, 7, 13, & 16</u>

These members are aligned along the +X axis. Since the structure is subjected to wind load from +X direction only, the area of those members facing the wind is zero. So, there will be no load due to wind on these members.

<u>Wind Load on Member 17</u>

Since the member is rotated at a beta angle of 45°, the area of the member faceing the wind = $0.5\ m/cos45° = 0.707\ m$

Wind intensity varies between the length of the member, so different parts of the member will be subjected to uniformly distributed loads of different magnitudes.

Up to heigh 5m

Wind intensity = $1.5\ kN/m^2$
$w = 1.5 \times 0.707 = 1.061\ kN/m$

Up to height 10m

Wind intensity = $2\ kN/m^2$

$w = 2 \times 0.707 = 1.414\ kN/m$

Results

Table 564: Comparison of uniformly distributed load due to wind from +X on each member (kN/m)

Member No	Hand Calculation	STAAD.Pro	Difference	Comments
1, 3, 6 & 8	Up to 5m: 0.75 5m - 10m: 1	Up to 5m: 0.75 5m - 10m: 1	none	
4 & 5	1	1	none	
9, 10, 11, 12, 14, & 15	1.5	1.5	none	
17	Up to 5m: 1.061 5m - 10m: 1.414	Up to 5m: 1.0607 5m - 10m: 1.4142	negligible	

Note: Members with no loading under this load condition are not displayed.

V. Column Buckling Factor

Determine the buckling factor for a pinned-pinned column subject to an axial load.

Details

A 30 ft tall column with pinned ends is subject to a 160 kip axial load. The section is a W10x45 with a modulus of elasticity of 29,730 ksi.

Validation

Critical elastic buckling capacity:

$$P_{cr} = \pi^2 EI/\ell^2$$

$$P_{cr} = \pi^2(29{,}730)(248)/(30\times12)^2 = 561.5 \text{ k}$$

Buckling factor: $P_{cr}/P = 561.5\ /\ 160 = 3.509$

Results

Problem

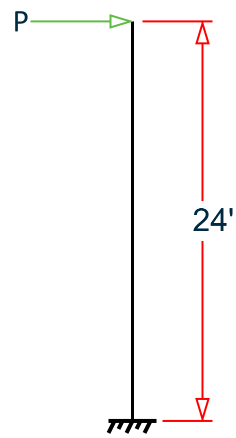

Figure 474: Cantilever member model

A transverse load P is applied to a cantilever member and increased until the member fails.

Member length = 24 inch

Section = Wide flange W16X77

Material = Steel

Expected yield strength = 36 ksi

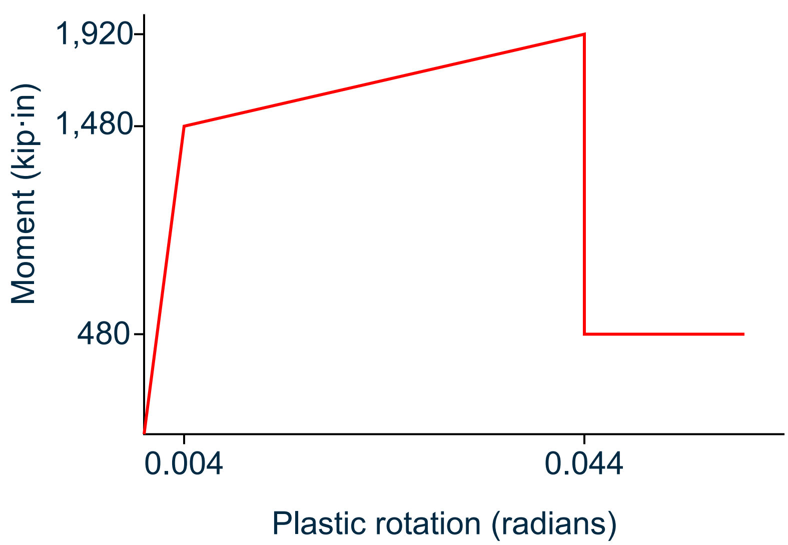

Figure 475: Plastic Rotation (in radians) vs. Moment (in in·kips) plot for moment hinge

Results from STAAD.Pro

Note: Pushover analysis requires the STAAD.Pro Advanced Analysis license.

The analysis results are saved at an interval of 0.1 inch deflection of the cantilever tip. The following results are displayed in the Postprocessing workflow by selecting the **Layouts** > **Pushover-Graphs** tool in the **Dynamics** group on the **Results** ribbon tab.

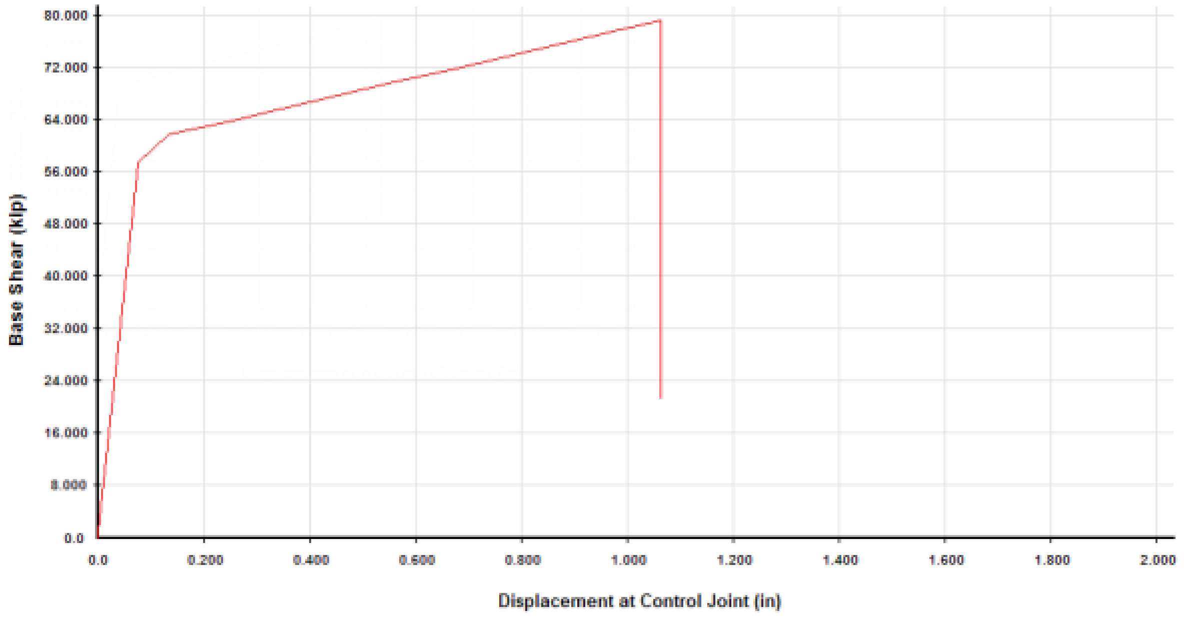

Figure 476: Capacity curve (Displacement at Control Joint, inches vs. Base Shear, kips) as calculated by STAAD.Pro

Table 567: Tabular form of the different points in Capacity curve as reported by STAAD.Pro

Load Step	Displacement in	Base Shear kip
1	0	0.153
2	0.001	1.153
3	0.078	57.837
4	0.136	61.953
5	0.243	63.979
6	0.349	65.979
7	0.455	67.979
8	0.562	69.979
9	0.668	71.979
10	0.774	73.979
11	0.880	75.979

Load Step	Displacement in	Base Shear kip
12	0.986	77.979
13	1.065	79.479
14	1.065	21.510

Results from hand calculation

<u>At Load Step 3</u>

Equation of elastic deflection at cantilever tip:

$$\delta_z = \frac{PL^3}{3EI} + \frac{PL}{GA_v}$$

where

P = 57.837 kip
L = 24 in.
E = 29,000 ksi
I = 138.0 in.^{4}
G = 11,154 ksi
A_v = 10.4323 in.^{2}

Thus elastic deformation:

$$\delta_z = \frac{57.837 \times 24^3}{3 \times 29,000 \times 138} + \frac{57.837 \times 24}{11,154 \times 10.4323} = 0.066 + 0.012 = 0.078\text{in.}$$

<u>At Load Step 13</u>

Equation of elastic deflection at cantilever tip

$$\delta_z = \frac{PL^3}{3EI} + \frac{PL}{GA_v}$$

where

P = 79.479 kip
(The other values are as listed for Load Step 3)

Thus elastic deformation at cantilever tip:

$$\delta_z = \frac{79.479 \times 24^3}{3 \times 29,000 \times 138} + \frac{79.479 \times 24}{11,154 \times 10.4323} = 0.092 + 0.016 = 0.108\text{in.}$$

Plastic rotation = 0.04 radian.

Since STAAD.Pro assumes small displacements (sinθ = θ), plastic deformation at cantilever tip

$$\delta_{z\ plastic} = L \times \theta = 24 \times 0.04 = 0.96 \text{ inch}$$

Total deflection = $\delta_{z\ elastic} + \delta_{z\ plastic} = 0.108 + 0.96 = 1.068\ inch$

Comparison

Table 568: Comparison of results

Load Step	Force P (free end) kips	Deflection (free end) in		Percent Difference
		STAAD.Pro Advanced Analysis	Hand Calculation	
3	57.837	0.078	0.078	none
13	79.479	1.065	1.068	negligible

Note: The deflection results from STAAD.Pro shown in the above table were obtained in the Postprocessing workflow.

V. Direct Analysis of a Beam

Verify the maximum bending moment and deflection of a beam using the direct analysis method.

Reference

American Institute of Steel Construction. 2005. *Specifications for Structural Steel Buildings.* Chicago, IL:AISC. p. 16.1-435, Case 1

Related Links

- *G.17.2.1.4 AISC 360 Direct Analysis* (on page 2144)

Details

A 40' long, simply-supported beam is subject to a uniformly distributed load of 100 lbs/ft and axial compression of 100 kips. The section is a W10x60 ($I_z = 341\ in^4$).

Validation

The maximum moment and deflection both occur at mid-span.

<u>Maximum moment</u>

$$M_{MAX} = M_0\left[\frac{2(\sec u - 1)}{u^2}\right]$$

where

$$M_0 = \frac{wL^2}{8} = \frac{0.1(40)^2}{8} = 20\ ft \cdot k$$

$$u = \sqrt{\frac{PL^2}{4EI}} = \sqrt{\frac{100 \times (40)^2 \times (12)^2}{4 \times 29{,}000 \times 341}} = 0.763$$

$$\frac{2(\sec u - 1)}{u^2} = \frac{2[\sec(0.763) - 1]}{0.763^2} = 1.318$$

Therefore, the maximum moment is: $20 \times 1.318 = 26.36\ ft \cdot k$

<u>Maximum deflection</u>

$$\delta_{MAX} = \delta_0\left[\frac{12(2\sec u - u^2 - 2)}{5u^4}\right]$$

where

$$\delta_0 = \frac{5wL^4}{384EI} = \frac{5(0.1)(40)^4(12)^3}{384(29{,}000)(341)} = 0.582\ in$$

$$\frac{12(2\sec u - u^2 - 2)}{5u^4} = \frac{12(2\sec(0.763) - (0.763)^2 - 2)}{5(0.763)^4} = 1.310$$

Therefore, the maximum deflection is: $0.582 \times 1.310 = 0.763\ in$

Results

Table 569: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
M_{MAX} (ft·k)	26.36	26.308	negligible	
δ_{MAX} (in)	0.763	0.757	negligible	

Note: The maximum moment and deflection results are taken from the Postprocessing workflow Beam Results and Displacements pages, respectively.

V. Direct Analysis of a Column

Verify the maximum bending moment and deflection of a column using the direct analysis method.

Reference

American Institute of Steel Construction. 2005. *Specifications for Structural Steel Buildings.* Chicago, IL:AISC. p. 16.1-435, Case 2

Related Links

- *G.17.2.1.4 AISC 360 Direct Analysis* (on page 2144)

Details

A 25' tall cantilevered column (i.e., a flagpole) is subject to an axial load of 30 kips. The section is a W8x18 ($I_z = 61.9\ in^4$).

Validation

A notional load factor of 0.003 is used. Therefore, the horizontal notional load at the top (free end) of the column is $H = 0.03 \times 30 = 0.09\ kips$.

Maximum moment

The maximum moment occurs at the fixed base.

$$M_{MAX} = M_0\left[\frac{\tan a}{a}\right]$$

where

$$M_0 = HL = 0.09 \times 25 = 2.25\ ft \cdot k$$

$$a = \sqrt{\frac{PL^2}{EI}} = \sqrt{\frac{30 \times (25)^2 \times (12)^2}{29{,}000 \times 61.9}} = 1.226$$

$$\frac{\tan a}{a} = \frac{\tan(1.226)}{1.226} = 2.273$$

Therefore, the maximum moment is: $2.25 \times 2.273 = 5.115\ ft \cdot k = 61.37\ in \cdot k$

Maximum deflection

The maximum deflection occurs at the free end.

$$\delta_{MAX} = \delta_0\left[\frac{3(\tan, a, -, a)}{a^3}\right]$$

where

$$\delta_0 = \frac{HL^3}{3EI} = \frac{(0.09)(25)^3(12)^3}{3(29{,}000)(61.9)} = 0.451\ in$$

$$\frac{3(\tan, a, -, a)}{a^3} = \frac{3(\tan(1.226) - 1.226)}{1.226^3} = 2.537$$

Therefore, the maximum deflection is: $0.451 \times 2.537 = 1.145\ in$

Results

Table 570: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
M_{MAX} (in·k)	61.37	61.36	negligible

V. Single Column P-Delta Analysis

Determine the support forces at the base of the column.

Details

A 12 ft tall column with a fixed base and free end is subject to a 3 kip axial load and a 5 kip lateral load. The section is a W8x10 using steel with a modulus of elasticity of 29,000 ksi.

Validation

Moment at the base including P-Delta

$$M = H \times L + P \times \Delta$$

where

H	=	the lateral load
L	=	the length of the column
P	=	the axial compression load
Δ	=	the displacement due to the lateral load at the free end of the column

$$\frac{H L^3}{3EI} = \frac{5 \times (144)^3}{3 \times 29{,}000 \times 30.80} = 5.57 \text{ in}$$

Therefore, the moment is:

$$M = 5\ (144) + 3\ (5.57) = 736.72 \text{ in}\cdot\text{kip}$$

Results

Table 571:

Parameter	Reference	STAAD.Pro	Difference	Comment
Base moment (ft·kip)	736.72	736.72	none

V.08 Dynamic Analysis

V. Beam Subject to response spectrum

Find the maximum moment due to the time history loading and compare theoretical answers to the STAAD solution.

Reference

1. Biggs, John M., *Introduction to Structural Dynamics*, McGraw Hill, 1964, pp. 256-263
2. Blevins, Robert D., *Formulas for Natural Frequency and Mode Shape*, Van Nostrand-Reinhold, 1979.

Problem

The supports of a simply supported beam are subjected to an acceleration time history. The maximum bending moment in the beam is computed for the first mode of the structure. This problem demonstrates the capabilities of STAAD to calculate the correct modal response of a structure utilizing response spectrum data.

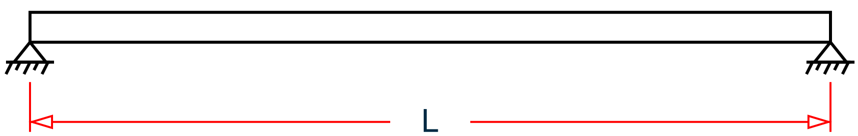

Figure 477: Simple span beam

$L = 240$ in.

The STAAD model consists of 11 nodes and 10 elastic beam elements. Node 1 is completely restrained with the exception of having rotational freedom in the Z direction, the remaining nodes are restrained except for X and Y displacements and Z rotations. Node 11 is additionally restrained against displacements in the Y direction to provide for the simple support condition . Only the contribution of the first mode of the structure is considered.

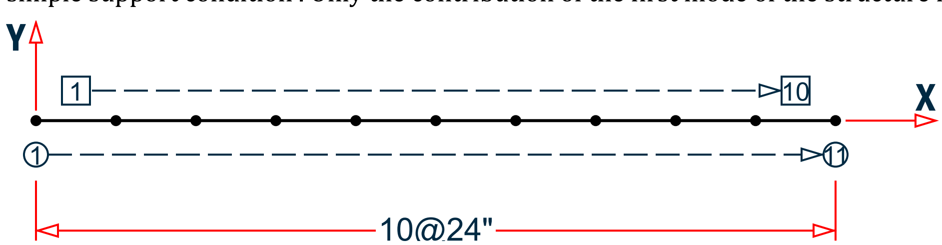

Figure 478: Finite element model

Theoretical Solution

Material Properties

$E = 30 \times 10^6$ lb/in^2

$EI = 1.0 \times 10^{10}$ lb-in^2

$m = 0.2$ lb-sec^2 / in^2

$h = 14.0$ in.

From Reference 2, Table 8-1, page 108, the fundamental frequency of the beam is:

$$f_i = \frac{\lambda_i^2}{2\pi l^2}\sqrt{\frac{EI}{m}} = \frac{9.869}{2\pi(240)^2}\sqrt{\frac{1.0(10)^{10}}{0.2}} = 6.098hz$$

The modal participation factor for the fundamental mode is:

$$\Gamma = \frac{\int_0^1 m\phi(x)\ d\ x}{\int_0^1 m\phi^2(x)\ d\ x}$$

Where the first mode shape, $\varphi(x) = sin(\pi x / 1)$

$$\Gamma = \frac{m\int_0^1 \sin\frac{\pi x}{1}\ d\ x}{m\int_0^1 \sin^2\frac{\pi x}{1}\ d\ x} = 4 \Big/ \pi$$

The maximum relative modal displacement is given by:

$A_{max} = \Gamma u^0{}_{max}$

where

$u^0{}_{max}$	=	$y''_{so} / \omega^2 (DLF)_{max}$
ω	=	$2\pi * 6.098Hz$
y''_{so}	=	$1.0g$
$(DLF)_{max}$	=	1.648 at 6.098 Hz

therefore:

$A_{max} = 4(1.648)(386.4)/[\pi(2\pi)^2(6.098)^2] = 0.5523$ in.

The bending moment

$M = -EI\delta^2 u/(\delta x^2)$

Where u for the first mode = A sin(πx/l)

$\delta^2 u/(\delta x^2) = -\pi^2/l^2 A \cdot \sin(\pi x/l)$

$M = AEI \cdot (\pi^2/l^2) \cdot \sin(\pi x/l)$

$M_{max} = A_{max} EI \cdot (\pi^2/l^2)$

at $x = l/2$

$M_{max} = 1(10)^{10} \cdot (0.5523) \cdot \pi^2/(240^2) = 946.351(10)^3$ lb·in

at x=l/2

Comparison

V. First Modal Frequency of a Cantilever Beam

To calculate the Natural frequency of vibration for a rectangular cantilever beam with a mass at the free end.

Reference

Hand calculation using known formulas.

Problem

Find the natural frequency of vibration, ω, of the cantilever beam.

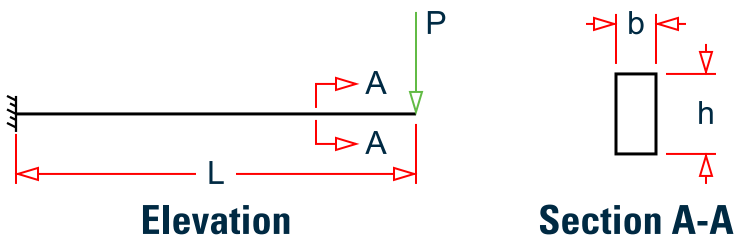

Figure 479: Cantilever beam with mass at free end

E = 30,000 ksi

h = 12.0 in

b = 6.0 in

P = 10.0 k

L = 120 in

Hand Calculations

Stiffness at free end:

$$k = 3EI/L^3 = 45 \text{ k/in}$$

Mass

$$m = w/g = 10.0 \text{ k} / (386.4 \text{ k-sec}^2/\text{in}) = 0.02588 \text{ k-sec}^2/\text{in}$$

Circular frequency:

$$\omega = \sqrt{\frac{k}{m}} = \sqrt{\frac{45}{0.02588}} = 41.7 \text{rad/sec}$$

= 6.637 cycles/sec

Comparison

Table 573: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Frequency, f (Hz)	6.637	6.633	none

STAAD Input

V. Modal Frequencies of a Simply Supported Beam

To find the natural frequencies of vibration for a simply supported beam.

Reference

Roark's Formulas for Stress and Strain, Warren C. Young, McGraw Hill, 6th edition.

Problem

Find the first five flexural natural frequencies of the simple beam. Neglect shear deformation and rotary inertia.

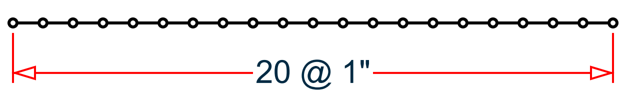

Figure 481: Model for dynamic beam no. 7

E = 10,000 ksi

density = 0.1 lb/in^3

A_x = 2.0 in^2

$I_x = 0.6667\ in^4$

$L = 20$ in

Hand Calculations

Weight

$w_{weight} = Ax * density = 2.0\ (0.1) = 0.2$ lb/in

$w_{mass} = 0.2\ /(386.4) = 0.000518$

From Table 36, Item 1b of the reference:

$$f_n = \frac{k_n}{2\pi}\sqrt{\frac{EI}{wl^4}} = \frac{k_n}{2\pi}\sqrt{\frac{10(10)^6(0.6667)}{0.000518(20)^4}} = 45.16 \cdot k_n$$

Table 575: Modal stiffness and natural frequencies

V. Modal Response of a 3D Frame

Find the natural frequencies of a space frame. Compare the results from subspace iteration method used by STAAD.Pro with the results from EASE2® and ANSYS®.

Reference

1. Problem 1, from the ASME 1972 Program Verification and Qualification Library
2. DeSalvo, G.J., and Swanson, J.A., *ANSYS Engineering Analysis System Examples Manual*, Swanson Analysis Systems, Inc., 1979, Example Problem No. 2.
3. Peterson, F.E., *EASE2 Elastic Analysis for Structural Engineering Example Problem Manual*, Engineering Analysis Corporation, 1981, Example 2.03.

Problem

A three dimensional frame is analyzed for its natural frequencies and the associated mode shapes using the subspace iteration method offered by STAAD.Pro.

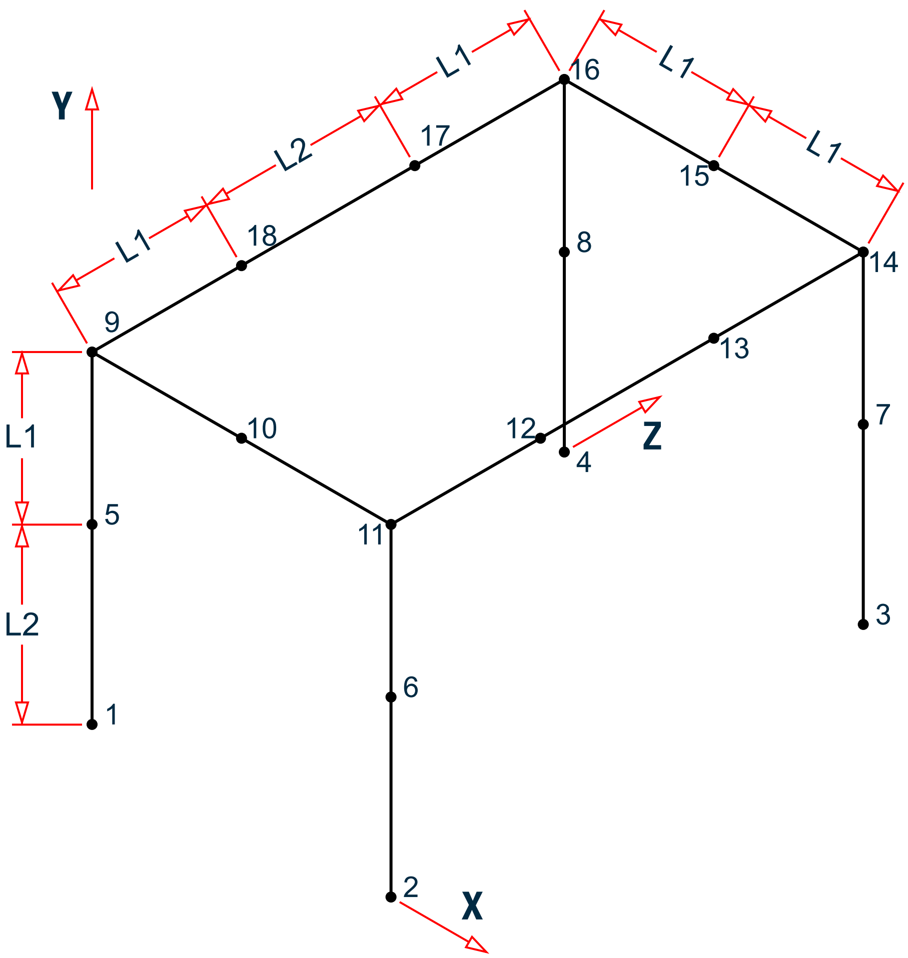

Figure 482: Frame model

L1 = 8.625 ft
L2 = 10 ft

All dimensions are in inches.

The only entity present in the model is the general purpose three dimensional beam.

Cross-section Properties

All the beam elements have the same cross section:

Outside radius, $R_o = 1.1875$ *in.*
Inside radius, $R_i = 1.0335$ *in.*
Area, $A = \pi(R_o^{\ 2} - R_i^{\ 2}) = 1.074532\ in^2$
Moment of Inertia, $I = \pi/4(R_o^{\ 4} - R_i^{\ 4})$
$I = 0.665747\ \text{in}^4$
Torsion constant = twice the inertia, for closed circular sections = $1.331494\ in^4$

The expression for the shear flexibility factor is derived from the ratio of maximum shear stress to the average shear stress:

$\alpha = AQ/Ib$

Where the four items – A, Q, I, and b are properties of the half cross-section about the centerline. For the circular section they are:

$A = \pi/2(Ro^2 - Ri^2)$

$Q = 2/3(Ro^3 - Ri^3)$

$I = \pi/8(Ro^4 - Ri^4)$

$I = 2(Ro - Ri)$

The final expression for the shear flexibility factor, for a circular tube section is:

$$\alpha = \frac{AQ}{Ib} = \frac{4}{3}\frac{R_o^3 - R_i^3}{\left(R_o^2 - R_i^2\right)\left(R_o - R_i\right)}$$

$\alpha = 1.993620$

Hence the shear area is entered as

AY = Cross Section Area / α = 1.074532 / 1.99362 = 0.538985 in^2

Comparison

The following table compares Twenty-Four Natural Frequencies

Table 577: Comparison of results

Mode Number	DeSalvo and Swanson[2]	Peterson[3]	STAAD.Pro
1	111.52	111.53	111.236
2	115.95	115.96	115.801
3	137.60	137.61	137.169
4	218.02	218.03	215.799
5	404.23	404.23	404.270
6	422.70	422.72	422.642
7	451.72	451.75	451.599
8	553.99	554.07	549.012
9	735.70	735.81	733.589
10	762.32	762.44	758.563
11	852.57	852.72	851.354

Mode Number	DeSalvo and Swanson[2]	Peterson[3]	STAAD.Pro
12	894.08	894.26	892.281
13	910.21	910.40	893.060
14	916.98	917.18	910.829
15	940.02	940.02	932.286
16	959.98	960.27	956.391
17	971.15	971.44	964.012
18	976.92	977.22	967.267
19	1012.2	1012.5	981.536
20	1028.4	1028.8	1009.256
21	1123.6	1123.9	1070.562
22	1134.5	1134.9	1123.161
23	1164.1	1164.4	1149.368
24	1216.7	1217.2	1199.882

In both references by DeSalvo and Swanson[2] and Peterson[3], the number of dynamic degrees of freedom has been reduced from 42 to 24, by means of the Guyan method. No such reduction is performed in the STAAD.Pro model.

V. Modal Response of a Beam

Find the natural frequencies for a beam and compare theoretical answers to the STAAD.Pro solution.

Reference

Timoshenko, S., *Vibration Problems in Engineering*, Third Edition, D. Van Nostrand Company, Inc., 1955, page 322

Problem

The first five natural frequencies and the associated mode shapes are computed for the flexural motion of a simply supported beam.

Figure 483: Simple beam diagram

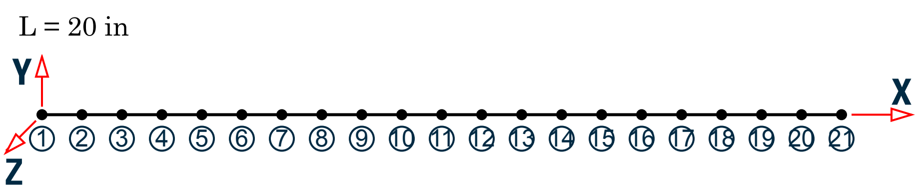

Figure 484: Finite element model

The simply supported beam is divided into twenty spanwise beam elements. At nodes 1 and 21, all degrees of freedom except the rotation about the Z axis are restrained. For the remaining nodes, only the translation along Y and the rotation about Z are permitted. Both shear deformation and rotary inertia have been excluded from the model. The mass matrix is a diagonal matrix.

Cross-section Properties

Rectangular Section: 1 inch Width x 2 inch Depth

Area = 2 in^2

$$J = \frac{b^3 a}{16}\left\{\frac{16}{3} + 3.36\left(\frac{b}{a}\right)\left[1 - \frac{1}{12}\left(\frac{b}{a}\right)^4\right]\right\}$$

where

a	=	2
b	=	1
J	=	0.4578 inch^4
I_2	=	$1 \times 2^3/12$ inch^4
I_3	=	$2 \times 1^3/12$ inch^4

Theoretical Results

The natural bending frequencies, for a uniform beam with hinged ends, are given by:

$$f_n = \frac{\pi m^2}{2l^2}\sqrt{\frac{EIg}{A\gamma}}$$

where

f_n	=	natural frequency for mode n, in cycles per second
l	=	span of the beam
E	=	elastic modulus
I	=	cross-section moment of inertia
g	=	gravitational constant
A	=	cross-section area
γ	=	weight density

The parameters used in the frequency equation are:

$l = 20\ in$
$E = 10x10^6\ psi$
$I = 0.6667\ in^4$
$g = 386.4\ in/s^2$
$A = 2.0\ in^2$
$\gamma = 0.1\ lbs/in^3$

from which:

$$f_n = n^2 x\ 445.686$$

Comparison

The table below shows the natural frequencies computed from the theoretical equation and the subspace iteration method available within STAAD.Pro. Frequencies are in cycles per second.

Table 578: Comparison of results

Mode Number	Theoretical	STAAD.Pro	Difference
1	445.686	445.506	negligible
2	1,782.74	1,782.012	negligible
3	4,011.17	4,009.410	negligible
4	7,130.97	7,127.250	negligible
5	11,142.1	11,134.253	negligible

V. Modal Response of a Circular Plate

Find the natural frequencies of a circular plate and compare theoretical answers to the STAAD solution.

Reference

Blevins, Robert D., *Formulas for Natural Frequency and Mode Shape*, Van Nostrand Reinhold Company, 1979, Page 240.

Problem

A flat circular plate is simply supported around the entire perimeter. The first six modes and their associated natural frequencies are to be computed using the subspace iteration method offered by STAAD. This problem demonstrates that the natural frequencies of an axi-symmetric structure can be accurately computed utilizing a 180 degree model with the appropriate boundary conditions.

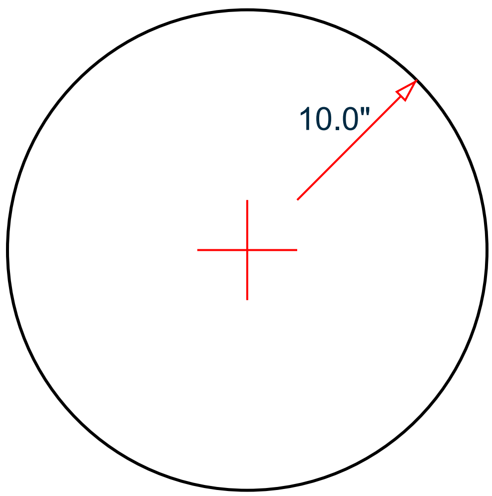

Figure 485: Diagram of circular plate

The 180 degree sector was modeled using radial lines at intervals of 15 degrees. Tangential lines were then located utilizing a relationship such that the aspect ratio of the quad-plate elements was approximately 1.0. All rotations normal to the plane of the plate were restrained. In-plane translations for all nodes were restrained because the theoretical solution does not consider in-plane effects. Rotations about the global Y axis for the nodes at X=0.0 were restrained because this is a symmetry boundary. Z translation of all nodes on the outside radius were restrained to provide for the simply-supported condition.

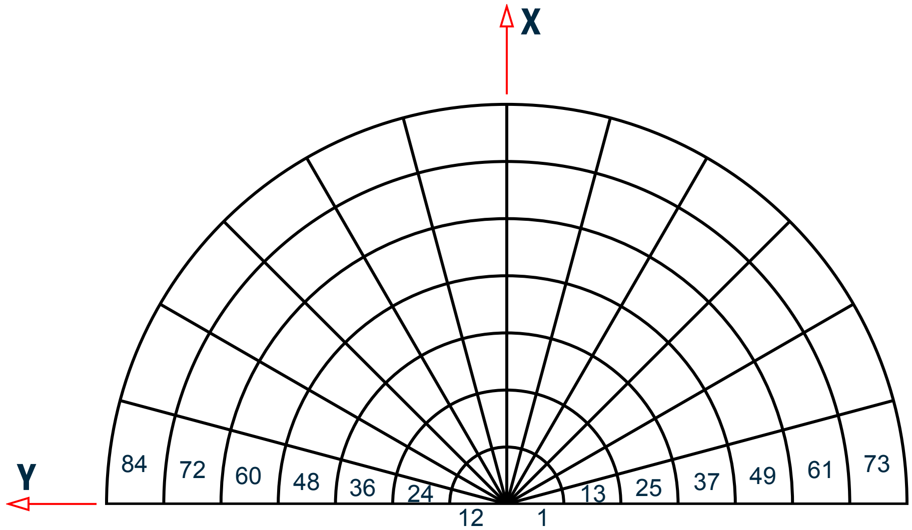

Figure 486: Finite model for half circular plate

It should be noted that the outside edge of the plate is a series of secant lines instead of a true arc. This will result in a loss of about 1% of the plate's true mass or about .5% of the mass that is effective for this problem.

Therefore, it is not unlikely that a few natural frequencies will be lower than the theoretical values instead of higher which is typical for a finite element analysis using plate elements. In addition, a true simple-support condition for this problem would require restraining the component of rotation that is radial to the outside edge.

Theoretical Calculations

From the reference case 2 in Table 11-1, the first six natural frequencies of the plate are described by the following equation:

$$f_{ij} = \frac{\lambda_{ij}^2}{2\pi a^2}\sqrt{\frac{Eh^3}{12\gamma\left(1-\nu^2\right)}}$$

= dimensionless parameter associated with the mode indices i,j

where

i	=	number of nodal diameters in this mode shape
j	=	number of nodal circles in this mode shape not counting the boundary
ν	=	Poisson's ratio
E	=	elastic modulus
h	=	plate thickness
γ	=	mass of plate per unit area
a	=	radius of plate

The numerical values used for this example are:

v = 0.30

E = 10.0×10P^6 psi

h = 0.10 inches

$$\gamma = \frac{\left(0.10 \text{ lb}_m / \text{in}^3\right)\left(0.10 \text{ in}\right)}{\left(386.4 \text{ lb}_m \cdot \text{in/lb}_f \cdot \text{s}^2\right)} = 2.588 \times 10^{-5} \text{ in/lb}_f \cdot \text{s}^2 \Big/ \text{in}^3$$

a = 10.0 inches

with the numerical values used above

$$\frac{1}{2\pi a^2}\sqrt{\frac{Eh^3}{12\gamma\left(1-\nu^2\right)}} = \frac{1}{2\pi(10.0)^2}\sqrt{\frac{\left(10.0 \cdot 10^6\right)(0.10)^3}{12\left(2.588 \cdot 10^{-5}\right)\left[1-(0.3)^2\right]}} = 9.467 \text{ cycles/sec.}$$

λ^2_{ij} is tabulated from the reference as follows:

Table 579: Values of λ^2_{ij}

Mode Number	λ^2_{ij}	Number of Nodal Diameters (i)	Number of Nodal Circles (j)
1	4.977	0	0
2	13.94	1	0
3	25.65	2	0
4	29.76	0	1
5[l]		3	0
6	48.51	1	1

[l] not tabulated in the reference

Comparison

Table 580: Comparison of results

Mode Number	Theoretical	STAAD.Pro	Difference
1	47.12	46.211	1.9%
2	132.0	130.541	1.1%
3	242.8	240.146	1.1%
4	281.7	283.028	0.5%
5 *		373.197	n/a*
6	459.3	466.579	1.6%

*The reference did not tabulate a value of for the fifth mode of the structure, hence a comparison with the theoretical value of this mode cannot be made.

All anti-symmetric mode shapes for the 360 degree circular plate were captured by the 180 degree model with a phase angle included in the calculation. Some of the difference between the theoretical and STAAD.Pro frequencies is attributed to the loss of mass due to the piecewise secant representation of the outer radius and, since this mass is about 1 percent lower than for a true circular plate, it is not surprising that the first few modes are lower than the theoretical solution.

V. Modal Response of a Rectangular Plate

Find the natural frequencies of a rectangular plate and compare theoretical answers to the STAAD.Pro solution.

Reference

Blevins, Robert D., *Formulas for Natural Frequency and Mode Shape*, Van Nostrand Reinhold Company, 1979, page 258.

Problem

A flat rectangular plate is simply supported on all four sides. The first six modes and their associated natural frequencies are to be computed for this structure using the subspace iteration method offered by STAAD.Pro. This problem also demonstrates that the mesh refinement can be chosen to accurately calculate modes of interest based on the expected mode shapes.

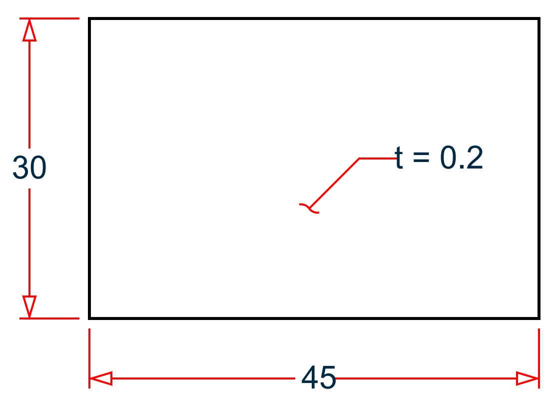

Figure 487: Simply supported, rectangular plate

L = 45 in., W = 30 in., t = 0.2 in.

A plate with an aspect ratio of 1.5 was used so that comparison could be made with theoretical results tabulated for plates in the reference. An equally spaced mesh was utilized in both the x and the y dimensions of the plate. The number of elements in each dimension was determined on the basis of the highest mode of interest. Since the number of half-waves in the sixth mode is 3 in the length dimension and 2 in the width dimension, a node spacing of 3.75 inches results in each half- wave being represented by four elements which means that no element will be expected to deform in double curvature. The simply supported edge condition requires that translation normal to the plane of the plate be restrained for these edge nodes. Rotations normal to the plate were restrained for all nodes.

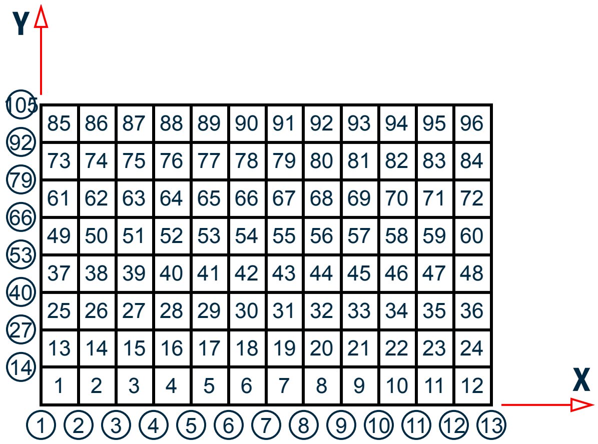

Figure 488: Model: finite element meshed

Theoretical Calculations

From the reference case 16 in Table 11-4, the first six natural frequencies of the plate are described by the following equations:

dimensionless parameter associated with the mode indices i, j

$$f_{ij} = \frac{\lambda_{ij}^2}{2\pi a^2}\sqrt{\frac{Eh^3}{12\gamma\left(1 - \nu^2\right)}}$$

where

i	=	number of half-waves in this mode shape along the horizontal axis
j	=	number of half-waves in this mode shape along the vertical axis
ν	=	Poisson’s ratio
E	=	elastic modulus
h	=	plate thickness
γ	=	mass of material per unit area
a	=	length of plate
b	=	width of plate

The numerical values used for this example are:

$\nu = 0.30$
$E = 30.0\times10^6$ psi
$h = 0.2$ inches

$$\gamma = \frac{\left(0.282\ \mathrm{lb}_m / \mathrm{in}^3\right)\left(0.20\ \mathrm{in}\right)}{\left(386.4\ \mathrm{lb}_m \cdot \mathrm{in/lb}_f \cdot \mathrm{s}^2\right)} = 0.146 \times 10^{-4}\ \mathrm{in/lb}_f \cdot \mathrm{s}^2 \Big/ \mathrm{in}^3$$

$a = 45.0\ in$
$b = 30.0\ in$

with the numerical values used above

$$\frac{1}{2\pi a^2}\sqrt{\frac{Eh^3}{12\gamma\left(1-\nu^2\right)}} = \frac{1}{2\pi(10.0)^2}\sqrt{\frac{\left(30.0\cdot 10^6\right)(0.20)^3}{12\left(1.460\cdot 10^{-4}\right)\left[1-(0.3)^2\right]}} = 0.9644 \text{ cycles/sec.}$$

$\lambda^2{}_{ij}$ is tabulated from the reference as follows:

Table 581: Values of $\lambda^2{}_{ij}$

Mode Number	$\lambda^2{}_{ij}$	Number of Half-Waves in Length (i)	Number of Half-Waves in Width (j)
1	32.08	1	1
2	61.69	2	1
3	98.70	1	2
4	111.0	3	1
5	128.3	2	2
6	177.7	3	2

Comparison

Table 582: Comparison of results

Mode Number	Theoretical	STAAD.Pro	Difference
1	30.94	30.599	1.1%
2	59.49	58.724	1.3%
3	95.18	95.063	negligible
4	107.1	106.277	0.8%
5	123.7	122.092	1.3%
6	171.3	168.009	1.9%

As noted earlier, the node spacing was based on the highest mode of interest. It follows that the difference between the theoretical and STAAD.Pro frequencies generally increases with increasing mode sequence.

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\08 Dynamic Analysis\Modal Response of a Rectangular Plate.STD` is typically installed with the program.

V. Natural Frequency of a 2D Truss

To calculate the Natural frequency of vibration for a two story truss.

Reference

Hand calculation using known formula.

Problem

Find the natural frequency of vibration, *f*, of the truss.

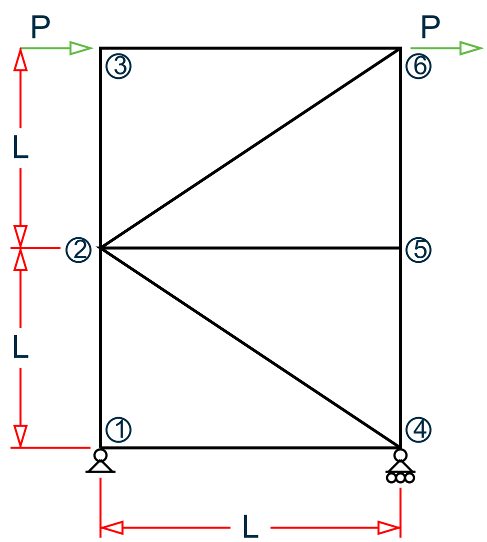

Figure 489: Space truss

E = 30,000 ksi

L = 10 ft

P = 10 kips

All members are L4x4x5/16

Hand Calculation

Calculate average deflection at top:

$$\delta_{avg} = (0.45255 \text{ in} + 0.43535 \text{ in})/2 = 0.444 \text{ in}$$

Stiffness of truss:

$$k = P/\delta_{avg} = 20.0 \text{ kip}/0.444 \text{ in} = 45.5 \text{ k/in}$$

Mass:

$$M = w/g = 20.0/386.4 = 0.05175 \text{ k-sec}^2\text{/in}$$

Frequency:

$$f = \frac{\sqrt{k / m}}{2\pi} = \frac{\sqrt{45.05 / 0.05175}}{2\pi} = 4.696\text{Hz}$$

Comparison

Table 583: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Frequency, *f* (Hz)	4.696	4.687	<1%

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\08 Dynamic Analysis\Natural Frequency of a 2D Truss.STD` is typically installed with the program.

V. Natural Frequency of Beam on Springs

Find the period of free vibration for a beam supported on two springs with a point mass.

Reference

Timoshenko, S., Young, D., and Weaver, W., *Vibration Problems in Engineering*, John Wiley & Sons, 4th edition, 1974. page 11, problem 1.1-3.

Problem

A simple beam is supported by two spring as shown in the figure. Neglecting the distributed mass of the beam, calculate the period of free vibration of the beam subjected to a load of W.

EI = 30,000.0 ksi

A = 7.0 ft

B = 3.0 ft.

W = 1,000 lbfK = 300.0 lb/in.

V. Rayleigh Natural Frequency of a Cantilever Beam

To calculate the Natural frequency of vibration using the Rayleigh method for a light cantilever beam with a mass at the free end.

Reference

Thomson, W.T., *Vibration Theory and Applications*, Prentice-Hall, Inc., 1965.

Problem

Find the natural frequency of vibration, f, of a mass, m, attached to the end of a light cantilever beam of length, L, and flexural stiffness, EI.

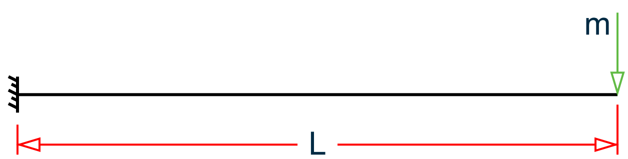

Figure 492: Model for dynamic beam no. 2

E = 30,000 ksi

I = 1.3333 in^4

m = 0.1 lb-sec^2/in

L = 30 in

V. Steady State Loading on a Beam

Calculate the deflections at two points along the beam at steady-state condition.

Reference

1. Blevins, R. D., *Formulas for natural Frequency and Mode Shape*, Van Nostrand Reinhold, 1979, pp. 108, 455-486.
2. Warburton, G. B., *The Dynamical Behavior of Structures*, Pergamon Press, 1964, pp. 10-15, 85, 86.

Problem

Determine the steady-state displacements of the quarter and mid-span points of a fixed-fixed beam subjected to a parabolically varying distributed load operating at a 7.5 Hz frequency.

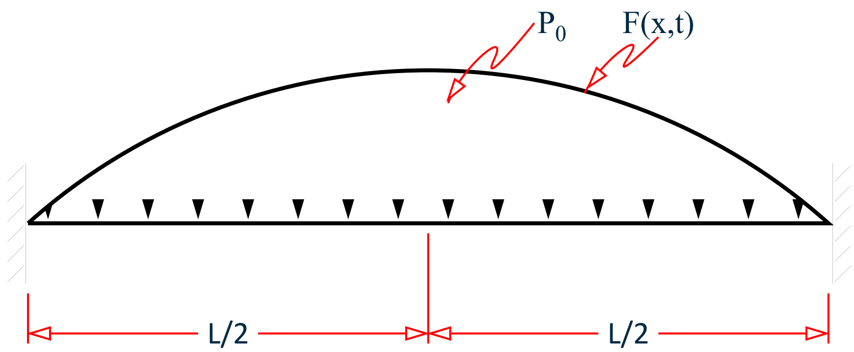

Figure 493: Beam with harmonic distributed load

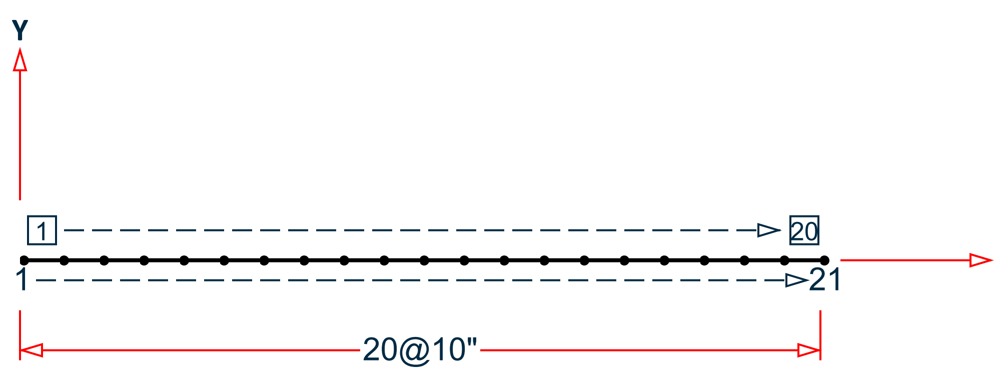

Figure 494: Model: divide span 20@10.0”

$E = 10.0\text{x}10^6$ psi

L = 200 inches

I = 2/3 in^4

A = 2 in^2

P_o = 0.1 lbf/in^3

g = 386.4 in/sec^2

The DYNRE2 run utilizes all 19 modes calculated by STAAD (Steady State analysis) for which a value of $1.0(10)^{-10}$ times critical damping is assigned. A single forcing frequency equal to 7.5 Hz is specified for the distributed load. This load is distributed to the nodes by calculating the total integrated load for each beam and lumping one-half of this force to the respective i and j nodes.

$$F_i = F_j = \int_{x_i}^{x_j} \frac{P(x)}{2}\, d\, x = \frac{1}{2}\int_{x_i}^{x_j} \frac{4}{l^2}\left(xl - x^2\right) d\, x$$

$$F_i = F_j = \left| \frac{x^2}{l} - \frac{2x^3}{3l^2} \right|_{x_i}^{x_j} = \frac{x_j^2 - x_i^2}{200} - \frac{x_j^3 - x_i^3}{60,\ 000}$$

Theoretical Solution

The theoretical solution for this example is taken from:

1. Blevins, R. D., “Formulas for natural Frequency and Mode Shape,” Van Nostrand Reinhold, 1979, pp 108, 455-486.
2. Warburton, G. B., “The Dynamical Behavior of Structures,” Pergamon Press, 1964, pp. 10-15, 85, 86.

The natural frequencies of the system are calculated using the equations from reference 1 page 108 and reference 2 page 85.

$$f_i = \frac{\lambda_1^2}{2\pi l^2}\sqrt{\frac{EI}{m}}$$

where

$$m = \rho A/g$$

$$f_i = \frac{\lambda_i^2}{2\pi(200)^2}\sqrt{\frac{1.0(10)^6\left(2/3\right)}{0.10(2.0/386.4)}}$$

$$= 4.5156271*10^{-1}\lambda_i^{\ 2}$$

$\lambda_i$satisfies the characteristic equation:

$$\cos\lambda \cosh\lambda - 1 = 0$$

Table 587: Calculated natural frequency for each mode

i	λ_i	ω_i	f_i
1	4.730041	63.47865	10.10294
2	7.853205	174.9814	27.84915
3	10.99561	343.0334	54.59546

i	λ_i	ω_i	f_i
4	14.13717	567.0517	90.24907
5	17.27876	847.0773	134.8165
6	20.42035	1183.108	188.2975
7	23.56194	1575.144	250.6919
8	26.70354	2023.185	321.9998

The mode shapes are:

$$\phi_i = \cosh\frac{\lambda_i x}{l} - \cos\frac{\lambda_i x}{l} - \sigma_i\left(\sinh\frac{\lambda_i x}{l} - \sin\frac{\lambda_i x}{l}\right)$$

Where:

$$\sigma_i = \frac{\cosh\lambda_i - \cos\lambda_i}{\sinh\lambda_i - \sin\lambda_i}$$

The response of mode i to a harmonic force:

$$\eta_i = \frac{\int_l \phi_i(x)P(x)\,d\,x}{\omega_i^2 \int\{\phi_i(x)\}^2 m\,d\,x} - \frac{\sin(\omega t - \psi_i)}{\sqrt{\left(1 - \frac{\omega^2}{\omega_i^2}\right)^2 + \left(\frac{c\omega}{k}\right)^2}}$$

Where ψ_i is the response phase lag relative to the applied force and c is the damping.

Since c = 0.0, $\psi_i = 0.0$

Upon substitution and rearranging terms:

$$\eta_i = \frac{\int_l \frac{4P_o}{l^2}\left(xl - x^2\right)\phi_i\left(x\right)\,d\,x}{\frac{\rho A}{g}\left(\omega_i^2 - \omega^2\right)\int_l\{\phi_i(x)\}^2\,d\,x}\sin\omega t$$

From reference 1, page 466, case c and page 467, case 29:

$$\frac{4P_o}{l^2}\int_l x\phi_i(x)\,d\,x - \frac{4P_o}{l^2}\int_l x^2\phi_i\left(x\right)\,d\,x = \frac{8P_0}{\beta_i^2 l}\left[1 + (-i)^i - (-i)^i\sigma_i\beta_i l\right] - \frac{8(-l)^i P_0}{\beta_i^2 l}\left[2 - \sigma_i\beta_i l\right]$$

Since the load is symmetric, this expression is zero for I = 2, 4, 6 ...;

Therefore, i = 1,3,5……, and: $(-1)^i = -1$

And from the reference, $\beta_i = \lambda_i / l$

So:

$$\int_l \phi_i(x)P(x)\,d\,x = \frac{16P_o l}{\lambda_i^2}$$

From Reference 1, page 457 case 5:

$$\int_l \{\phi_i(x)\}^2 \, d \; x = 1$$

Therefore:

$$\omega = 7.5(2\pi) = 47.1239 \text{ radians/sec}$$

$$\eta_i = \frac{16P_o}{m\lambda_i^2\left(\omega_i^2 - \omega^2\right)} \sin \omega t = \frac{16(-1.0)\sin \omega t}{\frac{0.10(2)}{386.4}\lambda_i^2\left(\omega_i^2 - 2,\ 220.661\right)} = \frac{30,\ 912 \cdot \sin \omega t}{\lambda_i^2\left(\omega_i^2 - 2,\ 220.661\right)}$$

Table 588: Mode shapes

i	λ_i	ω_i	$\eta_i(t)$	σ_i	φ(1/4)	φ(1/2)
1	4.730041	63.47865	$-7.63815(10)^{-1} \sin \omega t$	0.9825022	0.8631319	1.5881463

V. Steady State - With Damping

Determine amplitude of motion of a beam due to harmonic force.

Reference

Paz, Mario. 1985. *Structural Dynamics Theory and Computation. 2nd Edition*. New York, NY:Van Nostrand Reinhold. pp54-55, Example 3.5

Problem

A 10' long, simply-supported beam simulating a damped oscillator.

Material modulus of elasticity, $E = 30{,}000\ ksi$
Section moment of inertia, $I_z = 120\ in^4$
Weight applied at mid-span, $F_y = 3.86\ kips$

A steady state analysis is performed for the harmonic forcing function $7000\ sin\ 60t$ with the forcing frequency = $\omega = 60\ rad/sec = 9.5493\ cyc/sec$ & the magnitude = $7000\ lb = 7\ kip$ applied at the midpoint of the beam. Damping is considered for this problem and the value of 0.1 is specified.

Comparison

Result	Reference	STAAD.Pro	Difference	Comments
Steady State Amplitude (in)	0.1075	0.10749	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\08 Dynamic Analysis\Steady State - With Damping.std` is typically installed with the program.

V. Time History - Blast Loading

Determine the dynamic response of a tower subjected to blast loading.

Reference

Paz, Mario. 1985. *Structural Dynamics Theory and Computation. 2nd Edition*. New York, NY:Van Nostrand Reinhold. pp72-74

Problem

Material modulus of elasticity (assumed steel), $E = 29{,}000\ ksi$ and Poisson's ratio, $\nu = 0.3$
Length (assumed) = 10 ft
Section moment of inertia, $I_z = 1{,}986.4\ in^4$ (given $K = 100\ kip/in$, rearrange $K = 3EI/L^3$ to solve for $I = KEL^3/3$
Horizontal weight applied at top of 10' tower, $F_x = 38.6\ kips$

V. Time History - Ground Acceleration

Determine the response of a two-story portal frame subjected to suddenly applied constant acceleration of 0.28 g at its base.

Reference

Paz, Mario. 1985. *Structural Dynamics Theory and Computation. 2nd Edition*. New York, NY:Van Nostrand Reinhold. pp196-201, 213, & 217-219.

Problem

Material modulus of elasticity, $E = 30,000\ ksi$ and Poisson's ratio, $\nu = 0.3$
Section moment of inertia, $I_{z1} = 248.6\ in^4$, $I_{z2} = 106.3\ in^4$
Mass at first story above ground, $F_x = 52.5\ kips$, at roof story $F_x = 25.5\ kips$
Constant ground acceleration = $0.28g = 9.03917\ ft/sec^2$

The ground acceleration is applied as a time vs. acceleration function with the data pairs supplied up to $t = 2\ sec$.

Comparison

V. Time History - Rectangular Pulse Force

Determine the maximum displacement at the top and maximum bending stress in the columns of a one-story portal frame subject to a rectangular pulse force.

Reference

Chopra, Anil K. 1995. *Dynamics of Structures: Theory and Applications to Earthquake Engineering*. Upper Saddle River, NJ:Prentice Hall, Example 4.1, p 136.

Problem

From the reference:

> A one-story building, idealized as a 12-ft high frame with two columns hinged at the base and a rigid beam, has a natural period of 0.5 sec. Each column is an America standard wide-flange steel section W8x18. Its properties for bending about its major axis are $I_x = 61.9\ in^4$, $S = I_x/c = 15.2\ in^3$; $E = 30{,}000\ ksi$. Neglecting damping, determine the maximum response of this frame due to a rectangular pulse force of amplitude 4 kips and duration $t_d = 0.2\ sec$. The response quantities of interest are displacement at the top of the frame and maximum bending stress in the columns.

The following time vs. force function is applied for the rectangular pulse force:

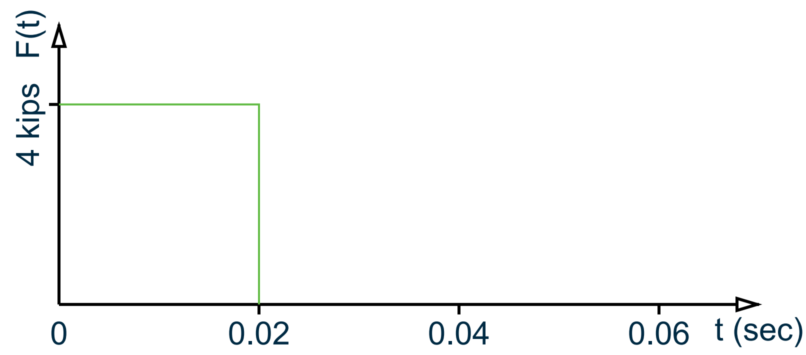

Figure 497: Rectangular pulse force

Calculations

The natural frequency of the structure is:

$$\omega_n = 2\pi/T_n = 2\pi/0.5 = 12.57 \text{ rad/sec.}$$

Also, the lateral stiffness of the frame:

$$k = 2\frac{3EI}{L^3} = 2\frac{3 \times 30{,}000 \times 61.9}{12 \times 12^3} = 3.73 \text{ kips/in}$$

Solving $\omega_n = \sqrt{\frac{k}{m}}$ for m, $m = \frac{k}{\omega_n^2} = \frac{3.73 \times 10^3}{12.57^2} = 23.62\ lbs$.

Thus, the force applied at the top of the frame as the mass load is $W = m \times g = 23.62\ lbs \times 32.2\ ft/s^2 \times 12\ in/ft = 9{,}122\ lbs\text{-}force = 9.122\ kips$.

Comparison

Result	Reference	STAAD.Pro	Difference	Comments
Max. dynamic deformation (in)	2.04	2.03965	negligible	
Max. bending moment (kip·in)	547.8	547.98	negligible	
Max. bending stress (ksi)	36.04	36.0	negligible	

Modeling notes:

- A new material with the modulus of elasticity specified is used in place of the built-in steel material.
- For the generation of the STAAD.Pro model, the cross-section of the beam is take as 6" × 6" and the cross-section properties are assigned using a user-provided table for prismatic shapes. A massive (10^6 ft^4) moment of inertia about local z and y axes is specified to approximate an infinitely rigid beam.
- Pinned supports are supplied at the base of each column. A fixed-but allowing only translation along the global X axis is assigned to the tops of the columns / beam ends.
- As STAAD.Pro defaults to a damping ratio of 0.05 if no arrival time is specified (i.e., an arrival time of $t = 0$ seconds), a negligible damping of $1.1 \times (10)^{-6}$ is assigned.

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\08 Dynamic Analysis\Time History - Rectangular Pulse Force.STD` is typically installed with the program.

V.09 Steel Design

V. Australia

V. AS4100 1998 - Bending Capacity

To check the bending capacity of the UB shape per AS4100-1998.

Reference

Gorenc,B., R.Tinyou and A.Syam, *Steel Designer's Handbook*, 8th edition, UNSW Press,

problem 5.3, page 112.

Related Links

- *D2.B. Australian Codes - Steel Design per AS 4100 - 1998* (on page 1356)

Problem

Check the suitability of a 360UB50.7 Grade 300 for the beam in Example 5.2 of the reference. This solution relies mainly on AS 4100 and minimally on AISC [1999a], for example, to get basic section properties. Omit deflection checks.

Comparison

Table 591: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Bending capacity, Mnz (kN·m)	138	137.5	0.3%
Bending moment (kN·m)	125	124.7	0.2%
Utilization ratio	0.906	0.907	0.1%

The reference book does not compute the ratio.

STAAD Input

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Australia\AS4100 1998 - Bending Capacity.STD` is typically installed with the program.

V. AS4100 1998 - Bending Capacity for Non-compact Section

Verify the bending capacity for a non-compact section per AS4100-1998.

Given

The member is 8 m long simply-supported beam. The section is a 900WB218. The member is subject to major axis bending due to uniform dead load of 4.17 kN/m and live load of 8 kN/m as well as concentrated dead load of 104 kN and live load of 140 kN at mid-span.

<u>Section Properties</u>

Overall depth of section, $D = 910\ mm$
Width of section, $B = 350\ mm$
Thickness of web, $t_w = 12\ mm$
Thickness of flange, $t_f = 25\ mm$
Area, $A_g = 27{,}800\ mm^2$
Moment of inertia about major axis, $I_{zz} = 4{,}060\ (10)^6\ mm^4$
Moment of inertia about minor axis, $I_{yy} = 179\ (10)^6\ mm^4$
Elastic section modulus about major axis, $Z_{xx} = 8.92\ (10)^6\ mm^3$
Elastic section modulus about minor axis, $Z_{yy} = 1.02\ (10)^6\ mm^3$
Plastic section modulus about major axis, $S_{xx} = 9.96\ (10)^6\ mm^3$
Plastic section modulus about minor axis, $S_{yy} = 1.56\ (10)^6\ mm^3$
Torsion constant, $J = 4.02\ (10)^6\ mm^4$
Warping moment, $I_w = 35.05\ (10)^{12}\ mm^4$
Radius of gyration, $r_x = \sqrt{I_{zz}/A} = 382.2\ mm$
Radius of gyration, $r_y = \sqrt{I_{yy}/A} = 80.2\ mm$

<u>Material Properties</u>

$E = 200{,}000\ MPa$
$G = 80{,}000\ MPa$
$f_y = 360\ MPa$ (flange); $f_y = 400\ MPa$ (web)

Validation

Section Slenderness Check

$$\frac{b}{2} = \frac{(350 - 12)}{2} = 169 \text{ mm}$$

Flange section slenderness parameter, $\lambda_{ef} = \frac{b}{t_f}\sqrt{\frac{f_y}{250}} = \frac{169}{25}\sqrt{\frac{360}{250}} = 8.112 > \lambda_{ep} = 8$, therefore the flange is non-compact.

$$d = D - 2\times t_f = 910 - 25\times 2 = 860 \text{ mm}$$

Web section slenderness parameter, $\lambda_{ew} = \frac{d}{t_w}\sqrt{\frac{f_y}{250}} = \frac{860}{12}\sqrt{\frac{400}{250}} = 90.65 > \lambda_{ep} = 82$, therefore the web is non-compact.

Section Bending Capacity Major AxisThe plastic section capacity, Z_{cx}, is the minimum of S_{xx} or $1.5\times Z_{xx} = 1.5(8.92 \times 10^6) = 13.38 \times 10^6 \ mm^3$; so $Z_{cx} = 9.96 \times 10^6 \ mm^3$.

From Table 5.2 of AS 4100, $\lambda_{ey} = 115$ and $\lambda_{ep} = 82$.

For sections where $\lambda_{ep} < \lambda < \lambda_{ey}$, the effective section modulus is calculated as:

$$Z_{ez} = Z_{xx} + \frac{\lambda_{ey} - \lambda_{ew}}{\lambda_{ey} - \lambda_{ep}}\left(Z_{cx} - Z_{xx}\right) = \left[8.92 + \frac{115 - 90.65}{115 - 82}\left(9.96 - 8.92\right)\right]10^6 = 9.69 \times 10^6 \text{ mm}^3$$

$$M_{sx} = Z_{ez} \times f_y = 9.69 \times 360 = 3{,}488 \text{ kN·m}$$

$$\phi M_{sx} = 0.9 \times 3{,}488 = 3{,}139 \text{ kN·m}$$

Section Bending Capacity Minor AxisThe plastic section capacity, Z_{cy} is the minimum of S_{yy} or $1.5\times Z_{yy} = 1.5(1.02 \times 10^6) = 1.53 \times 10^6 \ mm^3$; so $Z_{cy} = 1.53 \times 10^6 \ mm^3$.

For sections where $\lambda_{ep} < \lambda < \lambda_{ey}$, the effective section modulus is calculated as:

$$Z_{ey} = Z_{yy} + \frac{\lambda_{ey} - \lambda_{ew}}{\lambda_{ey} - \lambda_{ep}}\left(Z_{cy} - Z_{yy}\right) = \left[1.02 + \frac{115 - 90.65}{115 - 82}\left(1.53 - 1.02\right)\right]10^6 = 1.53 \times 10^6 \text{ mm}^3$$

$$M_{sy} = Z_{ey} \times f_y = 1.53 \times 360 = 552.4 \text{ kN·m}$$

$$\phi M_{sy} = 0.9 \times 552.4 = 497.1 \text{ kN·m}$$

Member Bending Capacity

Twist restraint factor,

$$k_t = 1 + \left(\frac{2 \times d}{l}\right)\left(\frac{0.5 \times t_f}{t_w}\right)^3 = 1 + \left(\frac{2 \times 860}{8000}\right)\left(\frac{0.5 \times 25}{12}\right)^3 = 1.24$$

From Table 5.6.3(2) of AS 4100, Load Height Factors, $k_l = 1.4$.

From Table 5.6.3(3) of AS 4100, Lateral Rotation Restraint Factors, $k_r = 1.0$.

Effective length of the member:

$$l_e = k_t k_l k_r l = 1.24 \times 1.4 \times 1.0 \times 8{,}000 = 13{,}900 \text{ mm}$$

$$M_o = \sqrt{A(B + C)} \qquad \text{(Eqn 5.6.1.1(3))}$$

where

$$A = \frac{\pi^2 E I_y}{l_e^2} = \frac{\pi^2 \times 200 \times 10^3 179 \times 10^6}{(13{,}900)^2} = 1.829 \times 10^6 \ N$$

$$B = \frac{\pi^2 E I_w}{l_e^2} = \frac{\pi^2 \times 200 \times 10^3 35 \times 10^{12}}{(13{,}900)^2} = 357.6 \times 10^9 \ N \cdot mm^2$$

$$C = G \times J = 80 \times (10)^3 4.02 \times (10)^6 = 321.6 \times (10)^9 \ N \cdot mm^2$$

$$M_o = \sqrt{1.829 \times (10)^6 \left[357.6 \times 10^9 + 321.6 \times (10)^9\right]} = 1{,}116 \times (10)^6 \text{ N}\cdot\text{mm} = 1{,}116 \text{ kN}\cdot\text{m}$$

The slenderness reduction factor is then:

$$a_s = 0.6\left[\sqrt{\frac{M_s^2}{M_o^2} + 3} - \frac{M_s}{M_o}\right] = 0.6\left[\sqrt{\frac{(3{,}488)^2}{(1{,}116)^2} + 3} - \frac{3{,}488}{1{,}116}\right] = 0.268 \quad \text{(Eqn. 5.6.1.1(2))}$$

The moment shape factor is then:

$$M_1 = M_3 = 436.8 \text{ kN}\cdot\text{m}$$

$$M_2 = M_{max} = 805.6 \text{ kN}\cdot\text{m}$$

$$a_m = \frac{1.7 M_{max}}{\sqrt{M_2^2 + M_3^2 + M_4^2}} = \frac{1.7 \times 805.6}{\sqrt{(436.8)^2 + (805.6)^2 + (436.8)^2}} = 1.35$$

The member moment capacity:

$$\phi M_b = \phi a_m a_s M_s = 0.9 \times 1.35 \times 0.268 \times 3{,}488 = 1{,}135 \text{ kN}\cdot\text{m} \quad \text{(Eqn 5.6.1.1(1))}$$

Comparison

Table 592: Comparison of results

Result Type	Theory	STAAD.Pro	Difference	Comment
Nominal section capacity major axis, M_{sx} (kN·m)	3,139	3,139	none	
Nominal section capacity major axis, M_{sy} (kN·m)	497.1	495.7831	negligible	
Member bending capacity, M_{bx} (kN·m)	1,135	1,134.4	negligible	

STAAD Input

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Australia\AS4100 1998 - Bending Capacity for Non-Compact section.std` is typically installed with the program.

The following design parameters are used:

- The steel grade of Fy = 350 MPa is given by `SGR 8` (AS/NZS 3678 400).
- The load height occuring at the top flange is specified by `LHT 1`.

V. AS4100 1998 - Cantilever subject to tension and bending

Verify the tension and out-of-plane bending capacities of an I section cantilever beam per the AS 4100 1998 code.

Details

The cantilevered member is 2 m in length. The section is a 250UC89.5 of grade 300 steel. The member is subject to 434 kN in tension.

Section Properties

Cross-sectional area, $A_g = 11,400\ mm^2$
Plastic section modulus, $S_{xx} = 1.23 \times 10^6\ mm^3$

Material Properties

E = 199,947 MPa
G = 80,000 MPa
$F_{y,web}$ = 300 MPa
$F_{y,flange}$ = 280 MPa
F_u = 440 MPa

Validation

Axial Tension Capacity

Gross yielding:

$$N_{ty} = A_g f_y = 11,400 \times 280(10)^{-3} = 3,190 \text{ kN}$$

Fracture:

Assume net area, A_n, is equal to the gross area.

K_t = correction factor for distribution of forces = 1.0

$$N_{tf} = 0.85 K_t A_n f_u = 0.85 \times 1.0 \times 11,400 \times 440(10)^{-3} = 4,264 \text{ kN}$$

N_t is the lesser of N_{ty} and N_{tf}, $N_t = 3,190\ kN$

$$\phi N_t = 0.9 \times 3,190 = 2,870 \text{ kN}$$

Section Bending Capacity

$$M_{sx} = S_x f_y = 1.23(10)^6 280 = 344 \text{ kN·m}$$

$$\phi M_{sx} = 0.9 \times 344 = 310 \text{ kN·m}$$

Axial tensile load, N, mitigating flexural-torsional buckling:

$$M_{ox} = M_{bx} \times \left(1 + \frac{N}{\phi N_t}\right) = 336\left(1 + \frac{434}{2{,}870}\right) = 387 \text{ kN·m}$$

$$\phi M_{ox} = 0.9 \times 387 = 348 \text{ kN·m}$$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
Axial tension capacity (kN)	2,870	2,872	negligible	
Member combined out-of-plane bending and tension (kN·m)	310	309.96	negligible

   DESIGN Notes
   ------------
   1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for
      that particular Load Case; i.e. analysis does not include second-order
effects.
   2. φ = 0.9 for all the calculations [AS4100 Table 3.4]
   3. (#) next to Young's modulus E indicates that its value is not 200000
MPa as per AS4100 1.4.

V. AS4100 1998 - Combined Section and Member In-Plane Capacity

Verify the bending capacity in major and minor axis bending, biaxial bending, and in-plane bending for a UC member subject an axial load per AS4100-1998.

Given

The member is 7 m long and part of a steel frame structure. The section is a 200UC52.2. The member is subject to an axial load of 143.9 kN.

Section Properties

Depth of section, $D = 206\ mm$
Width of section, $B = 204\ mm$
Thickness of web, $t_w = 8\ mm$
Thickness of flange, $t_f = 12.5\ mm$
Area, $A_g = 6{,}660\ mm^2$
Moment of inertia about major axis, $I_{zz} = 52.8\ (10)^6\ mm^4$
Moment of inertia about minor axis, $I_{yy} = 17.7\ (10)^6\ mm^4$
Elastic section modulus about major axis, $Z_{xx} = 513\ (10)^3\ mm^3$
Elastic section modulus about minor axis, $Z_{yy} = 174\ (10)^3\ mm^3$

Plastic section modulus about major axis, $S_{xx} = 570\ (10)^3\ mm^3$
Plastic section modulus about minor axis, $S_{yy} = 264\ (10)^3\ mm^3$
Radius of gyration, $r_x = \sqrt{I_{zz}/A} = 89.0\ mm$
Radius of gyration, $r_y = \sqrt{I_{yy}/A} = 51.6\ mm$

Material Properties

$f_y = 300\ MPa$ (flange); $f_y = 320\ MPa$ (web)

Validation

Combined Major Axis Section Moment Capacity

Nominal axial capacity: $\phi N_s = 0.9 \times 6.66 \times 300 = 1,798\ kN$

Nominal section capacity: $\phi M_{sx} = 0.9 \times 570 \times 300 = 153.9\ kN{\cdot}m$

The section is compact, so the alternate method is applicable.

$$\phi M_{\text{rx}} = \phi 1.18 M_{\text{sx}}\left(1 - \frac{N}{\phi N_s}\right) \le \phi M_{\text{sx}}$$

$$\phi M_{\text{rx}} = 1.18 \times 153.9\left(1 - \frac{143.9}{1{,}798}\right) = 167.1\ \text{kN}{\cdot}\text{m} > \phi M_{\text{sx}}$$

$$\phi M_{\text{rx}} = \phi M_{\text{sx}} = 153.9\ \text{kN}{\cdot}\text{m}$$

Combined Minor Axis Section Moment Capacity

Nominal section capacity: $\phi M_{sy} = \phi S_{yy} F_y \le \phi 1.5 Z_{yy} F_y$

$$\phi M_{\text{sy}} = 0.9 \times 264 \times 300 = 71.3\ \text{kN}{\cdot}\text{m} > 0.9 \times 1.5 \times 174 \times 300 = 70.5\ \text{kN}{\cdot}\text{m}$$

The section is compact, so the alternate method is applicable.

$$\phi M_{\text{ry}} = \phi 1.19 M_{\text{sy}}\left(1 - \frac{N}{\phi N_s}\right)^2 \le \phi M_{\text{sy}}$$

$$\phi M_{\text{ry}} = 1.19 \times 70.5\left(1 - \frac{143.9}{1{,}798}\right)^2 = 71.0\ \text{kN}{\cdot}\text{m} > \phi M_{\text{sy}}$$

$$\phi M_{\text{ry}} = \phi M_{\text{sy}} = 70.5\ \text{kN}{\cdot}\text{m}$$

Member In-plane Capacity Check

The section is compact, so the alternate method is applicable. The larger end moment = $111.1\ kN{\cdot}m$ and the smaller end moment = $108.1\ kN{\cdot}m$.

$$\beta_{\text{mx}} = \frac{108.1}{111.1} = 0.973$$

$$\phi M_{\text{ix}} = \phi M_s\left\{\left[1 - \left(\frac{1 + \beta_m}{2}\right)^3\right]\left(1 - \frac{N}{\phi N_c}\right) + 1.18\left(1 + \frac{1 + \beta_m}{2}\right)^3\sqrt{\left(1 - \frac{N}{\phi N_c}\right)}\right\} \le \phi M_{\text{rx}}$$

$$\phi M_{\text{ix}} = 153.9\left\{\left[1 - \left(\frac{1 + 0.973}{2}\right)^3\right]\left(1 - \frac{143.9}{1{,}146}\right) + 1.18\left(1 + \frac{1 + 0.973}{2}\right)^3\sqrt{\left(1 - \frac{143.9}{1{,}146}\right)}\right\} = 168.4\ \text{kN}{\cdot}\text{m} > \phi M_{\text{rx}}$$

$$\phi M_{\text{ix}} = \phi M_{\text{rx}} = 153.9\ \text{kN}{\cdot}\text{m}$$

Comparison

   DESIGN Notes
   ------------
   1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for
      that particular Load Case; i.e. analysis does not include second-order
effects.
   2. φ = 0.9 for all the calculations [AS4100 Table 3.4]
   3. (#) next to Young's modulus E indicates that its value is not 200000
MPa as per AS4100 1.4.

V. AS4100 1998 - Compression Capacity

Verify the capacity of a tubular compression member subjected to axial load only per AS4100-1998.

Given

The member 3.8 m long with pinned ends (no end moments). The section is a 219.1x6.4CHS. The member is subject to an axial load of 1,030 kN.

Section Properties

Depth of section, $d = 219.1\ mm$

Thickness, $t = 6.4\ mm$
Area, $A_g = 4{,}280\ mm^2$
Moment of inertia about major axis, $I_{zz} = 22.2\ (10)^6\ mm^4$
Radius of gyration, $r_x = \sqrt{I_{zz}/A} = 75.2\ mm$

Material Properties

$F_y = 350\ MPa$

Validation

Nominal Section Capacity Check

$$\lambda_e = \left(\frac{d_o}{t}\right)\left(\frac{F_y}{250}\right) = \frac{219.1}{6.5} \times \frac{350}{250} = 47.9$$

$$\lambda_{ey} = 82$$

$$d_{e1} = d_0\sqrt{\frac{\lambda_{ey}}{\lambda_e}} = 219.1\sqrt{\frac{82}{47.9}} = 287 \le d_o = 219.1 \text{ mm}$$

$$d_{e1} = d_0\left(\frac{3 \times \lambda_{ey}}{\lambda_e}\right)^2 = 219.1\left(\frac{3 \times 82}{47.9}\right)^2 = 5{,}780 \text{ mm}$$

The effective depth is the minimum of d_{e1} and d_{e2}, or $219.1\ mm$.

$$d_i = d_e - 2 \times t = 219.1 - 2(6.4) = 206.3 \text{ mm}$$

The effective area,

$$A_e = \frac{\pi {d_e}^2}{4} - \frac{\pi {d_i}^2}{4} = \frac{\pi(219.1)^2}{4} - \frac{\pi(206.3)^2}{4} = 4{,}280 \text{ mm}^2$$

$$K_f = \frac{A_e}{A_g} = \frac{4{,}280}{4{,}280} = 1$$

Net area = $4{,}280\ mm^2$

Nominal section capacity:

$$N_s = K_f \times A_n \times F_y = 1 \times 4{,}280 \times 350(10)^{-3} = 1{,}500 \text{ kN}$$

$$\phi N_s = 0.9 \times 1{,}500 = 1{,}350 \text{ kN}$$

Axial Member Capacity

The effective length for the member pinned at both ends:

$$l_e = K_e \times L = 1 \times 3{,}800 = 3{,}800 \text{ mm}$$

$$\frac{l_e}{r_x} = \frac{3{,}800}{75.2} = 50.5$$

Modified slenderness ratio:

$$\lambda_n = \frac{l_e}{r_x}\sqrt{\frac{K_f F_y}{250}} = 50.5\sqrt{\frac{1 \times 350}{250}} = 59.8$$

The member section has a constant a_b. The residual stress for cold-formed (non-stress relieved) CHS category. Kf = 1. Therefore, from AS 4100 table 6.3.3(1), $a_b = -0.5$.

From interpolating Table 6.6 or AS 4100 Table 6.3.3(3), the slenderness reduction factor, $a_c = 0.863$.

$$N_c = \alpha_c \times N_s = 0.863 \times 1{,}500 = 1{,}290 \text{ kN}$$

$$N_c < N_s, \text{ OK}$$

$$\phi N_c = 0.9 \times 1{,}290 = 1{,}160 \text{ kN}$$

Comparison

Table 594: Comparison of results

Result Type	Theory	STAAD.Pro	Difference	Comment
Nominal section capacity (kN)	1,350	1,348.2	negligible	
Axial member capacity (kN)	1,160	1,163	negligible	

STAAD Input

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Australia\AS4100 1998 - Compression Capacity.STD` is typically installed with the program.

   DESIGN Notes
   ------------
   1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for
      that particular Load Case; i.e. analysis does not include second-order
effects.
   2. φ = 0.9 for all the calculations [AS4100 Table 3.4]
   3. (#) next to Young's modulus E indicates that its value is not 200000
MPa as per AS4100 1.4.

V. AS4100 1998 - SHS section subject to compression

Verify the axial compression capacities of an SHS section beam per the AS 4100 1998 code.

Details

The member is 3.8 m in length, with pinned supports at both ends. The section is a 200 x 200 x 5.0 SHS of grade 250 steel. The member is subject to 1,030 kN in compression.

Section Properties

Depth of section, $b = d = 200\ mm$
Thickness, $t = 5\ mm$
Cross-sectional area, $A_g = 3{,}810\ mm^2$
Radius of gyration, $r_x = 79.2\ mm$

Material Properties

E = 199,947 MPa
G = 80,000 MPa
F_y = 250 MPa
F_u = 320 MPa

Validation

Nominal Section Capacity

Clear width: $b_{cw} = b - 2t = 200 - 2\times5 = 190\ mm$

$$\lambda_e = \frac{b_{\mathrm{cw}}}{t}\sqrt{\frac{f_y}{250}} = \frac{190}{5}\sqrt{\frac{250}{250}} = 38$$

$$\lambda_{\mathrm{ey}} = 40$$

Effective width, b_e, for each compression element:

$$b_e = b_{cw}\sqrt{\frac{\lambda_{ey}}{\lambda_e}} \leq b_{cw} = 190\sqrt{\frac{40}{38}} = 195 > 190$$

Use $b_e = 190\ mm$

Effective area, $A_e = 4 \times b_e \times t = 4 \times 190 \times 5 = 3{,}800\ mm^2$

$$K_f = \frac{A_e}{A_g} = \frac{3{,}800}{3{,}810} = 1.0$$

Assume the net area, A_n, is equal to the gross area (i.e., no holes).

The nominal section capacity:

$$N_s = K_f A_n f_y = 1.0 \times 3{,}800 \times 250(10)^{-3} = 950 \text{ kN}$$

$$\phi N_s = 0.9 \times 950 = 855 \text{ kN}$$

<u>Axial Member Capacity</u>

The effective length, $l_e = K_e \times L = 1 \times 3{,}800\ mm = 3{,}800\ mm$

The modified slenderness ratio:

$$\lambda_n = \frac{l_e}{r}\sqrt{\frac{K_f f_y}{250}} = \frac{3{,}800}{79.2}\sqrt{\frac{1 \times 250}{250}} = 47.97$$

Member section constant, a_b, for shape of section, residual stress cold-formed (non-stress relieved) CHS category, and $K_f = 1.0$ from AS 4100 Table 6.3.3.(2): $a_b = -0.5$.

From linear interpolation of Table 6.3.3(3), the slenderness reduction factor, $a_c = 0.913$.

$$N_c = a_c N_s = 0.913 \times 950 = 867.4 \text{ kN}$$

$$\phi N_c = 0.9 \times 867.4 = 780.6 \text{ kN}$$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
Nominal section capacity (kN)	855	857.2499	negligible	
Axial member capacity (kN)	780.6	782.7	negligible

   DESIGN Notes
   ------------
   1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for
      that particular Load Case; i.e. analysis does not include second-order
effects.
   2. φ = 0.9 for all the calculations [AS4100 Table 3.4]
   3. (#) next to Young's modulus E indicates that its value is not 200000
MPa as per AS4100 1.4.

V. AS4100 1998 - Single Angle Section in Tension

To check the tensile capacity of a single angle per AS4100-1998.

Reference

Gorenc,B., R.Tinyou and A.Syam, *Steel Designer's Handbook*, 8th edition, UNSW Press, problem 7.2, page 198.

Related Links

- *D2.B. Australian Codes - Steel Design per AS 4100 - 1998* (on page 1356)

Problem

Select a section for a diagonal member of a truss. Verify its capacity. Use on equal leg angle in Grade 300 steel with one line of M20/S fasteners in one leg. Axial load of 300 kN is applied.

Comparison

Table 595: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Applied tensile load (kN)	300	300.3	0.1%
Tensile capacity, 0.9×Nt (kN)	492	492	none
Ratio	0.610	0.610	none

V. AS4100 1998 - Welded section subject to bending

Verify the bending capacity of a welded girder per the AS 4100 1998 code.

Details

The member is 21 m in length, with pinned supports at both ends. The section has top & bottom flanges of 450 mm × 60 mm and a web of 1,390 mm × 32 mm. The plates are all grade 280 steel. The member is subject to major axis bending. The section is partially restrained at the supports and at the third points along the span. The point loads are applied at the top flange.

Material Properties

E = 199,947 MPa
G = 80,000 MPa
F_y = 280 MPa
F_u = 440 MPa

Validation

Section Properties

Depth of section, $D = 1{,}390 + 2 \times 60 = 1{,}510\ mm$
Cross-sectional area, $A_g = 1{,}390 \times 32 + 2 \times 450 \times 60 = 98{,}480\ mm^2$
Moment of inertia about major axis:

$$I_{zz} = 2\left[\frac{b_f {t_f}^3}{12} + b_f t_f \left(\frac{d_w + t_f}{2}\right)^2\right] + \frac{t_w {d_w}^3}{12} = 2\left[\frac{450(60)^3}{12} + 450 \times 60\left(\frac{1{,}390 + 60}{2}\right)^2\right] + \frac{32(1{,}390)^3}{12} = 35.6(10)^9\ \mathrm{mm}$$

Moment of inertia about minor axis:

$$I_{yy} = \frac{d_w {t_w}^3}{12} + 2\frac{t_f {b_f}^3}{12} = \frac{1{,}390 \times (32)^3}{12} + 2\frac{60(450)^3}{12} = 915(10)^6\ \mathrm{mm}^4$$

Elastic section modulus, $Z_{xx} = \frac{I_{xx}}{D/2} = \frac{35.6(10)^9}{1{,}510 / 2} = 47.1(10)^6\ mm^3$

Plastic section modulus,

$$S_{xx} = 2\left[\frac{{d_w}^2 t_w}{8} + b_f t_f \left(\frac{d_w - t_f}{2}\right)\right] = 2\left[\frac{(1{,}390)^2 32}{8} + 450 \times 60\left(\frac{1{,}390 - 60}{2}\right)\right] = 54.6(10)^6\ \mathrm{mm}^3$$

Warping constant:

$$I_w = \frac{I_y (d_w + t_f)^2}{4} = \frac{915(10)^6 (1{,}390 + 60)^2}{4} = 481(10)^{12}\ \mathrm{mm}^6$$

Torsional constant:

$$J = \frac{2 b_f {t_f}^3 + d_w {t_w}^3}{3} = \frac{2(450)(60)^3 + 1{,}390(32)^3}{3} = 80.0(10)^6\ \mathrm{mm}^4$$

Section Slenderness Ratio

Flange section slenderness parameter:

$$\frac{b}{2} = \frac{b_f - t_w}{2} = \frac{450 - 32}{2} = 209 \text{ mm}$$

$$\lambda_{ef} = \frac{b}{t_f}\sqrt{\frac{f_y}{250}} = \frac{209}{60}\sqrt{\frac{280}{250}} = 3.69 < \lambda_{ep} = 8$$

Hence, the flange is compact.

Web section slenderness parameter:

$$\lambda_{ew} = \frac{d_w}{t_w}\sqrt{\frac{f_y}{250}} = \frac{1{,}390}{32}\sqrt{\frac{280}{250}} = 46.0 < \lambda_{ep} = 82$$

Hence, the web is compact.

<u>Section Bending Capacity</u>

Z_{cx} is the lesser of S_{xx} and $1.5 \times Z_{xx} = 1.5(47.1 \times 10^6) = 70.7(10^6)$.

$$M_{sx} = Z_{cx} f_y = 54.6(10)^6 280(10)^{-6} = 15{,}290 \text{ kN·m}$$

$$\phi M_{sx} = 0.9 \times 15{,}290 = 13{,}760 \text{ kN·m}$$

<u>Member Bending Capacity</u>

The length between braced points, $l = 7{,}000$ *mm*

$$k_t = 1 + \left(\frac{2d}{l}\right)\left(\frac{0.5t_f}{t_w}\right)^3 = 1 + \left(\frac{2 \times 1{,}390}{7{,}000}\right)\left(\frac{0.5 \times 60}{32}\right)^3 = 1.33$$

Top flange load height position: $k_l = 1.4$. No lateral rotational restraint: $k_r = 1.0$.

The effective length, $l_e = k_t k_l k_r l = 1.33 \times 1.4 \times 1.0 \times 7{,}000 = 13{,}000$ *mm*.

The reference buckling moment:

$$M_o = \sqrt{\frac{\pi^2 EI_y}{l_e^2}\left[GJ + \frac{\pi^2 EI_w}{l_e^2}\right]} = \frac{3{,}800}{79.2}\sqrt{\frac{1 \times 250}{250}}$$

$$= \sqrt{\frac{\pi^2 \times 199{,}947 \times 915(10)^6}{(13{,}000)^2}\left[80{,}000 \times 80(10)^6 + \frac{\pi^2 \times 199{,}947 \times 481(10)^{12}}{(13{,}000)^2}\right]}(10)^{-6} = 11{,}330 \text{ kN·m}$$

The moment modification factor:

$$a_m = \frac{1.7M_m}{\sqrt{(M_2)^2 + (M_3)^2 + (M_4)^2}}$$

where

M_M	=	the maximum design moment in the segment, = $M_3 = 6{,}142.5$ *kN·m* (from STAAD.Pro analysis)
$M_2, = M_4$	=	the design moment at the quarter points in the segment, = $5{,}862.5$ *kN·m* (from STAAD.Pro analysis)

$$a_m = \frac{1.7 \times 6{,}142.5}{\sqrt{2 \times (5{,}862.5)^2 + (6{,}142.5)^2}} = 1.012$$

The slenderness reduction factor per AS 4100 Eq. 5.6.1.1(2):

$$a_s = 0.6\left[\sqrt{\frac{{M_s}^2}{{M_o}^2} + 3} - \frac{M_s}{M_o}\right] = 0.6\left[\sqrt{\frac{(15{,}290)^2}{(11{,}330)^2} + 3} - \frac{15{,}290}{11{,}330}\right] = 0.508$$

$$\phi M_b = \phi a_m a_s M_s = 0.9 \times 1.012 \times 0.508 \times 15{,}290 = 7{,}074 \text{ kN·m}$$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
Nominal section capacity major axis, M_{sx}(kN·m)	13,760	13,760.9	negligible	
Member bending capacity, M_{bx} (kN·m)	7,074	7,072	negligible

   ------------
   1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for
      that particular Load Case; i.e. analysis does not include second-order
effects.
   2. φ = 0.9 for all the calculations [AS4100 Table 3.4]
   3. (#) next to Young's modulus E indicates that its value is not 200000
MPa as per AS4100 1.4.

V. CSA S16-01 - Axial Tension

Design of a double-angle member subject to tension load.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 3.1

Related Links

- *D4.B. Canadian Codes - Steel Design per CSA Standard CAN/CSA-S16-01* (on page 1419)

Problem

Design a tension diagonal in an all-welded truss. Attached to WT 265x61.5 chords (t_w = 13.1 mm).

$L = 4$ m

$T_f = 630$ kN

The material used is G40.21 300W steel (F_y = 300 MPa, F_u = 450 MPa) (FYLD and FU)

Calculations

Gross area is used for welded connections.

$$T_r = \max \begin{cases} \phi A F_y = 0.9 \times 300 \times A = 270A \\ \phi_u A F_u = 0.75 \times 450 \times A = 338A \end{cases}$$

$T_r \geq T_f$, so solve for A:

$$A = \frac{630 \times (10)^3}{270} = 2,\ 333\text{mm}^2$$

Select a pair of angles with at least this gross area: try a 2- 76x64x9.5, with long legs back-to-back:

$A = 2{,}480\ \text{mm}^2$

$r_{min} = 13.3$ mm

Calculate the effective net area due to shear lag. The average weld length is taken as *(120 mm + 250 mm)/2 = 185 mm*.

The long leg does not have a reduction in area shear lag, thus:

$A_{n2} = 1.00\times(76 - 9.5) \times 9.5 = 632\ \text{mm}^2$

The outstanding (short) leg has an eccentricity of half the leg length, or *64/2 = 32 mm*.

$$A_{n3} = \left(1 - \frac{32}{250}\right) \times 64 \times 9.5 = 530\text{mm}^2$$

The total net area for the pair of angles for the rupture limit state is:

$A_{ne} = 632 + 530 = 1{,}162\ \text{mm}^2$

For the pair of angles, $A_{ne} = 2\times1{,}1162 = 2{,}324\ mm^2$; the ratio of net section area to gross area = 2,324 / 2,480 = 0.937 (NSF).

Checking the yielding limit state:

$T_r = 0.90\times2{,}480\times300 = 670$ kN

Checking the rupture limit state:

$T_r = 0.75\times2{,}324\times450 = 784$ kN

Yielding governs, and the critical ratio is: *630/670 = 0.94*.

Comparison

Table 596: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
T_f (kN)	670	669.6	negligible
Critical Ratio	0.94	0.941	negligible

Note: If the member SELECT facility is used in place of a code CHECK, STAAD.Pro will actually select a 2-L 102x89x6.4 member, which has a critical ratio of 0.997 (per Cl. 13.2) and an area of 2,340 mm^2, thus more economical (the NSF used for this size is 0.923).

V. CSA S16-01 - Beam Shear Capacity

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 5.3

Related Links

- *D4.B. Canadian Codes - Steel Design per CSA Standard CAN/CSA-S16-01* (on page 1419)

Problem

The W530x82 beam has a maximum shear force, $v = 540\ kN$ due to factored loads.

$$L = 11.0 \text{ m}$$

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (`FYLD`)

Calculations

Evaluate the slenderness effects of the beam web:

$$\frac{h}{w} = \frac{528 - 2(13.3)}{9.5} = 52.8 < 439\sqrt{\frac{k_v}{F_y}} = 439\sqrt{\frac{5.34}{350}} = 54.2$$

Therefore the shear capacity is calculated as:

$$V_r = \phi \times A_w \times F_y = 0.9 \times 528 \times 9.5 \times 350 = 1{,}043 \text{ kN}$$

Calculate Equivalent Concentrated Load

The given end moments and assumed distributed loads (which was determined to given an equivalent mid-span moment of the given example) do not result in a shear force of 540 kN. Therefore, an additional concentrated load is added near the first support.

$$R_1 = \frac{w_f L}{2} + \frac{M_1 - M_2}{L} = \frac{40.17 \times 11.0}{2} + \frac{540 - 185}{11.0} = 253.2 \text{ kN}$$

$$P = 540 \text{ kN} - 253.2 \text{ kN} = 287 \text{ kN}$$

The STAAD.Pro will have this load applied at 1 mm away from the left support.

Comparison

Table 597: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
V_r (kN)	1,043	1,042.826	negligible

V. CSA S16-01 - Cantilever with Biaxial Loading

A slender, cantilever beam subjected to a uniform load. Static analysis, 3D beam element.

Reference

CISC Example 1, page 5-91, Limit State Design, CSA-S16.1-94

Related Links

- *D4.B. Canadian Codes - Steel Design per CSA Standard CAN/CSA-S16-01* (on page 1419)

Problem

A cantilever beam of length 4 meter is subjected to uniformly distributed load of 3 kN/Meter in both major and minor axis. Axial compression of 8 kN is also applied to the member. A user-defined steel section "Sect_Class-4" is assigned to the member.

Given

Design forces

8.0 kN (Compression)
6.0 kN·m (Bending-Y)
6.0 kN·m (Bending-Z)
6.0 kN (Shear-Y)
6.0 kN (Shear-Z)

Section Properties(Sect_Class-4):

Area = 2,766 mm^2
Depth of section, D = 150 mm
Thickness of web T_w = 7 mm
Width of flange B_f = 150 mm
Thickness of flange T_f = 6 mm
Moment of inertia about Z axis, $I_z = 10.87\times10^6$ mm^4
Moment of inertia about Y axis, $I_y = 3.38\times10^6$ mm^4
Moment of inertia about X axis, $I_x = 37.38\times10^3$ mm^4
Warping constant, $C_w = 17.52\times10^9$ mm^6
Torsion constant, $J = \frac{2B_f T_f^{\,3} + \left(D - T_f\right)t_w^{\,3}}{3} = \frac{2 \times 150 \times 6^3 + \left(150 - 6\right)7^3}{3} = 38.06 \times 10^3\ mm^4$

Member Length L = 2 m, Unbraced length = 100mm.

Material

Fy (FYLD) = 300 MPa
E = 205,000 MPa
G = 78,850 MPa

Calculations

Slenderness Ratio

Effective Length factor along Local Y-Axis = KY = 1

Effective Length factor along Local Z-Axis = KZ = 1

Slenderness ratio about Z axis, L/Rz = 31.9

Slenderness ratio about Y axis, L/Ry = 57.22

Maximum Slenderness Ratio, L/Rmax = 57.22

Section Classification

$$B_f / T_f = 150 \times 0.5 / 6 = 12.5 > \frac{200}{\sqrt{F_y}} = 11.54$$

Flange is Class 4.

$$d/T_w = (150 - 2.0\times6)/7 = 19.7$$

$$\frac{1{,}100}{\sqrt{F_y}}\left(1 - 0.39\frac{C_f}{\phi C_y}\right) = \frac{1{,}100}{\sqrt{300}}\left(1 - 0.39\frac{8{,}000}{0.9 \times 2{,}766 \times 300}\right) = 63.5$$

Web is Class 1.

Overall section is Class 4 section.

Check against axial compression (Clause 13.3.3)

Effective width, $B_{eff} = 200 \times \frac{T_f}{\sqrt{F_y}} = 69.24$

Effective area, $A_{eff} = 69.24 \times 6 \times 4 + (150 - 2 \times 6) \times 7 = 2{,}628\ mm^4$.

Effective yield stress, $F_{y,eff} = \frac{40{,}000}{(0.5 \times B_f\ /\ T_f)^4} = 256\ MPa$.

As per Clause 13.3.3(a),

Elastic critical buckling, Fe = $\pi^4\times$E/ L_Rmax^4 = 617.956 MPa.

Non-dimensional slenderness ratio, $\lambda = \sqrt{F_y / F_e} = 0.697$

Axial compressive resistance, $C_r = \phi A_{eff} \times F_y \times \left[1 + 0.697^{(2\times1.34)}\right]^{(-1/1.34)} = 557.9\ kN$.

As per Clause 13.3.3(b),

Elastic critical buckling, Fe = $\pi^4\times$E/ L_Rmax^4 = 617.956 MPa.

Effective non-dimensional slenderness ratio, $\lambda = \sqrt{F_y / F_e} = 0.697$

Axial compressive resistance, $C_r = \phi \times A \times F_{y,eff} \times \left[1 + 0.644^{(2\times1.34)}\right]^{(-1/1.34)} = 521.8\ kN$.

Axial compressive resistance = $min(557.9,\ 521.8) = 521.8\ kN$.

Check against bending (Clause 13.5(c))

As the web of the section meets the requirement of Class 3 and flange exceeds Class 3 limit, flexural resistance should be calculated as per clause 13.5(c).iii.

Effective moment of inertia about Z axis,

$$I_{z,eff} = 2 \times \left[\frac{2 \times 69.24 \times 6^3}{12} + 2 \times \frac{2 \times 69.24 \times 6 \times (150 - 6)^2}{4}\right] + \frac{7 \times (150 - 2 \times 6)^3}{12} = 10.15 \times (10)^6\ \mathrm{mm}^4$$

Effective section modulus about Z axis,

$$S_{z,eff} = 10.15 \times (10)^6 \times 2 / 150 = 135.4 \times (10)^3\ \mathrm{mm}^3$$

Effective moment of inertia about Y axis,

$$I_{y,eff} = \frac{2 \times 6 \times (2 \times 69.24)^3}{12} + \frac{0.5\left(150 - 6\right)7^3}{12} = 2.658 \times (10)^6 \text{ mm}^4$$

Effective section modulus about Y axis,

$$S_{y,eff} = 2.658 \times (10)^6 / 69.24 = 38.38 \times (10)^3 \text{ mm}^3$$

Major axis bending resistance if member is laterally supported,

$$M_{rz1} = \phi S_{z,eff} F_y = 0.9 \times 135.4 \times (10)^3 \times 300 = 36.55 \text{ kN} \cdot \text{m}$$

Minor axis bending resistance,

$$M_{ry} = \phi S_{y,eff} F_y = 0.9 \times 38.38 \times (10)^3 \times 300 = 10.36 \text{ kN} \cdot \text{m}$$

If the member is laterally unsupported major axis bending resistance is determined by clause 13.6(b).

As the value of one of the end moments is 0.0, $\omega_2 = 1.75$.

Where, as per clause 13.6(a),

$$EI_y GJ = 205{,}000 \times 38.8(10)^6 \times 78{,}850 \times 38.06(10)^3 = 23.87 \times 10^{21} \text{ MPa}^2 \cdot \text{mm}^8$$

$$\left(\frac{\pi E}{L}\right)^2 I_y C_w = \left(\frac{\pi \times 205{,}000}{2{,}000}\right)^2 3.38 \times 10^6 \times 17.52 \times 10^9 = 6.14 \times 10^{21} \text{ MPa}^2 \cdot \text{mm}^8$$

$$M_u = \frac{\omega_2 \pi}{L} \sqrt{E I_y G J + \left(\frac{\pi E}{L}\right)^2 I_y C_w}$$

$$= \frac{1.75 \times \pi}{2{,}000} \sqrt{23.87 \times 10^{21} + 6.14 \times 10^{21}} = 476.2 \times 10^6 \text{ N} \cdot \text{mm} = 476.2 \text{ kN} \cdot \text{m}$$

$$M_y = S_z F_y = \frac{10.87(10)^6 \times 2}{150} 300 = 43.48 \text{ kN} \cdot \text{m}$$

Since $M_u > 0.65 \times M_y = 28.26$, Moment of resistance

$$M_{rz2} = 1.15 \times 0.9 \times 43.48 \times \left(1 - 0.28 \frac{43.48}{248}\right) = 42.79 \text{kN} \cdot \text{m}$$

Mrz2 should not be more than Mrz1. Since, Mrz2 > Mrz1 in this example, Mrz2 = Mrz1.

$$M_{rz2} = 36.55 \text{ kN-m}$$

Comparison

Table 598: Comparison of results

Criteria	Hand Calculation	STAAD.Pro Result	Comments
Axial compressive resistance (kN)	521.7	521.9	negligible
Major axis bending resistance (kN-m)	36.55	36.57	negligible
Minor axis bending resistance (kN-m)	10.36	10.38	negligible

Problem

The W250x73 column has the following concentrated loads

$C_f = 900$ kN

And a uniform moment of:

$M_{fx} = 180$ kN·m

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (`FYLD`). The beam is braced against lateral-torsional buckling only at the ends (`LAT 0`, default)

Calculations

Axial Capacity

Determine the buckling load of the column:

$$\left(\frac{KL}{r}\right)_x = \frac{1.0(3,\ 600)}{110} = 32.7$$

$$\left(\frac{KL}{r}\right)_y = \frac{1.0(3,\ 600)}{64.6} = 55.7$$

The largest slenderness ratio controls:

$$F_{ex} = \frac{\pi^2 E}{\left(\frac{KL}{r}\right)_x^2} = \frac{\pi^2(200,\ 000)}{(55.7)^2} = 635.6 \text{ kN}$$

$$\lambda = \sqrt{\frac{F_y}{F_{ey}}} = \sqrt{\frac{350}{635.6}} = 0.742$$

$$C_r = \phi A F_y\left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9,\ 280 \times 350\left[1 + 0.742^{(2\times1.34)}\right]^{-1/1.34} = 2,\ 216 \times (10)^6 \text{ N} = 2,\ 216 \text{ kN}$$

Moment Modifier

Uniform moment:

$$\omega_1 = 1.0$$

Calculate the elastic buckling load for the bending axis:

$$C_e = \frac{\pi^2 \times 200,\ 000 \times 113 \times 10^6}{(1.0 \times 3,\ 600)^2} = 17,\ 211\text{kN}$$

$$U_{1x} = \frac{1.0}{1 - \frac{900}{17,\ 211}} = 1.06$$

Bending Capacity

$$\omega_2 = 1.0$$

$$EI_yGJ = 200{,}000 \times 38.8 \times 76.92 \times 575 = 343.2 \times 10^{21}\ \text{MPa}^2 \cdot \text{mm}^8$$

$$\left(\frac{\pi E}{L}\right)^2 I_y C_w = \left(\frac{\pi \times 200,\ 000}{3,\ 600}\right)^2 38.8 \times 553 = 653.6 \times 10^{21}\ \text{MPa}^2 \cdot \text{mm}^8$$

$$M_u = \frac{\omega_2 \pi}{L}\sqrt{EI_yGJ + \left(\frac{\pi E}{L}\right)^2 I_y C_w}$$

$$= \frac{1.0 \times \pi}{3{,}600}\sqrt{343.2 \times 10^{21} + 653.6 \times 10^{21}} = 871 \times 10^6\ \text{N} \cdot \text{mm} = 871\ \text{kN} \cdot \text{m}$$

Plastic moment capacity:

$$M_p = Z_xF_y = 985 \times 10^3 \times 350 = 345 \times 10^6\ \text{N} \cdot \text{mm} = 345\ \text{kN} \cdot \text{m}$$

$$M_u = 871\ \text{kN} \cdot \text{m} > 0.67 \times M_p = 0.67 \times 345 = 231\ \text{kN} \cdot \text{m}$$

Therefore, the moment capacity is calculated as:

$$M_r = 1.15\phi M_p\left(1 - \frac{0.28M_p}{M_u}\right) = 1.15 \times 0.9 \times 345\left(1 - \frac{0.28 \times 345}{871}\right) = 317\ \text{kN} \cdot \text{m}$$

Check the capacity based on the strength cross-section:

$$M_{rx} = 0.9 \times 985 \times 10^3 \times 350 = 310\ \text{kN} \cdot \text{m}$$

This governs capacity.

Combined Stress Ratio

$$\frac{900}{2,\ 216} + \frac{0.85 \times 1.06 \times 180}{310} = 0.406 + 0.523 = 0.929 < 1.0$$

Comparison

Table 599: Comparison of results

Criteria	Reference	STAAD.Pro	Difference

Problem

A W250x73 section is used for a pedestal with a height of 1.1 m.

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (FYLD)

Calculations

The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Local Element Buckling

Evaluate the slenderness effects of the column web:

$$\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8$$

Evaluate the slenderness effects of the column flanges:

$$\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7$$

Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

Column Capacity

Assume K = 1.0,

$$\frac{L}{r_x} = \frac{1,100}{110} = 10$$

$$\frac{L}{r_y} = \frac{1,100}{64.6} = 17.03$$

The largest slenderness ration controls, thus the slenderness factor for buckling about the minor axis:

$$F_e = \frac{\pi^2 E}{kL\ / r_y} = \frac{\pi^2 205 \times 10^3}{1 \times 17.03} = 6,978 \text{ kN}$$

$$\lambda = \sqrt{\frac{F_y}{F_e}} = \sqrt{\frac{350}{6,978}} = 0.224$$

When n = 1.34 (Group 2 W shape),

$$C_r = \phi A F_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9,\ 280 \times 350\left[1 + 0.224^{(2 \times 1.34)}\right]^{-1/1.34} = 2.884 \times (10)^6 \text{ N} = 2,\ 884 \text{ kN}$$

Comparison

Table 600: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
KL/r, major	10	9.968	negligible

V. CSA S16-01 - Slender Column Compression

Determine the factored compressive resistance of a slender column.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 4.2

Related Links

- *D4.B. Canadian Codes - Steel Design per CSA Standard CAN/CSA-S16-01* (on page 1419)

Problem

A W250x73 section is used for a pedestal with a height of 11.0 m.

The material used is G40.21 350W steel (F_y = *350 MPa*) (FYLD)

Calculations

The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Local Element Buckling

Evaluate the slenderness effects of the column web:

$$\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8$$

Evaluate the slenderness effects of the column flanges:

$$\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7$$

Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

Column Capacity

Assume K = 1.0,

$$\frac{L}{r_x} = \frac{11,\ 000}{110} = 100$$

$$\frac{L}{r_y} = \frac{11,\ 000}{64.6} = 170.3$$

The largest slenderness ration controls, thus the slenderness factor for buckling about the minor axis:

$$F_e = \frac{\pi^2 \times 205,\ 000}{(1.0 \times 170.3)^2} = 69.78 \text{ kN}$$

$$\lambda = \sqrt{\frac{F_y}{F_e}} = \sqrt{\frac{350}{69.78}} = 2.24$$

When n = 1.34 (Group 2 W shape),

$$C_r = \phi A F_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9,\ 280 \times 350\left[1 + 2.24^{(2\times1.34)}\right]^{-1/1.34} = 0.529 \times (10)^6 \text{ N} = 537.3 \text{ kN}$$

Comparison

Table 601: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
KL/r, major	100	99.684	negligible
KL/r, minor	170.3	170.118	negligible

V. CSA S16-01 - Wide Flange Beam Interaction Ratio 1

Reference

CAN/CSA-S16.1-94, National Standard of Canada, Limit States Design of Steel Structures. The Canadian Standards Association, 1994 with CISC (Canadian Institute of Steel Construction) handbook. CISC Example 1 page 5-91.

Related Links

- *D4.B. Canadian Codes - Steel Design per CSA Standard CAN/CSA-S16-01* (on page 1419)

Problem

Find the interaction ratio, beam resistance and beam deflection.

Given

E = 200000 MPa (STEEL)
F_y = 300 Mpa CSA G40.21-M

Simply supported beam has a 8.0 m span; Ky is 1.0, Kz 1.0, unsupported length 1.0 m

Allowable Live Load deflection, L/300 = 8000/300 = 27 mm

Factored Uniform Load IS 7 kN/m DEAD, 15 kN/m LIVE.

Steel section is W410X54

Comparison

Table 602: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
Interaction Ratio	0.88	0.882	negligible
Beam Resistance (kN·m)	284	283.5	negligible
Beam Deflection (mm)	21	21.39	negligible

Problem

Find the interaction ratio, beam and column resistance.

Given

E = 200,000 MPa (STEEL).
F_y = 300 MPa CSA G40.21-M

Simply supported beam/column has a 3.7 m span, Ky is 1.0, Kz 1.0. Factored axial load is 2000 kN and end moments of 200 kN·m and 300 kN·m.

Steel section is W310X118

Comparison

Table 603: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
Interaction Ratio	0.940	0.941	negligible
Beam Resistance (kN·m)	606	605.5	negligible
Column Resistance (kN)	3,850	3,849	negligible

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-01 - Wide Flange Beam Interaction Ratio 2.STD` is typically installed with the program.

Problem

Find the interaction ratio, beam, and column resistance.

Given

E = 200,000 MPa (STEEL)
F_y = 345 MPa (ASTM A992)

Simply supported beam/column has a 3.7 m span, Ky is 1.0, Kz 1.0, Lu = 3.7 m

The factored axial load is 2,000 kN and end moments of 200 kN·m and 300 kN·m in the strong axis and 50 kN·m at each end in the weak axis.

Steel section is W310X129.

Comparison

Table 604: CAN/CSA-S16 comparison

Criteria	Reference	STAAD.Pro	Difference
Interaction Ratio	0.990	0.990	none
Beam Resistance, Weak axis (kN·m)	308	307.7	negligible
Beam Resistance, Strong axis (kN·m)	671	670.7	negligible
Column Resistance (kN)	4,240	4,242	negligible

STAAD Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-01 - Wide Flange Beam Interaction Ratio 3.STD` is typically installed with the program.

V.CSA S16-09 - Axial Tension

Design of a double-angle member subject to tension load.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 3.1

Related Links

- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1447)

Problem

Design a tension diagonal in an all-welded truss (`SNU 0` for welded). Attached to WT 265x61.5 chords (t_w = 13.1 mm).

$$L = 4 \text{ m}$$

$$T_f = 630 \text{ kN}$$

The material used is G40.21 300W steel (F_y = *300 MPa*, F_u = *450 MPa*) (`FYLD` and `FU`)

Calculations

Gross area is used for welded connections.

$$T_r = \max \begin{cases} \phi A F_y = 0.9 \times 300 \times A = 270A \\ \phi_u A F_u = 0.75 \times 450 \times A = 338A \end{cases}$$

$T_r \geq T_f$, so solve for A:

$$A = \frac{630 \times (10)^3}{270} = 2,\ 333\text{mm}^2$$

Select a pair of angles with at least this gross area: try a 2- 76x64x9.5, with long legs back-to-back:

$$A = 2{,}480 \text{ mm}^2$$

$$r_{min} = 13.3 \text{ mm}$$

Calculate the effective net area due to shear lag. The average weld length is taken as $(120\ mm + 250\ mm)/2 = 185\ mm$.

The long leg does not have a reduction in area shear lag, thus:

$$A_{n2} = 1.00 \times (76 - 9.5) \times 9.5 = 632 \text{ mm}^2$$

The outstanding (short) leg has an eccentricity of half the leg length, or $64/2 = 32\ mm$.

$$A_{n3} = \left(1 - \frac{32}{250}\right) \times 64 \times 9.5 = 530\text{mm}^2$$

The total net area for the pair of angles for the rupture limit state is:

$$A_{ne} = 632 + 530 = 1,162 \text{ mm}^2$$

For the pair of angles, $A_{ne} = 2×1,1162 = 2,324\ mm^2$; the ratio of net section area to gross area = 2,324 / 2,480 = 0.937 (NSF).

Checking the yielding limit state:

$$T_r = 0.90×2,480×300 = 670 \text{ kN}$$

Checking the rupture limit state:

$$T_r = 0.75×2,324×450 = 784 \text{ kN}$$

Yielding governs, and the critical ratio is: $630/670 = 0.94$.

Comparison

Table 605: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
T_f (kN)	670	669.6	negligible
Critical Ratio	0.94	0.941	negligible

Note: If the member SELECT facility is used in place of a code CHECK, STAAD.Pro will actually select a 2-L 102x89x6.4 member, which has a critical ratio of 0.997 (per Cl. 13.2) and an area of 2,340 mm^2, thus more economical (the NSF used for this size is 0.923).

V.CSA S16-09 - Beam Bending

Determine the uniformly factored load that the member can resist.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 5.1

Related Links

- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1447)

Problem

A W310x52 beam spans 7.3 m. Both ends of the beam are supported by columns connected standard web angle connections.

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (FYLD)

Calculations

The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Section Classification

Evaluate the slenderness effects of the beam flanges:

$$\frac{b}{2t} = \frac{167}{2 \times 13.2} = 6.3 < \frac{170}{\sqrt{350}} = 9.1$$

Evaluate the slenderness effects of the beam web:

$$\frac{h}{w} = \frac{318 - 2(13.2)}{7.6} = 38.4 < \frac{1,700}{\sqrt{350}} = 90.9$$

Both the beam flanges and web are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 5.7.

Bending Capacity

Factored moment resistance is:

$$M_r = \phi Z_x F_y = 0.90 \times 841 \times (10)^3 \times 350 = 265 \times (10)^3 \text{ N·mm} = 265 \text{ kN·m}$$

Equate this to the bending moment due to a uniformly distributed load and solve for the load:

$$M_r \geq \frac{w_f L^2}{8}$$

$$w_f = \frac{8M_r}{L^2} = \frac{8 \times 265}{(7.3)^2} = 39.8 \text{ kN/m}$$

Comparison

Table 606: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
M_r (kN·m)	265	265	none
w_f (kN/m)	39.8	39.76*	negligible

Note: (*) STAAD.Pro does calculate the allowable uniform load on the beam. Instead, this is done by applying a uniform load incrementally until the critical ratio is ≈ 1.0. The, this uniform load is divided by the resulting critical ratio to normalize the distributed load capacity of the beam. Thus, *39.8/1.001 = 39.67 kN/m*

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\S16 2009\CSA S16-09 - Beam Bending.STD` is typically installed with the program.

V.CSA S16-09 - Beam Shear Capacity

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 5.3

Related Links

- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1447)

Problem

The W530x82 beam has a maximum shear force, $v = 540\ kN$ due to factored loads.

L = 11.0 m

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (FYLD)

Calculations

Evaluate the slenderness effects of the beam web:

$$\frac{h}{w} = \frac{528 - 2(13.3)}{9.5} = 52.8 < 439\sqrt{\frac{k_v}{F_y}} = 439\sqrt{\frac{5.34}{350}} = 54.2$$

Therefore the shear capacity is calculated as:

$$V_r = \phi \times A_w \times F_y = 0.9 \times 528 \times 9.5 \times 350 = 1{,}043 \text{ kN}$$

Calculate Equivalent Concentrated Load

The given end moments and assumed distributed loads (which was determined to given an equivalent mid-span moment of the given example) do not result in a shear force of 540 kN. Therefore, an additional concentrated load is added near the first support.

$$R_1 = \frac{w_f L}{2} + \frac{M_1 - M_2}{L} = \frac{40.17 \times 11.0}{2} + \frac{540 - 185}{11.0} = 253.2 \text{ kN}$$

$$P = 540 \text{ kN} - 253.2 \text{ kN} = 287 \text{ kN}$$

The STAAD.Pro will have this load applied at 1 mm away from the left support.

Comparison

Table 607: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
V_r (kN)	1,043	1,042.826	negligible

V.CSA S16-09 - Select a Beam

Select a wide-flange shape for the given beam span.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 5.2

Related Links

- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1447)

Problem

A beam must be selected to span 11.0 m. The end moment of the span are:

$$M_1 = -540 \text{ kN·m}$$

$$M_2 = -185 \text{ kN·m}$$

And the maximum moment in the span is:

$$M_3 = 256 \text{ kN}\cdot\text{m}$$

The beam is braced at 2.5 m from the center of each supporting column (thus $L_b = 6.0\ m$) (`LT 6.0`).

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (`FYLD`)

Calculations

Assume a Class 2 section:

$$M_r = \phi M_p = \phi Z_x F_y$$

Thus,

$$Z_x \geq \frac{540(10)^6}{0.9 \times 350} = 1,714 \times (10)^3 \text{ mm}^3$$

Try a W460x82:

$$Z_x = 1{,}830 \times (10)^3 \text{ mm}^3, \text{ tf} = 16.0 \text{ mm}, \text{ bf} = 191.0 \text{ mm}, \text{ tw} = 9.9 \text{ mm}, \text{ D} = 460.0 \text{ mm}$$

Evaluate the slenderness effects of the beam flanges:

$$\frac{b}{2t} = \frac{191}{2 \times 16.0} = 5.7 < \frac{170}{\sqrt{350}} = 9.1$$

Evaluate the slenderness effects of the beam web:

$$\frac{h}{w} = \frac{460 - 2(16.0)}{9.9} = 43.2 < \frac{1,700}{\sqrt{350}} = 90.9$$

The assumptions are valid and this beam is sufficient to support the given moments.

$$M_r = 0.9 \times 1{,}830 \times (10)^3 \times 350\ [(10)^{-6}] = 576.5 \text{ kN}\cdot\text{m}$$

Ratio = $540\ /\ 576.5 = 0.937$

Comparison

Table 608: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
Section	W460x82 *	W460x82	none
M_r (kN·m)	576.5 **	576	negligible
Critical Ratio	0.937 **	0.937	none

Notes:

*The reference also tries a W530x82, which is stiffer for the same weight. STAAD.Pro selects the shallower beam.
** The reference does not calculate the resisting moment capacity nor the critical ratio for either section size, but they are evaluated here for completeness.

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\S16 2009\CSA S16-09 - Select a Beam.STD` is typically installed with the program.

In order to model this beam in STAAD.Pro, we need to determine the distributed load which would result in the same mid-span moment on a beam with the given end moments. From the AISC Streel Construction Manual, p 3-222:

$$M_3 = \frac{w_f L^2}{8} - \frac{(M_1 + M_2)}{2} + \frac{(M_1 - M_2)^2}{2w_f L^2}$$

$$256 = \frac{w_f (11.0)^2}{8} - \frac{(540 + 185)}{2} + \frac{(540 - 185)^2}{2w_f (11.0)^2}$$

Solving this yields $w_f = 40.033\ kN/m$

Problem

The W250x73 column has the following concentrated loads

$$C_f = 900 \text{ kN}$$

And a uniform moment of:

$$M_{fx} = 180 \text{ kN·m}$$

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (`FYLD`). The beam is braced against lateral-torsional buckling only at the ends (`LAT 0`, default)

Calculations

Axial Capacity

Determine the buckling load of the column:

$$\left(\frac{KL}{r}\right)_x = \frac{1.0(3,\ 600)}{110} = 32.7$$

$$\left(\frac{KL}{r}\right)_y = \frac{1.0(3,\ 600)}{64.6} = 55.7$$

The largest slenderness ratio controls:

$$F_{ex} = \frac{\pi^2 E}{\left(\frac{KL}{r}\right)_x^2} = \frac{\pi^2(200,\ 000)}{(55.7)^2} = 635.6 \text{ kN}$$

$$\lambda = \sqrt{\frac{F_y}{F_{ey}}} = \sqrt{\frac{350}{635.6}} = 0.742$$

$$C_r = \phi A F_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9,\ 280 \times 350\left[1 + 0.742^{(2\times1.34)}\right]^{-1/1.34} = 2,\ 216 \times (10)^6 \text{ N} = 2,\ 216 \text{ kN}$$

Moment Modifier

Uniform moment:

$$\omega_1 = 1.0$$

Calculate the elastic buckling load for the bending axis:

$$C_e = \frac{\pi^2 \times 200,\ 000 \times 113 \times 10^6}{(1.0 \times 3,\ 600)^2} = 17,\ 211\text{kN}$$

$$U_{1x} = \frac{1.0}{1 - \frac{900}{17,\ 211}} = 1.06$$

Bending Capacity

$$\omega_2 = 1.0$$

$$EI_yGJ = 200{,}000\times38.8\times76.92\times575= 343.2\times10^{21} \text{ MPa}^2 \cdot\text{mm}^8$$

$$\left(\frac{\pi E}{L}\right)^2 I_y C_w = \left(\frac{\pi \times 200,\ 000}{3,\ 600}\right)^2 38.8 \times 553 = 653.6 \times 10^{21} \text{ MPa}^2 \cdot \text{mm}^8$$

$$M_u = \frac{\omega_2 \pi}{L}\sqrt{EI_yGJ + \left(\frac{\pi E}{L}\right)^2 I_y C_w}$$

$$= \frac{1.0 \times \pi}{3{,}600}\sqrt{343.2 \times 10^{21} + 653.6 \times 10^{21}} = 871 \times 10^6 \text{ N}\cdot\text{mm} = 871 \text{ kN}\cdot\text{m}$$

Plastic moment capacity:

$$M_p = Z_x F_y = 985\times10^3 \times 350 = 345\times10^6 \text{ N}\cdot\text{mm} = 345 \text{ kN}\cdot\text{m}$$

$$M_u = 871 \text{ kN}\cdot\text{m} > 0.67\times M_p = 0.67\times345 = 231 \text{ kN}\cdot\text{m}$$

Therefore, the moment capacity is calculated as:

$$M_r = 1.15\phi M_p\left(1 - \frac{0.28M_p}{M_u}\right) = 1.15 \times 0.9 \times 345\left(1 - \frac{0.28 \times 345}{871}\right) = 317 \text{ kN}\cdot\text{m}$$

Check the capacity based on the strength cross-section:

$$M_{rx} = 0.9\times985\times10^3 \times350 = 310 \text{ kN}\cdot\text{m}$$

This governs capacity.

Combined Stress Ratio

$$\frac{900}{2,\ 216} + \frac{0.85 \times 1.06 \times 180}{310} = 0.406 + 0.523 = 0.929 < 1.0$$

Comparison

Table 609: Verification Problem comparison

Criteria	Reference	STAAD.Pro	Difference
$(KL/r)_x$	33	32.624	negligible
$(KL/r)_y$	56	55.675	negligible
C_r (kN)	2,216	2,220	negligible
C_e (kN)	17,211	17,200	negligible
Stress Ratio	0.929	0.926	negligible

Note: Both the reference and hand calculations agree with the STAAD.Pro results that the section is adequate. The reference however neglects to account for section capacity checks, which control in this case.

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\S16 2009\CSA S16-09 - Shear Capacity Combined Stresses.STD` is typically installed with the program.

V.CSA S16-09 - Short Column Compression

Determine the factored compressive resistance of a short column.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 4.1

Problem

A W250x73 section is used for a pedestal with a height of 1.1 m.

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (FYLD)

Calculations

The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Local Element Buckling

Evaluate the slenderness effects of the column web:

$$\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8$$

Evaluate the slenderness effects of the column flanges:

$$\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7$$

Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

Column Capacity

Assume K = 1.0,

$$\frac{L}{r_x} = \frac{1,\ 100}{110} = 10$$

$$\frac{L}{r_y} = \frac{1,\ 100}{64.6} = 17$$

The largest slenderness ration controls, thus the slenderness factor for buckling about the minor axis:

$$\lambda = \left(\frac{KL}{r}\right)_{\max}\sqrt{\frac{F_y}{\pi^2 E}} = 17\sqrt{\frac{350}{\pi^2 200,\ 000}} = 0.227$$

When n = 1.34 (Group 2 W shape),

$$C_r = \phi A F_y\left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9,\ 280 \times 350\left[1 + 0.227^{(2\times1.34)}\right]^{-1/1.34} = 2.883 \times (10)^6 \text{ N} = 2,\ 883 \text{ kN}$$

Comparison

Table 610: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
KL/r, major	10	9.968	negligible
KL/r, minor	17	17.012	negligible
λ, critical	0.227	0.224	1.3%
C_r (kN)	2,883	2,884.358	negligible

V.CSA S16-09 - Slender Column Compression

Determine the factored compressive resistance of a slender column.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 4.2

Related Links

- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1447)

Problem

A W250x73 section is used for a pedestal with a height of 11.0 m.

The material used is G40.21 350W steel (F_y = *350 MPa*) (FYLD)

Calculations

The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Local Element Buckling

Evaluate the slenderness effects of the column web:

$$\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8$$

Evaluate the slenderness effects of the column flanges:

$$\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7$$

Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

Column Capacity

Assume K = 1.0,

$$\frac{L}{r_x} = \frac{11,\ 000}{110} = 100$$

$$\frac{L}{r_y} = \frac{11,\ 000}{64.6} = 170$$

The largest slenderness ration controls, thus the slenderness factor for buckling about the minor axis:

$$F_e = \frac{\pi^2 \times 200,\ 000}{(1.0 \times 170)^2} = 68.3 \text{ kN}$$

$$\lambda = \sqrt{\frac{F_y}{F_e}} = \sqrt{\frac{350}{68.3}} = 2.26$$

When n = 1.34 (Group 2 W shape),

$$C_r = \phi A F_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9,\ 280 \times 350\left[1 + 2.26^{(2\times 1.34)}\right]^{-1/1.34} = 0.529 \times (10)^6 \text{ N} = 529 \text{ kN}$$

Comparison

Table 611: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
KL/r, major	100	99.684	negligible
KL/r, minor	170	170.118	negligible
λ, critical	2.26	2.237	1.0%

Criteria	Reference	STAAD.Pro	Difference
C_r (kN)	529	538.161	1.7%

V.CSA S16-09 - Wide Flange Capacity Combined Stresses

Check the capacity of a wide-flange column under combined stresses.

Reference

Problem

The W250x73 column has the following concentrated loads applied at the top of the column:

$$C_f = 900 \text{ kN}$$

$$M_{fx} = 180 \text{ kN·m}$$

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (`FYLD`). The column is assumed to be braced laterally against lateral-torsional buckling (`LAT 1`).

$$L = 3.6 \text{ m}$$

Calculations

Local Element Buckling

Evaluate the slenderness effects of the column web:

$$\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8$$

Evaluate the slenderness effects of the column flanges:

$$\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7$$

Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

Axial Capacity

Determine the buckling load of the column, assuming that weak axis bucking will not control due to bracing:

$$\left(\frac{KL}{r}\right)_x = \frac{1.0(3,\ 600)}{110} = 32.7$$

The largest slenderness ratio controls:

$$F_{ex} = \frac{\pi^2 E}{\left(\frac{KL}{r}\right)_x^2} = \frac{\pi^2 (200,\ 000)}{(32.7)^2} = 1,\ 847 \text{ kN}$$

$$\lambda = \sqrt{\frac{F_y}{F_{ey}}} = \sqrt{\frac{350}{1,\ 847}} = 0.435$$

$$C_r = \phi A F_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9,\ 280 \times 350\left[1 + 0.435^{(2\times 1.34)}\right]^{-1/1.34} = 2,\ 716 \times (10)^6 \text{ N} = 2,\ 716 \text{ kN}$$

Moment Modifier

$\kappa = -0/180 = 0$

$\omega_1 = 0.6 - 0.4\kappa = 0.6 \leq 1.0$

Calculate the elastic buckling load for the bending axis:

$$C_e = \frac{\pi^2 \times 200,\ 000 \times 113 \times 10^6}{(1.0 \times 3,\ 600)^2} = 17,\ 211\text{kN}$$

$$U_{1x} = \frac{0.6}{1 - \left(\frac{900}{17,\ 210}\right)} = 0.633$$

Bending Capacity

From a previous example, the W250x73 is a Class 2 section. It is laterally supported along its length, thus:

$M_{rx} = 0.9 \times 985 \times 10^3 \times 350 = 310 \text{ kN}\cdot\text{m}$

Combined Stress Ratio

$$\frac{900}{2,\ 716} + \frac{0.85 \times 0.633 \times 180}{310} = 0.331 + 0.312 = 0.644 < 1.0$$

This is the check for overall member strength. However, there is another case that actually controls in this instance: checking for cross sectional strength.

$C_r = 0.9 \times 9{,}280 \times 350 = 2{,}923 \text{ kN}$

$U_{1x} = 1.0$

$$\frac{900}{2,\ 923} + \frac{0.85 \times 1.0 \times 180}{310} = 0.308 + 0.494 = 0.801 < 1.0$$

Comparison

Table 612: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
$(KL/r)_x$	33	32.624	negligible
$(KL/r)_y$	56	55.675	negligible
C_r (kN)	2,716	2,715.935	negligible
C_e (kN)	17,211	17,600	2.3%
Stress Ratio	0.644	0.643	none
Stress Ratio (Critical)	0.801	0.801	none

Note: Both the reference and hand calculations agree with the STAAD.Pro results that the section is adequate. The reference however neglects to account for section capacity checks, which control in this case.

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\S16 2009\CSA S16-09 - Wide Flange Capacity Combined Stresses.STD` is typically installed with the program.

V. CSA S16-14 - Axial Tension

Design of a double-angle member subject to tension load.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 3.1

Related Links

- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1447)

Problem

Design a tension diagonal in an all-welded truss (`SNU 0` for welded). Attached to WT 265x61.5 chords (t_w = 13.1 mm).

$$L = 4 \text{ m}$$

$$T_f = 630 \text{ kN}$$

The material used is G40.21 300W steel (F_y = *300 MPa*, F_u = *450 MPa*) (`FYLD` and `FU`)

Calculations

Gross area is used for welded connections.

$$T_r = \max\begin{cases} \phi AF_y = 0.9 \times 300 \times A = 270A \\ \phi_u AF_u = 0.75 \times 450 \times A = 338A \end{cases}$$

$T_r \geq T_f$, so solve for A:

$$A = \frac{630 \times (10)^3}{270} = 2,\ 333\text{mm}^2$$

Select a pair of angles with at least this gross area: try a 2- 76x64x9.5, with long legs back-to-back:

$$A = 2{,}480 \text{ mm}^2$$

$$r_{min} = 13.3 \text{ mm}$$

Calculate the effective net area due to shear lag. The average weld length is taken as *(120 mm + 250 mm)/2 = 185 mm*.

The long leg does not have a reduction in area shear lag, thus:

$$A_{n2} = 1.00 \times (76 - 9.5) \times 9.5 = 632 \text{ mm}^2$$

The outstanding (short) leg has an eccentricity of half the leg length, or *64/2 = 32 mm*.

$$A_{n3} = \left(1 - \frac{32}{250}\right) \times 64 \times 9.5 = 530\text{mm}^2$$

The total net area for the pair of angles for the rupture limit state is:

$$A_{ne} = 632 + 530 = 1{,}162 \text{ mm}^2$$

For the pair of angles, A_{ne} = *2×1,1162 = 2,324 mm²* ; the ratio of net section area to gross area = 2,324 / 2,480 = 0.937 (`NSF`).

Checking the yielding limit state:

$$T_r = 0.90 \times 2{,}480 \times 300 = 670 \text{ kN}$$

Checking the rupture limit state:

$$T_r = 0.75 \times 2{,}324 \times 450 = 784 \text{ kN}$$

Yielding governs, and the critical ratio is: $630/670 = 0.94$.

Comparison

Table 613: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
T_f (kN)	670	669.6	negligible
Critical Ratio	0.94	0.941	negligible

Note: If the member SELECT facility is used in place of a code CHECK, STAAD.Pro will actually select a 2-L 102x89x6.4 member, which has a critical ratio of 0.997 (per Cl. 13.2) and an area of 2,340 mm^2, thus more economical (the NSF used for this size is 0.923).

STAAD Input

V. CSA S16-14 - Beam Bending

Determine the uniformly factored load that the member can resist.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 5.1

Related Links

- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1447)

Problem

A W310x52 beam spans 7.3 m. Both ends of the beam are supported by columns connected standard web angle connections.

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (FYLD)

Calculations

The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Section Classification

Evaluate the slenderness effects of the beam flanges:

$$\frac{b}{2t} = \frac{167}{2 \times 13.2} = 6.3 < \frac{170}{\sqrt{350}} = 9.1$$

Evaluate the slenderness effects of the beam web:

$$\frac{h}{w} = \frac{318 - 2(13.2)}{7.6} = 38.4 < \frac{1,\ 700}{\sqrt{350}} = 90.9$$

Both the beam flanges and web are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 5.7.

Bending Capacity

Factored moment resistance is:

$$M_r = \phi Z_x F_y = 0.90 \times 841 \times (10)^3 \times 350 = 265 \times (10)^3 \text{ N}\cdot\text{mm} = 265 \text{ kN}\cdot\text{m}$$

Equate this to the bending moment due to a uniformly distributed load and solve for the load:

$$M_r \geq \frac{w_f L^2}{8}$$

$$w_f = \frac{8M_r}{L^2} = \frac{8 \times 265}{(7.3)^2} = 39.8 \text{ kN/m}$$

Comparison

Table 614: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
M_r (kN·m)	265	265	none
w_f (kN/m)	39.8	39.76*	negligible

Note: (*) STAAD.Pro does calculate the allowable uniform load on the beam. Instead, this is done by applying a uniform load incrementally until the critical ratio is ≈ 1.0. The, this uniform load is divided by the resulting critical ratio to normalize the distributed load capacity of the beam. Thus, $39.8/1.001 = 39.67\ kN/m$

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-14 - Beam Bending.STD` is typically installed with the program.

V. CSA S16-14 - Beam Shear Capacity

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 5.3

Related Links

- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1447)

Problem

The W530x82 beam has a maximum shear force, $v = 540\ kN$ due to factored loads.

$$L = 11.0 \text{ m}$$

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (FYLD)

Calculations

Evaluate the slenderness effects of the beam web:

$$\frac{h}{w} = \frac{528 - 2(13.3)}{9.5} = 52.8 < 439\sqrt{\frac{k_v}{F_y}} = 439\sqrt{\frac{5.34}{350}} = 54.2$$

Therefore the shear capacity is calculated as:

$$V_r = \phi \times A_w \times F_y = 0.9 \times 528 \times 9.5 \times 350 = 1{,}043 \text{ kN}$$

Calculate Equivalent Concentrated Load

The given end moments and assumed distributed loads (which was determined to given an equivalent mid-span moment of the given example) do not result in a shear force of 540 kN. Therefore, an additional concentrated load is added near the first support.

$$R_1 = \frac{w_f L}{2} + \frac{M_1 - M_2}{L} = \frac{40.17 \times 11.0}{2} + \frac{540 - 185}{11.0} = 253.2 \text{ kN}$$

$$P = 540 \text{ kN} - 253.2 \text{ kN} = 287 \text{ kN}$$

The STAAD.Pro will have this load applied at 1 mm away from the left support.

Comparison

Table 615: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
V_r (kN)	1,043	1,042.826	negligible

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-14 - Beam Shear Capacity.STD` is typically installed with the program.

V. CSA S16-14 - Select a Beam

Select a wide-flange shape for the given beam span.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 5.2

Related Links

- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1447)

Problem

A beam must be selected to span 11.0 m. The end moment of the span are:

$$M_1 = -540 \text{ kN}\cdot\text{m}$$

$$M_2 = -185 \text{ kN}\cdot\text{m}$$

And the maximum moment in the span is:

$$M_3 = 256 \text{ kN}\cdot\text{m}$$

The beam is braced at 2.5 m from the center of each supporting column (thus $L_b = 6.0\ m$) (`LT 6.0`).

The material used is G40.21 350W steel (F_y = *350 MPa*) (`FYLD`)

Calculations

Assume a Class 2 section:

$$M_r = \phi M_p = \phi Z_x F_y$$

Thus,

$$Z_x \geq \frac{540(10)^6}{0.9 \times 350} = 1,\ 714 \times (10)^3\ \mathrm{mm}^3$$

Try a W460x82:

Z_x = 1,830×$(10)^3$ mm^3, tf = 16.0 mm, bf = 191.0 mm, tw = 9.9 mm, D = 460.0 mm

Evaluate the slenderness effects of the beam flanges:

$$\frac{b}{2t} = \frac{191}{2 \times 16.0} = 5.7 < \frac{170}{\sqrt{350}} = 9.1$$

Evaluate the slenderness effects of the beam web:

$$\frac{h}{w} = \frac{460 - 2(16.0)}{9.9} = 43.2 < \frac{1,\ 700}{\sqrt{350}} = 90.9$$

The assumptions are valid and this beam is sufficient to support the given moments.

$$M_r = 0.9 \times 1{,}830 \times (10)^3 \times 350\ [(10)^{-6}] = 576.5\ \mathrm{kN \cdot m}$$

Ratio = *540 / 576.5 = 0.937*

Comparison

Table 616: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
Section	W460x82 *	W460x82	none
M_r (kN·m)	576.5 **	576	negligible
Critical Ratio	0.937 **	0.937	none

Notes:

*The reference also tries a W530x82, which is stiffer for the same weight. STAAD.Pro selects the shallower beam.
** The reference does not calculate the resisting moment capacity nor the critical ratio for either section size, but they are evaluated here for completeness.

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-14 - Select a Beam.STD` is typically installed with the program.

In order to model this beam in STAAD.Pro, we need to determine the distributed load which would result in the same mid-span moment on a beam with the given end moments. From the AISC Steel Construction Manual, p 3-222:

$$M_3 = \frac{w_f L^2}{8} - \frac{(M_1 + M_2)}{2} + \frac{(M_1 - M_2)^2}{2 w_f L^2}$$

$$256 = \frac{w_f (11.0)^2}{8} - \frac{(540 + 185)}{2} + \frac{(540 - 185)^2}{2 w_f (11.0)^2}$$

Solving this yields $w_f = 40.033\ kN/m$

Problem

The W250x73 column has the following concentrated loads

$C_f = 900$ kN

And a uniform moment of:

$M_{fx} = 180$ kN·m

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (`FYLD`). The beam is braced against lateral-torsional buckling only at the ends (`LAT 0`, default)

Calculations

Axial Capacity

Determine the buckling load of the column:

$$\left(\frac{KL}{r}\right)_x = \frac{1.0(3,\ 600)}{110} = 32.7$$

$$\left(\frac{KL}{r}\right)_y = \frac{1.0(3,\ 600)}{64.6} = 55.7$$

The largest slenderness ratio controls:

$$F_{ex} = \frac{\pi^2 E}{\left(\frac{KL}{r}\right)_x^2} = \frac{\pi^2(200,\ 000)}{(55.7)^2} = 635.6\text{ kN}$$

$$\lambda = \sqrt{\frac{F_y}{F_{ey}}} = \sqrt{\frac{350}{635.6}} = 0.742$$

$$C_r = \phi A F_y\left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9,\ 280 \times 350\left[1 + 0.742^{(2\times1.34)}\right]^{-1/1.34} = 2,\ 216 \times (10)^6\text{ N} = 2,\ 216\text{ kN}$$

Moment Modifier

Uniform moment:

$$\omega_1 = 1.0$$

Calculate the elastic buckling load for the bending axis:

$$C_e = \frac{\pi^2 \times 200,\ 000 \times 113 \times 10^6}{(1.0 \times 3,\ 600)^2} = 17,\ 211\text{kN}$$

$$U_{1x} = \frac{1.0}{1 - \frac{900}{17,\ 211}} = 1.06$$

Bending Capacity

$$\omega_2 = 1.0$$

$$EI_yGJ = 200{,}000 \times 38.8 \times 76.92 \times 575 = 343.2 \times 10^{21}\ \text{MPa}^2 \cdot \text{mm}^8$$

$$\left(\frac{\pi E}{L}\right)^2 I_y C_w = \left(\frac{\pi \times 200,\ 000}{3,\ 600}\right)^2 38.8 \times 553 = 653.6 \times 10^{21}\ \text{MPa}^2 \cdot \text{mm}^8$$

$$M_u = \frac{\omega_2 \pi}{L}\sqrt{EI_yGJ + \left(\frac{\pi E}{L}\right)^2 I_y C_w}$$

$$= \frac{1.0 \times \pi}{3{,}600}\sqrt{343.2 \times 10^{21} + 653.6 \times 10^{21}} = 871 \times 10^6\ \text{N}\cdot\text{mm} = 871\ \text{kN}\cdot\text{m}$$

Plastic moment capacity:

$$M_p = Z_x F_y = 985 \times 10^3 \times 350 = 345 \times 10^6\ \text{N}\cdot\text{mm} = 345\ \text{kN}\cdot\text{m}$$

$$M_u = 871\ \text{kN}\cdot\text{m} > 0.67 \times M_p = 0.67 \times 345 = 231\ \text{kN}\cdot\text{m}$$

Therefore, the moment capacity is calculated as:

$$M_r = 1.15\phi M_p\left(1 - \frac{0.28M_p}{M_u}\right) = 1.15 \times 0.9 \times 345\left(1 - \frac{0.28 \times 345}{871}\right) = 317\ \text{kN}\cdot\text{m}$$

Check the capacity based on the strength cross-section:

$$M_{rx} = 0.9 \times 985 \times 10^3 \times 350 = 310\ \text{kN}\cdot\text{m}$$

This governs capacity.

Combined Stress Ratio

$$\frac{900}{2,\ 216} + \frac{0.85 \times 1.06 \times 180}{310} = 0.406 + 0.523 = 0.929 < 1.0$$

Comparison

Table 617: Verification Problem comparison

Criteria	Reference	STAAD.Pro	Difference
$(KL/r)_x$	33	32.624	negligible

Criteria	Reference	STAAD.Pro	Difference
$(KL/r)_y$	56	55.675	negligible
C_r (kN)	2,216	2,220	negligible
C_e (kN)	17,211	17,200	negligible
Stress Ratio	0.929	0.926	negligible

Note: Both the reference and hand calculations agree with the STAAD.Pro results that the section is adequate. The reference however neglects to account for section capacity checks, which control in this case.

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-14 - Shear Capacity Combined Stresses.STD` is typically installed with the program.

V. CSA S16-14 - Short Column Compression

Determine the factored compressive resistance of a short column.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 4.1

Related Links

- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1447)

Problem

A W250x73 section is used for a pedestal with a height of 1.1 m.

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (FYLD)

Calculations

The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Local Element Buckling

Evaluate the slenderness effects of the column web:

$$\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8$$

Evaluate the slenderness effects of the column flanges:

$$\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7$$

Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

Column Capacity

Assume K = 1.0,

$$\frac{L}{r_x} = \frac{1,\ 100}{110} = 10$$

$$\frac{L}{r_y} = \frac{1,\ 100}{64.6} = 17$$

The largest slenderness ration controls, thus the slenderness factor for buckling about the minor axis:

$$\lambda = \left(\frac{KL}{r}\right)_{max} \sqrt{\frac{F_y}{\pi^2 E}} = 17\sqrt{\frac{350}{\pi^2 200,\ 000}} = 0.227$$

When n = 1.34 (Group 2 W shape),

$$C_r = \phi A F_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9,\ 280 \times 350\left[1 + 0.227^{(2\times1.34)}\right]^{-1/1.34} = 2.883 \times (10)^6 \text{ N} = 2,\ 883 \text{ kN}$$

Comparison

Table 618: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
KL/r, major	10	9.968	negligible
KL/r, minor	17	17.012	negligible
λ, critical	0.227	0.224	1.3%
C_r (kN)	2,883	2,884.358	negligible

V. CSA S16-14 - Slender Column Compression

Determine the factored compressive resistance of a slender column.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 4.2

Related Links

- *D4.E. Canadian Codes - Steel Design per CAN/CSA-S16-09/14/19* (on page 1447)

Problem

A W250x73 section is used for a pedestal with a height of 11.0 m.

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (FYLD)

Calculations

The nominal yield strength is used for the actual yield strength for a Group 2 section, per Table 3 and Table 4 of Appendix A of the reference.

Local Element Buckling

Evaluate the slenderness effects of the column web:

$$\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8$$

Evaluate the slenderness effects of the column flanges:

$$\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7$$

Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

Column Capacity

Assume K = 1.0,

$$\frac{L}{r_x} = \frac{11,000}{110} = 100$$

$$\frac{L}{r_y} = \frac{11,\ 000}{64.6} = 170$$

The largest slenderness ration controls, thus the slenderness factor for buckling about the minor axis:

$$F_e = \frac{\pi^2 \times 200,\ 000}{(1.0 \times 170)^2} = 68.3 \text{ kN}$$

$$\lambda = \sqrt{\frac{F_y}{F_e}} = \sqrt{\frac{350}{68.3}} = 2.26$$

When n = 1.34 (Group 2 W shape),

$$C_r = \phi A F_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9,\ 280 \times 350\left[1 + 2.26^{(2 \times 1.34)}\right]^{-1/1.34} = 0.529 \times (10)^6 \text{ N} = 529 \text{ kN}$$

Comparison

Table 619: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
KL/r, major	100	99.684	negligible
KL/r, minor	170	170.118	negligible
λ, critical	2.26	2.237	1.0%
C_r (kN)	529	538.161	1.7%

V. CSA S16-14 - Wide Flange Capacity Combined Stresses

Check the capacity of a wide-flange column under combined stresses.

Reference

Kulak, G.L. and G.Y. Grondin. 2010. *Limit States Design in Structural Steel*. 9th Edition. Markham, ON:CISC. Example 8.5

Problem

The W250x73 column has the following concentrated loads applied at the top of the column:

$C_f = 900$ kN

$M_{fx} = 180$ kN·m

The material used is G40.21 350W steel ($F_y = 350\ MPa$) (`FYLD`). The column is assumed to be braced laterally against lateral-torsional buckling (`LAT 1`).

L = 3.6 m

Calculations

Local Element Buckling

Evaluate the slenderness effects of the column web:

$$\frac{h}{w} = \frac{225}{8.6} = 26.2 < \frac{670}{\sqrt{350}} = 35.8$$

Evaluate the slenderness effects of the column flanges:

$$\frac{b}{2t} = \frac{254}{2 \times 14.2} = 8.9 < \frac{200}{\sqrt{350}} = 10.7$$

Both the column web and flanges are less than the local buckling limit, so the capacity of the column is evaluated using Eq. 4.21.

Axial Capacity

Determine the buckling load of the column, assuming that weak axis bucking will not control due to bracing:

$$\left(\frac{KL}{r}\right)_x = \frac{1.0(3,\ 600)}{110} = 32.7$$

The largest slenderness ratio controls:

$$F_{ex} = \frac{\pi^2 E}{\left(\frac{KL}{r}\right)_x^2} = \frac{\pi^2(200,\ 000)}{(32.7)^2} = 1,\ 847 \text{ kN}$$

$$\lambda = \sqrt{\frac{F_y}{F_{ey}}} = \sqrt{\frac{350}{1,\ 847}} = 0.435$$

$$C_r = \phi A F_y \left(1 + \lambda^{2n}\right)^{-1/n} = 0.90 \times 9,\ 280 \times 350\left[1 + 0.435^{(2 \times 1.34)}\right]^{-1/1.34} = 2,\ 716 \times (10)^6 \text{ N} = 2,\ 716 \text{ kN}$$

Moment Modifier

$$\kappa = \text{-}0/180 = 0$$

$$\omega_1 = 0.6 - 0.4\kappa = 0.6 \leq 1.0$$

Calculate the elastic buckling load for the bending axis:

$$C_e = \frac{\pi^2 \times 200,\ 000 \times 113 \times 10^6}{(1.0 \times 3,\ 600)^2} = 17,\ 211\text{kN}$$

$$U_{1x} = \frac{0.6}{1 - \left(\frac{900}{17,\ 210}\right)} = 0.633$$

Bending Capacity

From a previous example, the W250x73 is a Class 2 section. It is laterally supported along its length, thus:

$$M_{rx} = 0.9 \times 985 \times 10^3 \times 350 = 310 \text{ kN} \cdot \text{m}$$

Combined Stress Ratio

$$\frac{900}{2,\ 716} + \frac{0.85 \times 0.633 \times 180}{310} = 0.331 + 0.312 = 0.644 < 1.0$$

This is the check for overall member strength. However, there is another case that actually controls in this instance: checking for cross sectional strength.

$$C_r = 0.9 \times 9{,}280 \times 350 = 2{,}923 \text{ kN}$$

$$U_{1x} = 1.0$$

$$\frac{900}{2,\ 923} + \frac{0.85 \times 1.0 \times 180}{310} = 0.308 + 0.494 = 0.801 < 1.0$$

Comparison

Table 620: Comparison of results

Criteria	Reference	STAAD.Pro	Difference
$(KL/r)_x$	33	32.624	negligible
$(KL/r)_y$	56	55.675	negligible
C_r (kN)	2,716	2,715.935	negligible
C_e (kN)	17,211	17,600	2.3%
Stress Ratio	0.644	0.643	none
Stress Ratio (Critical)	0.801	0.801	none

Note: Both the reference and hand calculations agree with the STAAD.Pro results that the section is adequate. The reference however neglects to account for section capacity checks, which control in this case.

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-14 - Wide Flange Capacity Combined Stresses.STD` is typically installed with the program.

V. CSA S16-19 - Axial Comp and Bending Interaction

Check a wide flange column member subject to both axial compression and bending per the CSA S16-19 code.

References

Canadian Institute of Steel Construction. *Handbook of Steel Construction.* 9th Edition. 2008. Willowdale, Ont., pp. 6-52 - 6-53

Details

The column is simply supported and has a span of 3.6 m. The member is subjected to an axial load of 900 kN along with moments in both strong and weak directions of 50 kN·m at the roller end. The section used is a Canadian W250x73. The steel has a yield strength of 350 MPa (50 ksi) and ultimate strength of 450 MPa (65 ksi).

Section Properties

From the *Handbook of Steel Construction*:

$D = 253\ mm$
$B = 254\ mm$
$t_w = 8.6\ mm$
$t_f = 14.2\ mm$
$A = 9{,}280\ mm^2$
$I_x = 113\times(10)^6\ mm^4$
$I_y = 38.8\times(10)^6\ mm^4$
$S_x = 891\times(10)^3\ mm^3$

$S_y = 306\times(10)^3\ mm^3$
$Z_x = 985\times(10)^3\ mm^3$
$Z_y = 463\times(10)^3\ mm^3$
$r_x = 110\ mm$
$r_y = 64.6\ mm$
$C_w = 553\times(10)^9\ mm^6$
$J = 575\times(10)^3\ mm^4$

Material Properties

$E = 205{,}000\ MPa$
$G = 76{,}920\ MPa$

Calculations

Section Classification

$$b_{el} = B/2 = 127 \text{ mm}$$

$$h = D - 2\times t_f = 224.6 \text{ mm}$$

Compression section classification as per Table 1:

Flange classification:

$$b_{el}/t = {}^{127}\!/_{14.2} = 8.94 < \frac{200}{\sqrt{F_y}} = 10.69\text{, i.e. Class 1}$$

Web classification:

$$h\ /w = {}^{224.6}\!/_{8.6} = 26.11 < \frac{670}{\sqrt{F_y}} = 35.81\text{, i.e. Class 1}$$

Section is Class 1 for compression.

Flexural section classification as per Table 2

Flange classification (major and minor axes):

$$\frac{145}{\sqrt{F_y}} = 7.75 < b_{el}/t = {}^{127}\!/_{14.2} = 8.94 < \frac{170}{\sqrt{F_y}} = 9.09\text{, i.e. Class 2}$$

Web classification (major and minor axes):

$$h\ /w = {}^{224.6}\!/_{8.6} = 26.11 < \frac{525}{\sqrt{F_y}} = 28.06\text{, i.e. Class 1 } \textit{if} \text{ the condition } \frac{M_{fy}}{S_y} > \frac{0.9M_{fx}}{S_x}$$

$$\frac{M_{fy}}{S_y} = \frac{50}{306(10)^3} = 0.163(10)^{-3} > \frac{M_{fx}}{S_x} = \frac{50}{891(10)^3} = 0.051(10)^{-3}\text{, thus OK.}$$

Section is Class 2 for flexure.

Axial Compression Capacity

Check for axial compression per Cl. 13.3.1.1:

$$C_r = \frac{\phi A F_y}{\left(1 + \lambda^{2n}\right)^{1/n}} \qquad (13.3.1.1)$$

where

n = *1.34* for I sections

λ = $\sqrt{\frac{F_y}{F_e}}$

$$F_{ex} = \frac{\pi^2 E}{(KL_x / r_x)^2} = \frac{\pi^2 \times 205{,}000}{(1.0 \times 3{,}600 / 110)^2} = 1{,}890 \text{ MPa}$$

$$\lambda_x = \sqrt{\frac{350}{1{,}890}} = 0.430$$

$$C_{rx} = \frac{0.9 \times 9{,}280 \times 350}{\left[1 + 0.430^{(2\times1.34)}\right]^{1/1.34}} 10^{-3} = 2{,}715 \text{ kN}$$

$$F_{ey} = \frac{\pi^2 E}{(KL_y / r_y)^2} = \frac{\pi^2 \times 205{,}000}{(1.0 \times 3{,}600 / 64.6)^2} = 651 \text{ MPa}$$

$$\lambda_y = \sqrt{\frac{350}{651}} = 0.733$$

$$C_{ry} = \frac{0.9 \times 9{,}280 \times 350}{\left[1 + 0.733^{(2\times1.34)}\right]^{1/1.34}} 10^{-3} = 2{,}233 \text{ kN}$$

Check for flexural-torsional buckling per Cl. 13.3.1.2:

$$F_{ez} = \left[\frac{\pi^2 E C_w}{(KL_z)^2} + GJ\right]\frac{1}{A\bar{r}_0^2} \quad (13.3.1.2)$$

where

$\bar{r}_0^2$ = $x_0^2 + y_0^2 + r_x^2 + r_y^2$; since the section is doubly-symmetric, $x_0 = y_0 = 0$

$$\bar{r}_0^2 = (110)^2 + (64.6)^2 = 16{,}273 \text{ mm}^2$$

$$F_{ez} = \left[\frac{\pi^2 \times 205{,}000 \times 553 \times (10)^9}{(1.0 \times 3{,}600)^2} + 76{,}920 \times 575 \times (10)^3\right]\frac{1}{9{,}280 \times 16{,}273} = 865 \text{ MPa}$$

For flexural torsional buckling, F_e is the least of F_{ex}, F_{ey}, and F_{ez}. Therefore, $F_e = 651\ MPa$.

$$\lambda = 0.733$$

$$C_r = C_{ry} = 2{,}233 \text{ kN}$$

The critical ratio = C_f / C_r = 900 / 2,233 = 0.403

<u>Bending Capacity</u>

Check the bending capacity for a Class 2 section as per Cl. 13.5.a:

About major axis:

$$M_{px} = Z_x \times F_y = 985 \times (10)^3 \times 350 \times 10^{-6} = 344.8 \text{ kN}\cdot\text{m}$$

$$M_{rx} = \phi M_{px} = 0.9\ (344.8) = 310.3 \text{ kN}\cdot\text{m}$$

Ratio = M_{fx} / M_{rx} = 50 / 310.3 = 0.161

About minor axis:

$M_{py} = Z_y \times F_y = 463 \times (10)^3 \times 350 \times 10^{-6} = 162.1$ kN·m

$M_{ry} = \phi M_{py} = 0.9\ (162.1) = 145.8$ kN·m

Ratio = M_{fy} / M_{ry} = 50 / 145.8 = 0.343

<u>Combined Axial Compression & Bending</u>

Check cross-section strength for a Class 2 section per Cl. 13.8.2-a:

$$\frac{C_f}{C_r} + \frac{0.85 U_{1x} M_{fx}}{M_{rx}} + \frac{\beta U_{1y} M_{fy}}{M_{ry}} \le 1.0 \quad (13.8.2)$$

where

C_r = C_r as per Cl. 13.3 with the value of $\lambda = 0$ (Cl. 13.8.2-a-i), which reduces to:

$= \phi A F_y = 0.9 \times 9{,}280 \times 350 \times (10)^{-3} = 2{,}923$ kN

β = $0.6 + 0.4 \times \lambda_y \le 0.85$

$0.6 + 0.4\ (0.733) = 0.893$; thus limit $\beta = 0.85$

About both major and minor axes, the moment at the “start” joint, $M_A = 0$ and the moment at the “end” joint, $M_B = 50\ kN{\cdot}m$. Thus, $K = M_A\ /\ M_B = 0$.

$$\omega_1 = 0.6 - 0.4 \times K = 0.6 \quad (13.8.6)$$

$$U_1 = \frac{\omega_1}{1 - {C_f}/{C_e}} \ge 1.0 \quad (13.8.5\ \&\ 13.8.2\text{-a-iii})$$

where

C_e = $\dfrac{\pi^2 EI}{L^2}$

$$C_{ez} = \frac{\pi^2 E I_z}{L^2} = \frac{\pi^2 205{,}000 \times 113 \times (10)^3}{(3{,}600)^2} = 17{,}640 \text{ kN}$$

$$C_{ey} = \frac{\pi^2 E I_y}{L^2} = \frac{\pi^2 205{,}000 \times 38.8 \times (10)^3}{(3{,}600)^2} = 6{,}057 \text{ kN}$$

$$U_{1z} = \frac{0.6}{1 - {900}/{17{,}640}} 0.632 < 1.0$$

$$U_{1y} = \frac{0.6}{1 - {900}/{6{,}057}} 0.705 < 1.0$$

Thus, $U_1 = 1.0$ about both major and minor axes.

$$\frac{900}{2{,}923} + \frac{0.85 \times 1.0 \times (50)}{310.3} + \frac{0.85 \times 1.0 \times (50)}{145.8} = 0.736 \le 1.0$$

Check overall member strength for a Class 2 section per Cl. 13.8.2-b:

C_r used is taken from the axial compression calculations ($K = 1$).
Use U_{1z} and $U_{1y} = 1.0$ for an unbraced frame.

$$\frac{900}{2{,}233} + \frac{0.85 \times 1.0 \times (50)}{310.3} + \frac{0.85 \times 1.0 \times (50)}{145.8} = 0.831 \le 1.0$$

Check moment-only capacity for biaxial bending per Cl. 13.8.2-d:

$$\frac{M_{\mathrm{fz}}}{M_{\mathrm{rz}}} + \frac{M_{\mathrm{fy}}}{M_{\mathrm{ry}}} = \frac{50}{310.3} + \frac{50}{145.8} = 0.504 \leq 1.0$$

Comparison

Table 621: Comparison of results

Criteria	Reference	STAAD.Pro	Difference	Comments
Elastic buckling stress about the major axis, F_{ex} (MPa)	1,890	1,900.987	negligible

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-19 - Axial Comp and Bending Interaction.STD` is typically installed with the program.

The following D4.E.7 Design Parameters (on page 1458) are used:

- Full lateral support is specified using `LAT 1`.

- Steel strength values are specified using `FYLD 350000` and `FU 450000` (the units are kN/m^2 or kPa).

V. CSA S16-19 - Axial Tension

Determine the capacity of a member subject to axial tension load per the CSA S16-19 code.

Problem

A 4 m long member is subjected to a 630 kN tensile load. The section is a Canadian W100x19. The steel is grade 300W.

Section Properties

A_g = 2,480 mm^2

Material Properties

F_y = 300 MPa
F_u = 450 MPa

Calculations

Assume the gross area for both yielding and rupture limit states. Therefore, $A_{ne} = A_g = 2{,}480\ mm^2$.

$$T_r = \min\begin{cases}\phi A_g F_y = 0.9 \times 300 \times 2{,}480(10)^{-3} = 669.6\text{ kN}\\ \phi_u A_{ne} F_u = 0.75 \times 450 \times 2{,}480(10)^{-3} = 837\text{ kN}\end{cases}$$

So, the tensile capacity = $669.6\ kN$.

The critical stress ratio $630 / 669.6 = 0.941$.

Comparison

Table 622: Comparison of results

Criteria	Reference	STAAD.Pro	Difference	Comments
Yielding tension capacity, T_r (kN)	669.6	669.6	none	

Criteria	Reference	STAAD.Pro	Difference	Comments
Rupture tension capacity, T_r (kN)	837	837	none	
Critical Ratio	0.941	0.941	none	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-19 - Axial Tension.STD` is typically installed with the program.

The following D4.E.7 Design Parameters (on page 1458) are used:

- The parameter `SNUG 0` is used for welded or pre-tenstioned bolts (i.e., no reduction for bolt holes)
- The default value of `NSF 1` is used for net section equal to the gross area.
- The default value of `SLF 1` is used for a shear lag factor of 1 (i.e., no shear lag in connection)

V. CSA S16-19 - Axial Tension and Bending Interaction

Determine the capacity of a member subject to axial tension and biaxial moment per the CSA S16-19 code.

Problem

A 3.6 m long column is subjected to a 900 kN tensile load along with concentrated moments of 50 kN·m about both major and minor axes at one end. The section is a Canadian W250x73. The steel is grade 350W.
Section Properties

D = 253 mm
B = 254 mm
t_w = 8.6 mm
t_f = 14.2 mm

A_g = 9,280 mm^2
Z_x = 985,000 mm^3
Z_y = 463,000 mm^3

Material Properties

F_y = 350 MPa
F_u = 450 MPa

Calculations

Section Classification

Compression section classification per Table 1:

$$b_{el} = B / 2 = 127 \text{ mm}$$

$$h = D - 2 \times t_f = 235.8 \text{ mm}$$

- Flange classification:

$$\frac{b_{el}}{t} = \frac{127}{14.2} = 8.94 < \frac{200}{\sqrt{F_y}} = \frac{200}{\sqrt{350}} = 10.69$$

- Web classification:

$$\frac{h}{w} = \frac{235.8}{8.6} = 27.42 < \frac{670}{\sqrt{F_y}} = \frac{670}{\sqrt{350}} = 35.81$$

Therefore, the section is Class 1 for compression.

Flexure section classification per Table 2:

- Flange classification about major axis:

$$\frac{145}{\sqrt{F_y}} = 7.75 < \frac{b_{el}}{t} = \frac{127}{14.2} = 8.94 < \frac{170}{\sqrt{350}} = 9.09$$

  Class 2
- Flange classification about minor axis:

$$\frac{145}{\sqrt{F_y}} = 7.75 < \frac{b_{el}}{t} = \frac{127}{14.2} = 8.94 < \frac{170}{\sqrt{350}} = 9.09$$

  Class 2
- Web classification about major axis:

$$\frac{h}{w} = \frac{235.8}{8.6} = 27.42 < \frac{1{,}100}{\sqrt{F_y}} = 58.8$$

  Class 1
- Web classification about minor axis:

$$\frac{h}{w} = \frac{235.8}{8.6} = 27.42 < \frac{1{,}100}{\sqrt{F_y}} = 58.8$$

  Class 1

Therefore, the section is Class 2 for flexure.

Axial Tension

Assume the gross area for both yielding and rupture limit states. Therefore, $A_{ne} = A_g = 9{,}280\ mm^2$.

$$T_r = \min \begin{cases} \phi A_g F_y = 0.9 \times 350 \times 9{,}280(10)^{-3} = 2{,}923 \text{ kN} \\ \phi_u A_{ne} F_u = 0.75 \times 450 \times 9{,}280(10)^{-3} = 3{,}132 \text{ kN} \end{cases}$$

So, the tensile capacity = $2{,}923\ kN$.

The critical stress ratio $900\ /\ 2{,}923 = 0.308$.

Bending Capacity

For a Class 2, doubly symmetric section, the capacity is determined by Cl. 13.5a:

Major axis:

$$M_{px} = Z_x \times F_y = 985{,}000 \times 350\ (10)^{-6} = 344.8 \text{ kN·m}$$

$$M_{rx} = \phi M_{px} = 0.9 \times 344.8 = 310.3 \text{ kN·m}$$

The ratio = $50\ /\ 310.3 = 0.161$

Minor axis:

$$M_{py} = Z_y \times F_y = 463{,}000 \times 350\ (10)^{-6} = 162.1 \text{ kN·m}$$

$$M_{rx} = \phi M_{px} = 0.9 \times 162.1 = 145.8 \text{ kN·m}$$

The ratio = $50\ /\ 145.8 = 0.343$

Combined Axial Tension and Bending

Check for axial tension and bending per Cl. 13.9.2:

$$\frac{T_f}{T_r} + 0.85\frac{M_{fx}}{M_{rx}} + 0.6\frac{M_{fy}}{M_{ry}} = 0.380 + 0.85\left(0.161\right) + 0.6\left(0.343\right) = 0.651 < 1.0$$

Also, the following must be satisfied:

$$\frac{M_{fx}}{M_{rx}} + \frac{M_{fy}}{M_{ry}} = 0.161 + 0.343 = 0.504 < 1.0$$

Comparison

Table 623: Comparison of results

Criteria	Reference	STAAD.Pro	Difference	Comments
Nominal flexure capacity about major axis, M_{px} (kN·m)	344.8	345	negligible	
Ultimate flexure capacity about major axis, M_{rx} (kN·m)	310.3	310.3	none	

Criteria	Reference	STAAD.Pro	Difference	Comments
Nominal flexure capacity about minor axis, M_{py} (kN·m)	162.1	162	negligible	
Ultimate flexure capacity about minor axis, M_{rx} (kN·m)	145.8	145.8	none	
Tension capacity, T_r (kN)	2,932	2,930	negligible	
Critical Ratio	0.651	0.651	none	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-19 - Axial Tension and Bending Interaction.STD` is typically installed with the program.

The following D4.E.7 Design Parameters (on page 1458) are used:

- The default value of `NSF 1` is used for net section equal to the gross area.
- The default value of `SLF 1` is used for a shear lag factor of 1 (i.e., no shear lag in connection)

V. CSA S16-19 - Beam Shear Capacity

Check a the shear capacity of a wide flange beam per the CSA S16-19 code

References

1. Canadian Institute of Steel Construction. *Handbook of Steel Construction.* 9th Edition. 2008. Willowdale, Ont., pp.6-46 - 6-47
2. American Institute of Steel Construction, *Steel Construction Manual*. 15th Edition, American Institute of Steel Construction, 2017 p.3-213 & p.3-222
3. American Institute of Steel Construction, *Specification for Structural Steel Buildings.* AISC 360-16, American Institute of Steel Construction, 2016

Details

The beam is an 11 m long, simply-supported span. The member is subject to a uniform load of 40.033 kN/m along the length and a concentrated load of 352.27 kN at 55 mm before the right support. The member is also subjected to concentrated moments of 540 kN·m at the left support and -185 kN·m at the right support.

Assume that the web is stiffened at supports and that the member is laterally unsupported. Assume loads are factored.

The section used is a Canadian W530x82. The steel has a yield strength of 350 MPa (50 ksi) and ultimate strength of 450 MPa (65 ksi).

Section Properties

$d = 528\ mm$
$b = 209\ mm$
$t_f = 13.3\ mm$
$t_w = 9.5\ mm$
$I_y = 20.3\times(10)^6\ mm^4$
$Z_x = 2{,}060\ mm^3$
$J = 518\times(10)^3\ mm^4$
$C_w = 1{,}340\times(10)^9\ mm^6$

Material Properties

$E = 205{,}000\ MPa$
$G = 76{,}920\ MPa$

Calculations

Design Forces

Shear at the right end:

$$V_f = 352.27\left(\frac{10.945}{11}\right) + \frac{1}{2}(40.033 \times 11) + \frac{185 - 540}{11} = 350.5 + 220.2 - 49.1 = 538.4\text{ kN}$$

Moment at point of maximum shear (right end):

$$M_f = 185\text{ kN}\cdot\text{m}$$

Maximum moment (at left end):

$$M_{max} = 540\text{ kN}\cdot\text{m}$$

Moment at quarter points of span (for calculating moment gradient coefficient), calculated per Table 3-23 in the AISC *Steel Construction Manual*:

$$M_a = \frac{40.033(2.75)}{2}(11 - 2.75) + \left(\frac{540 - 185}{11}\right)2.75 - 540 + \frac{352.27(2.75)(0.055)}{11} = 7.7\text{ kN}\cdot\text{m}$$

$$M_b = \frac{40.033(5.5)}{2}(11 - 5.5) + \left(\frac{540 - 185}{11}\right)5.5 - 540 + \frac{352.27(5.5)(0.055)}{11} = 252.7\text{ kN}\cdot\text{m}$$

$$M_c = \frac{40.033(8.25)}{2}(11 - 8.25) + \left(\frac{540 - 185}{11}\right)8.25 - 540 + \frac{352.27(8.25)(0.055)}{11} = 194.9\text{ kN}\cdot\text{m}$$

Shear Capacity

Along major axis:

Web depth, $h = d - 2\times t_f = 528 - 2\times 13.3 = 501\ mm$

$$V_r = \phi A_w F_s \qquad (13.4.1.1)$$

where

A_w = area of the web, = $d \times t_w = 528 \times 9.5 = 5{,}016\ mm^2$
F_s = the shear stress capacity.

a = 11,000 mm (distance between stiffeners)

a/h = 11,000 / 501 = 21.9 > 1.0

The shear buckling coefficient, $k_v = 5.34 + 4\ /\ (a/h)^2 = 5.348$

$$\frac{h}{t_w} = \frac{501}{9.5} = 52.8 < 439\sqrt{\frac{k_v}{F_y}} = 439\sqrt{\frac{5.348}{350}} = 54.3$$

Therefore, $F_s = 0.66F_y = 0.66\ (350) = 231\ MPa$

$$V_r = 0.9 \times 5{,}016 \times 231\ (10)^{-3} = 1{,}043\ \text{kN}$$

The ratio along the major axis = $V_f\ /\ V_r = 538.4\ /\ 1{,}043 = 0.516$

Along minor axis: CSA S16-19 does not directly address the case of shear along the minor axis. Therefore, the method used in AISC 360-16 section G7. is used.

$$A_w = 2 \times b \times t_f = 2\ (209)\ (13.3) = 5{,}559\ \text{mm}^2$$

$$k_v = 1.2$$

$$\frac{h}{t_w} = \frac{b}{t_f} = \frac{209}{13.3} = 15.7 < 1.10\sqrt{\frac{k_v E}{F_y}} = 1.10\sqrt{\frac{1.2 \times 205{,}000}{350}} = 29.2$$

Therefore, $C_v = 1.0$.

$$V_r = \phi\ 0.6A_w F_y C_v = 0.9 \times 5{,}559 \times 350 \times 1.0\ (10)^{-3} = 1{,}051\ \text{kN}$$

<u>Bending Capacity</u>

Calculate the bending capacity per Cl. 13.6.1:

$$M_p = Z_x F_y = 2{,}060 \times 350 \times 10^{-3} = 721\ \text{kN·m}$$

$$M_u = \frac{\omega_2 \pi}{L}\sqrt{EI_y GJ + \left(\frac{\pi E}{L}\right)^2 I_y C_w} \qquad (13.6.1)$$

where

$$\omega_2 = \frac{4M_{max}}{\sqrt{M_{max}{}^2 + 4M_a{}^2 + 7M_b{}^2 + 4M_c{}^2}} = \frac{4(540)}{\sqrt{(540)^2 + 4(7.7)^2 + 7(252.7)^2 + 4(194.9)^2}} = 2.29 < 2.5$$

$$M_u = \frac{2.29 \times \pi}{11{,}000}\sqrt{205{,}000 \times \left(20.3 \times 10^6\right) \times (76{,}920) \times \left(518 \times 10^3\right) + \left(\frac{\pi \times 205{,}000}{11{,}000}\right)^2 \left(20.3 \times 10^6\right) \times \left(1{,}340 \times 1\right.}$$

$$= \frac{1}{1{,}530}\sqrt{165.8(10)^{21} + 93.24(10)^{21}} = 332.7\ \text{kN·m}$$

$$M_u < 0.67M_p = 0.67\ (721) = 483.1\ \text{kN·m}$$

Therefore, $M_r = \phi M_u = 0.9\ (\ 332.7) = 299.4\ kN{\cdot}m$

<u>Shear and Bending Interaction</u>

$$F_s = 231 > 0.60 \times F_y = 210\ \text{MPa}$$

Calculate the reduction factor for shear capacity due to combined shear and moment per Cl. 14.6:

$$\left[2.20 - 1.60\frac{M_f}{M_r}\right] = \left[2.20 - 1.60\frac{185}{299.4}\right] = 1.21 \tag{14.6}$$

Therefore, no reduction in the shear capacity to combined effects of bending and shear:

$$V_r = 1{,}043 \text{ kN}$$

Ratio = V_f / V_r = 538.4 / 1,043 = 0.516

Comparison

Table 624: Comparison of results

Criteria	Reference	STAAD.Pro	Difference	Comments
Shear buckling coefficient, k_v	5.348	5.349	negligible	
Elastic shear stress capacity, F_s (MPa)	231	231	none	
Factored shear capacity along major axis, V_{ry} (kN)	1,043	1,040	negligible	
Shear ratio along major axis	0.516	0.516	none	
Factored shear capacity along minor axis, V_{rz} (kN)	1,051	1,050	negligible	
Factored shear capacity modified for shear and moment interaction, V_r (kN)	1,043	1,043	none	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-19 - Beam Shear Capacity.STD` is typically installed with the program.

The following D4.E.7 Design Parameters (on page 1458) are used:

- Steel strength values are specified using `FYLD 350000` and `FU 450000` (the units are kN/m^2 or kPa).

V. CSA S16-19 - Cantilever Beam with Point Load

Determine the capacity of a cantilever beam subject to a point load per the CSA S16-19 code.

Details

A 7.5 m long cantilever member is subjected to load at the free end of 5 kN. The section is a Canadian W310x52. The steel is grade 350W. The section is unbraced along the length.

Section Properties

D = 318 mm
B = 167 mm
t_w = 7.6 mm
t_f = 13.2 mm
A_g = 9,280 mm^2
Z_x = 841,000 mm^3
Z_y = 189,000 mm^3
I_y = 1,030,00 mm^4
J = 308,000 mm^4
C_w = 238×10^9 mm^6

Material Properties

F_y = 350 MPa
F_u = 450 MPa

Validation

Section Classification

$$b_{el} = B / 2 = 83.5 \text{ mm}$$

$h = D - 2 \times t_f = 291.6$ mm

$C_f = 0$ (no compression force)

Flexure section classification per Table 2 of CSA S16-19:

- Flange classification about major axis:

$$\frac{b_{el}}{t_f} = \frac{83.5}{13.2} = 6.33 < \frac{145}{\sqrt{F_y}} = \frac{145}{\sqrt{350}} = 7.75$$

  Class 1

- Flange classification about minor axis:

$$\frac{b_{el}}{t_f} = \frac{83.5}{13.2} = 6.33 < \frac{145}{\sqrt{F_y}} = \frac{145}{\sqrt{350}} = 7.75$$

  Class 1

- Web classification about major axis:

$$\frac{h}{t_w} = \frac{291.6}{7.6} = 38.67 < \frac{1{,}100}{\sqrt{F_y}}\left(1 - 0.39\frac{C_f}{\phi C_y}\right) = 58.8$$

  Class 1

- Web classification about minor axis:

$$\frac{h}{t_w} = \frac{291.6}{7.6} = 38.67 < \frac{1{,}100}{\sqrt{F_y}}\left(1 - 0.39\frac{C_f}{\phi C_y}\right) = 58.8$$

  Class 1

Therefore, the section is Class 1 for flexure.

<u>Bending Capacity</u>

$$M_{fx} = 5 \times 7.5 = 37.5 \text{ kN·m}$$

For a Class 1, doubly symmetric section, the capacity is determined by Cl. 13.5:

Major axis:

$$M_{px} = Z_x \times F_y = 841{,}000 \times 350\ (10)^{-6} = 294.4 \text{ kN·m}$$

$$M_{rx} = \phi M_{px} = 0.9 \times 294.4 = 264.9 \text{ kN·m}$$

The ratio = *37.5 / 264.9 = 0.142*

Minor axis:

$$M_{py} = Z_y \times F_y = 189{,}000 \times 350\ (10)^{-6} = 66.2 \text{ kN·m}$$

$$M_{rx} = \phi M_{px} = 0.9 \times 66.2 = 59.5 \text{ kN·m}$$

Check for lateral-torsional buckling per Cl. 13.6.h i).

$$M_u = \omega_2 C_H C_B \frac{\sqrt{E I_y G J}}{L_c}$$

where

$$X = \frac{\pi}{L_c}\sqrt{\frac{E C_w}{GJ}} = \frac{\pi}{7{,}500}\sqrt{\frac{205{,}000 \times 238(10)^9}{76{,}920 \times 308{,}000}} = 0.601$$

$0.5 \leq X \leq 2.3$ for a point load

ω_2 = $3.95 + 3.52\ X = 3.95 + 3.52\ (0.601) = 6.07$

C_H = $0.76 - 0.51\ X + 0.13\ X^2 = 0.76 - 0.51\ (0.601) + 0.13\ (0.601)^2 = 0.50$

C_B = 1.0

$$M_u = 6.07(0.50)(1.0)\frac{\sqrt{205{,}000 \times 1{,}030{,}000 \times 76{,}920 \times 308{,}000}}{7{,}500 \times (10)^6} = 90.5\ \text{kN·m}$$

$$0.67 \times M_p = 0.67\ (294.4) = 197.2\ \text{kN·m} > M_u$$

$$M_r = \phi M_u = 0.9 \times 90.52 = 81.5\ \text{kN·m}$$

The ratio = $37.5\ /\ 81.5 = 0.46$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
M_{px} (kN·m)	294.4	294	negligible

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-19 - Cantilever Beam with Point Load.STD` is typically installed with the program.

The following D4.E.7 Design Parameters (on page 1458) are used:

- The unbraced cantilever is specified using `CAN 1`.
- The load acts on the tension side of the bending member, thus `LHT 1`.

V. CSA S16-19 - Check for Bending and LTB

Determine the capacity of a laterally unbraced beam subject to bending moment per the CSA S16-19 code.

Problem

A 7.5 m long, simply supported beam is subjected to a distributed load of 12 kN/m. The section is a Canadian W310x52. The steel is grade 350W.

Section Properties

$D = 318$ mm
$B = 167$ mm
$t_w = 7.6$ mm
$t_f = 13.2$ mm
$Z_x = 841{,}000\ mm^3$
$Z_y = 189{,}000\ mm^3$
$I_y = 10.3\times10^6\ mm^4$

$J = 308{,}000\ mm^4$
$C_w = 238\times10^9\ mm^6$

Material Properties

$F_y = 350$ MPa
$F_u = 450$ MPa
$E = 205{,}000$ MPa
$G = 76{,}920$ MPa

Calculations

Section Classification

$$b_{el} = B / 2 = 83.5 \text{ mm}$$

$$h = D - 2\times t_f = 291.6 \text{ mm}$$

Flexure section classification per Table 2:

- Flange classification about major axis:

$$\frac{b_{\text{el}}}{t} = \frac{83.5}{13.2} = 6.33 < \frac{145}{\sqrt{F_y}} = 7.75$$

Class 1

- Flange classification about minor axis:

$$\frac{b_{\text{el}}}{t} = \frac{83.5}{13.2} = 6.33 < \frac{145}{\sqrt{F_y}} = 7.75$$

Class 1

- Web classification about major axis:

$$\frac{h}{w} = \frac{291.6}{7.6} = 38.37 < \frac{1,100}{\sqrt{F_y}} = 58.8$$

Class 1

- Web classification about minor axis:

$$\frac{h}{w} = \frac{291.6}{7.6} = 38.37 < \frac{1,100}{\sqrt{F_y}} = 58.8$$

Class 1

Therefore, the section is Class 1 for flexure.

Bending Capacity

$$M_{\text{fx}} = \frac{12(7.5)^2}{8} = 84.4 \text{ kN·m}$$

For a Class 2, doubly symmetric section, the capacity is determined by Cl. 13.5a:

Major axis:

$$M_{px} = Z_x \times F_y = 841{,}000 \times 350\ (10)^{-6} = 294.4 \text{ kN·m}$$

$$M_{rx} = \phi M_{px} = 0.9 \times 294.4 = 264.9 \text{ kN·m}$$

The ratio = *84.4 / 264.9 = 0.318*

Minor axis:

$$M_{py} = Z_y \times F_y = 189{,}000 \times 350\ (10)^{-6} = 66.2 \text{ kN·m}$$

$$M_{rx} = \phi M_{px} = 0.9 \times 66.2 = 59.5 \text{ kN·m}$$

Lateral Torsional Buckling

Check for lateral torsional buckling per Cl. 13.6:

$$M_u = \frac{\omega_2 \pi}{L}\sqrt{EI_yGJ + \left(\frac{\pi E}{L}\right)^2 I_y C_w} < 0.67 \times M_p$$

where

ω_2	=	1.0
EI_yGJ	=	$205{,}000 \times 10.3(10)^6 \times 76{,}920 \times 308{,}000 = 50.02\ (10)^{21}$
$\left(\frac{\pi E}{L}\right)^2 I_y C_w$	=	$\left(\frac{\pi \times 205{,}000}{7{,}500}\right)^2 10.3(10)^6 238(10)^9 = 18.08(10)^{21}$

$$\frac{(1.0)\pi}{7{,}500}\sqrt{50.02(10)^{21} + 18.08(10)^{21}} = 109.3(10)^6 \text{ N·mm} = 109.3 \text{ kN·m}$$

$$109.3 < 0.67\ (294.4) = 197.2$$

$$M_r = \phi M_u = 0.9 \times 109.3 = 98.38 \text{ kN·m}$$

Ratio = *84.4 / 98.38 = 0.858*.

Comparison

Table 625: Comparison of results

Criteria	Reference	STAAD.Pro	Difference	Comments
Nominal flexure capacity about major axis, M_{px} (kN·m)	294.4	294	negligible	
Ultimate flexure capacity about major axis, M_{rx} (kN·m)	264.9	264.9	none	
Nominal flexure capacity about minor axis, M_{py} (kN·m)	66.2	66.2	none	
Ultimate flexure capacity about minor axis, M_{rx} (kN·m)	59.5	59.54	negligible	
Ratio	0.318	0.318	none	
Nominal lateral torsional bending capacity, M_u (kN)	109.3	109.3	none	
Ultimate lateral torsional bending capacity, M_r (kN)	98.38	98.38	none	
Critical Ratio	0.858	0.858	none	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-19 - Check for Bending and LTB.STD` is typically installed with the program.

The following D4.E.7 Design Parameters (on page 1458) are used:

- The laterally unsupported is designated by the parameter `LAT 0`.

- The value of ω_2 is specified as 1 using the parameter `CB 1`

V. CSA S16-19 - CLASS4 UPT Cantilever Beam with UDL

Determine the capacity of a cantilever beam using a user-provided section subject to a distributed load per the CSA S16-19 code.

Details

A 7.5 m long cantilever member is subjected to uniformly distributed load of 1 kN. The section is an I shape with 300 mm × 15 mm flanges and a 420 mm × 15 mm web. The compression flange is laterally unbraced along the length.

Material Properties

$F_y = 650$ MPa

Validation

Section Properties

$D = 420 + 15 + 15 = 450$ mm

$A_g = 2×(300 × 15) + 420 × 15 = 15{,}300 \text{ mm}^2$

$$I_x = 2\left[\frac{300(15)^3}{12} + 300 \times 15\left(\frac{420 + 15}{2}\right)^2\right] + \frac{15(420)^3}{12} = 518.5(10)^6\ mm^4$$

$$I_y = 2\left[\frac{15(300)^3}{12}\right] + \frac{420(15)^3}{12} = 67{,}620{,}000\ mm^4$$

$$S_x = \frac{518.5(10)^6 2}{450} = 2{,}305{,}000\ mm^3$$

$$S_y = \frac{67{,}620{,}000(2)}{300} = 450{,}800\ mm^3$$

$$J = \frac{1}{3}\left[2 \times 300(15)^3 + 420(15)^3\right] = 1{,}148{,}000\ mm^4$$

$$C_w = \frac{(420 + 15)^2 (300)^3 15}{24} = 3{,}193(10)^9\ mm^6$$

<u>Section Classification</u>

$b_{el} = B / 2 = 150$ mm

$C_f = 0$ (no compression force)

Flexure section classification per Table 2 of CSA S16-19:

- Flange classification about major axis:

  $$\frac{b_{el}}{t_f} = \frac{150}{15} = 10 > \frac{200}{\sqrt{F_y}} = \frac{200}{\sqrt{650}} = 7.84$$

  Class 4
- Flange classification about minor axis:

  $$\frac{b_{el}}{t_f} = \frac{150}{15} = 10 < \frac{340}{\sqrt{F_y}} = \frac{340}{\sqrt{650}} = 13.36$$

  Class 3
- Web classification about major axis:

  $$\frac{h}{t_w} = \frac{420}{15} = 28 < \frac{1{,}100}{\sqrt{F_y}}\left(1 - 0.39\frac{C_f}{\phi C_y}\right) = 58.8$$

  Class 1
- Web classification about minor axis:

  $$\frac{h}{t_w} = \frac{420}{15} = 28 < \frac{1{,}100}{\sqrt{F_y}}\left(1 - 0.39\frac{C_f}{\phi C_y}\right) = 58.8$$

  Class 1

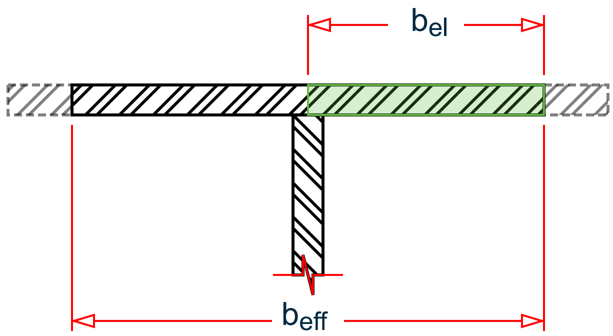
Therefore, the section is Class 4 for flexure.

<u>Bending Capacity</u>

$$M_{fx} = \frac{1.0(7.5)^2}{2} = 28.1\ \text{kN}\cdot\text{m}$$

For a Class 4, doubly symmetric section, the capacity is determined by Cl. 13.5.c. In this case, the compression flange is Class 4 but the web is Class 3, so Cl. 13.5.c.iii applies. Therefore, the effective section modulus, S_e, is used. The outstanding element length is limited to:

$$b_{el} = 200t / \sqrt{F_y} = 200 \times 15 / \sqrt{650} = 118\ \text{mm}$$



Therefore, $b_{eff} = 2\times b_{el} = 236\ mm$

$$I_{\mathrm{eff,x}} = 2\left[\frac{268(15)^3}{12} + 268\times 15\left(\frac{420+15}{2}\right)^2\right] + \frac{15(420)^3}{12} = 427.7(10)^6\ \mathrm{mm}^4$$

$$S_{\mathrm{eff,x}} = \frac{427.7(10)^6 2}{450} = 1{,}901{,}000\ \mathrm{mm}^3$$

Major axis:

$$M_{yx} = S_{eff,x}\times F_y = 1{,}901{,}000 \times 650\ (10)^{-6} = 1{,}236\ kN\cdot m$$

$$M_{rx} = \phi M_{yx} = 0.9 \times 1{,}236 = 1{,}112\ kN\cdot m$$

The ratio = *28.1 / 1,112 = 0.025*

Minor axis:

$$M_{yy} = S_y\times F_y = 450{,}800 \times 650\ (10)^{-6} = 293.0\ kN\cdot m$$

$$M_{ry} = \phi M_{yy} = 0.9 \times 293.0 = 263.7\ kN\cdot m$$

Check for lateral-torsional buckling per Cl. 13.6.h i).

$$M_u = \omega_2 C_H C_B \frac{\sqrt{EI_y GJ}}{L_c}$$

where

$$X = \frac{\pi}{L_c}\sqrt{\frac{EC_w}{GJ}} = \frac{\pi}{7{,}500}\sqrt{\frac{205{,}000\times 3{,}193(10)^9}{76{,}920\times 1{,}148{,}000}} = 1.142$$

$0.5 \le X \le 2.5$ for a distributed load

ω_2 = 5.38 + 8.71 X = 5.38 + 8.71 (1.142) = 15.77

C_H = $0.49 - 0.27\,X + 0.06\,X^2 = 0.49 - 0.27\,(1.142) + 0.06\,(1.142)^2 = 0.26$

C_B = $1.48 + 0.16\,X = .48 + 0.16\,(1.142) = 1.66$

$$M_u = 15.77(0.26)(1.66)\frac{\sqrt{205{,}000\times 67{,}620{,}000\times 76{,}920\times 1{,}148{,}000}}{7{,}500\times(10)^6} = 1{,}004\ \ kN\cdot m$$

$$0.67\times M_y = 0.67\ (1{,}236) = 827.8\ kN\cdot m < M_u$$

$M_r = 1.15\phi M_y[1 - 0.28\ M_y / M_u] = 1.15 \times 0.9 \times 1{,}236\ [\ 1 - 0.28\times(1{,}236 / 1{,}004)\ ] = 838.3$ kN·m

The ratio = *28.1 / 838.3 = 0.034*

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Canada\CSA S16-19 - CLASS4 UPT Cantilever Beam with UDL.STD` is typically installed with the program.

The following D4.E.7 Design Parameters (on page 1458) are used:

- The cantilever is braced along the tension flange only specified using `CAN 2`.
- The load acts on the tension side of the bending member, thus `LHT 1`.

V. CSA S16-19 - Short Column Compression

Determine the capacity of a short column per the CSA S16-19 code.

Problem

A Canadian W250x73 section is used for a pedestal with a height of 1.1 m. The axial load is 1,000 kN in compression. The steel is grade 350W.

<u>Section Properties</u>

$D = 253$ mm
$B = 254$ mm
$t_w = 8.6$ mm
$t_f = 14.2$ mm
$A_g = 9{,}280$ mm^2

$I_x = 113\times10^6$ mm^4

$I_y = 38.8\times10^6$ mm^4

$J = 575{,}000$ mm^4
$C_w = 553\times10^9$ mm^6

<u>Material Properties</u>

$F_y = 350$ MPa
$F_u = 450$ MPa
$E = 205{,}000$ MPa
$G = 76{,}920$ MPa

Calculations

<u>Section Classification</u>

$$b_{el} = B / 2 = 83.5 \text{ mm}$$

$$h = D - 2\times t_f = 291.6 \text{ mm}$$

Compression section classification per Table 1

- Flange classification:

$$\frac{b_{el}}{t} = \frac{127}{14.2} = 8.94 < \frac{200}{\sqrt{F_y}} = 10.69$$

- Web classification about major axis:

$$\frac{h}{w} = \frac{235.8}{8.6} = 27.4 < \frac{670}{\sqrt{F_y}} = 35.8$$

Therefore, the section is Class 1 for compression.

Column Capacity

$$r_x = \sqrt{I_x / A} = \sqrt{\frac{113 \times (10)^6}{9{,}280}} = 110.3 \text{ mm}$$

$$r_y = \sqrt{I_y / A} = \sqrt{\frac{38.8 \times (10)^6}{9{,}280}} = 64.7 \text{ mm}$$

Assume K = 1.0,

$$\frac{KL}{r_x} = \frac{1.0 \times 1{,}100}{110.3} = 9.97$$

$$\frac{KL}{r_y} = \frac{1.0 \times 1{,}100}{64.7} = 17.0$$

Elastic buckling stress:

$$F_{\text{ex}} = \frac{\pi^2 E}{\left(KL_x / r_x\right)^2} = \frac{\pi^2 \times 205{,}000}{(9.97)^2} = 20{,}360 \text{ MPa}$$

$$F_{\text{ey}} = \frac{\pi^2 E}{\left(KL_y / r_y\right)^2} = \frac{\pi^2 \times 205{,}000}{(17.0)^2} = 6{,}991 \text{ MPa}$$

$$\lambda_x = \sqrt{F_y / F_{\text{ex}}} = \sqrt{\frac{350}{20{,}360}} = 0.131$$

$$\lambda_y = \sqrt{F_y / F_{\text{ey}}} = \sqrt{\frac{350}{6{,}991}} = 0.224$$

Per Cl. 13.3.1, $n = 1.34$ (Group 2 W shape):

$$C_{\text{rx}} = \phi A F_y \left(1 + \lambda_x^{2n}\right)^{-1/n} = 0.90 \times 9{,}280 \times 350\left[1 + 0.131^{(2\times1.34)}\right]^{-1/1.34}(10)^{-3} = 2{,}914 \text{ kN}$$

$$C_{\text{ry}} = \phi A F_y \left(1 + \lambda_y^{2n}\right)^{-1/n} = 0.90 \times 9{,}280 \times 350\left[1 + 0.224^{(2\times1.34)}\right]^{-1/1.34}(10)^{-3} = 2{,}884 \text{ kN}$$

Flexural Torsional Buckling

$$r_o^2 = r_x^2 + r_y^2 + X^2 + Y^2 = (110.3)^2 + (64.7)^2 + 0 + 0 = 16{,}360 \text{ mm}^2$$

$$F_{\text{ez}} = \left[\frac{\pi^2 E C_w}{(K_z L_z)^2} + GJ\right]\frac{1}{A \times r_o^2}$$

$$= \left[\frac{\pi^2 \times 205{,}000 \times 553(10)^9}{(1{,}100)^2} + 76{,}920 \times 575{,}000\right]\frac{1}{9{,}280 \times 16{,}360} = 6{,}382 \text{ MPa}$$

Take the minimum of F_{ex}, F_{ey}, and F_{ez} as F_{FTB}:

$$F_{\text{FTB}} = F_{\text{ez}} = 6{,}382 \text{ MPa}$$

$$\lambda_{\mathrm{FTB}} = \sqrt{F_y / F_e} = \sqrt{\frac{350}{6{,}382}} = 0.234$$

$$C_{r,\mathrm{FTB}} = \phi A F_y \left(1 + \lambda_z{}^{2n}\right)^{-1/n} = 0.90 \times 9{,}280 \times 350\left[1 + 0.234^{(2\times1.34)}\right]^{-1/1.34}(10)^{-3} = 2{,}879\ \mathrm{kN}$$

Ratio = *1,000 / 2,879 = 0.347*

Comparison

Table 626: Comparison of results

Criteria	Reference	STAAD.Pro	Difference	Comments

V. China

V. GB500017-2017 Double Angle section with Axial Force

Verify the slenderness, strength, and stability of a double-angle section subject to axial force per GB50017-2017.

Reference

MOHURD. 2017. *GB 50017-2017 Standard for design of steel structures* . Beijing, China: Ministry of Housing and Urban-Rural Development

Problem

The section is a 2 x L100x100x7 SP 0 with a length of 3.005 m. The structure is a truss model. Member #32 assigned with double angle section (2 x L100x100x7 SP 0) is designed per GB 50017-2017. The governing load combination (#4) is 1.2 DL + 1.4 LL and the ultimate force on the member, N, is 416.2 kN of axial compression.

Material Properties

The material is Q235 type steel.

Design strength in tension, compression, and flexure: $f_y = 215\ MPa$
Design strength in shear: $f_v = 125\ MPa$

Section Properties

Side length, $b = h = 100\ mm$
Thickness, $t = 7\ mm$
Cross-sectional area, $A = 2{,}760\ mm^2$
Moment of inertia about x, $I_x = 2{,}631{,}000\ mm^4$
Moment of inertia about y, $I_y = 4{,}732{,}000\ mm^4$
Radius of gyration about x, $i_x = 30.87\ mm$
Radius of gyration about y, $i_y = 41.41\ mm$
Area moment about x, $S_x = 36{,}700\ mm^3$
Area moment about y, $S_x = 37{,}280\ mm^3$

Calculations

Slenderness Ratio

According to Table 7.4.1-1 of GB50017-2017, effective length of double angle is:

$$l_{ox} = l_x = 3{,}005 \text{ mm}$$

$$l_{oy} = l_y = 3{,}005 \text{ mm}$$

According to formula 7.2.1-1 and 2 of steel structures code, slenderness ratio of double angle with X axis and Y axis is:

$$\lambda_x = \frac{l_{0x}}{i_x} = \frac{3,005}{30.87} = 97.33$$

$$\lambda_y = \frac{l_{0y}}{i_y} = \frac{3,005}{41.41} = 72.57$$

According to formula 7.2.2-7 of steel structures code, torsional buckling equivalent slenderness ratio of double angle is:

$$\lambda_z = 3.9 \times \frac{b}{t} = 3.9 \times \frac{100}{7} = 55.71$$

Calculate the equivalent slenderness ratio of symmetry axis. Since $\lambda_y > \lambda_z$, the formula 7.2.2-5 should be used to get the λ_{yz}:

$$\lambda_{yz} = \lambda_y\left[1 + 0.16\left(\frac{\lambda_z}{\lambda_y}\right)^2\right] = 72.57 \times \left[1 + 0.16 \times \left(\frac{55.71}{72.57}\right)^2\right] = 79.42$$

The maximum slenderness ratio of the double-angle section, $\lambda_{max} = 97.33$

The limit of slenderness ratio of compression member is 150 according to table 7.4.6 of steel structures code.

$$\lambda_{\mathrm{max}} / \lambda_{\mathrm{limit}} = \frac{97.33}{150} = 0.65 < 1.0, \text{ Passed}$$

The limit of slenderness ratio of tension member is 300 according to table 7.4.7 of steel structures code.

$$\lambda_{\mathrm{max}} / \lambda_{\mathrm{limit}} = \frac{97.33}{300} = 0.32 < 1.0, \text{ Passed}$$

Tension or Compression Strength

According to formula 7.1.1-1 and 7.1.1-2 of steel structures code, the stress of double angle with gross cross-section area is:

$$\sigma = \frac{N}{A} = \frac{416.2\mathrm{kN}}{2,760\mathrm{mm}^2} = 150.8 \ \mathrm{kN} / \mathrm{mm}^2 < f = 215$$

And the ratio is:

$$\frac{\sigma}{f} = \frac{150.8}{215} = 0.70$$

The stress of double angle with net cross section area is:

$$\sigma = \frac{N}{A} = \frac{416.2\mathrm{kN}}{2,760\mathrm{mm}^2} = 150.8 \ \mathrm{kN} / \mathrm{mm}^2 < 0.7\mathrm{f}_u = 0.7 \times 370 = 259$$

And the ratio is:

$$\frac{\sigma}{0.7\mathrm{f}_u} = \frac{150.8}{259} = 0.58$$

Steel Grade Correction Factor

The steel type is Q235. According to note 1 in table 3.5.1 of *Standard for design of steel structures* and table 1 of *Standard for design of steel structures. Commentary 2.2*, the steel grade correction coefficient is $\varepsilon_k = 1$.

Compressive Strength

According to table 7.2.1-1 of steel structures code, the double angle section class is b.

The slenderness ratio of double angle on X axis, $\lambda_x = 97.33$. So,

$$\frac{\lambda}{\varepsilon_k} = \lambda_x = 97.33$$

$$\lambda_n = \frac{\lambda_x}{\pi}\sqrt{\frac{f_y}{E}} = \frac{97.33}{\pi}\sqrt{\frac{235}{206{,}000}} = 1.046$$

Class b, so, the coefficients are $a1 = 0.650$, $a2 = 0.965$, and $a3 = 0.300$.

Since $\lambda_n = 1.046 > 0.215$, then the stability factor in x:

$$\phi_x = \frac{1}{2\lambda_n^2}\left[\left(a_2 + a_3\lambda_n + \lambda_n^2\right) - \sqrt{\left(a_2 + a_3\lambda_n + \lambda_n^2\right)^2 - 4\lambda_n^2}\right]$$

$$= \frac{1}{2 \times 1.046^2}\left[\left(0.965 + 0.300 \times 1.046 + 1.046^2\right) - \sqrt{\left(0.965 + 0.300 \times 1.046 + 1.046^2\right)^2 - 4 \times 1.046^2}\right] = 0.572$$

The slenderness ratio of double angle on symmetry axis is $\lambda_{yz} = 79.42$. So,

$$\frac{\lambda}{\varepsilon_k} = \lambda_x = 79.42$$

$$\lambda_n = \frac{\lambda_{xy}}{\pi}\sqrt{\frac{f_y}{E}} = \frac{79.42}{\pi}\sqrt{\frac{235}{206{,}000}} = 0.854$$

Class b, so, the coefficients are $a1 = 0.650$, $a2 = 0.965$, and $a3 = 0.300$.

Since $\lambda_n = 1.046 > 0.215$, then the stability factor in xy:

$$\phi_{yz} = \frac{1}{2\lambda_n^2}\left[\left(a_2 + a_3\lambda_n + \lambda_n^2\right) - \sqrt{\left(a_2 + a_3\lambda_n + \lambda_n^2\right)^2 - 4\lambda_n^2}\right]$$

$$= \frac{1}{2 \times 0.854^2}\left[\left(0.965 + 0.300 \times 0.854 + 0.854^2\right) - \sqrt{\left(0.965 + 0.300 \times 0.854 + 0.854^2\right)^2 - 4 \times 0.854^2}\right] = 0.692$$

The minimum stability factor is 0.572.

From GB50017-2017 Clause 7.3.1-5, when $\lambda > 80\varepsilon_k$, the formula 7.3.1-7 should be used to get the value of width thickness ratio of compression member. Here, $97.33 > 80 \times 1$.

Limit value of width to thickness ratio = $5\varepsilon_k + 0.125\lambda = 5 + 0.125 \times 97.33 = 17.17$.

According to Clause 7.3.2 of GB50017-2017, $\phi Af = 0.572 \times 2{,}760 \times 215 = 339.4\ kN < N = 416.2\ kN$

Therefore, the limit value of width to thickness ratio without magnification.

According to formula 7.3.1-7 of GB50017-2017, $w = b - 2t = 100 - 2 \times 7 = 86\ mm$

$$\frac{w}{t} = \frac{86}{7} = 12.29 < 17.17$$

$$\frac{\text{Actual value}}{\text{Limit value}} = \frac{12.29}{17.17} = 0.72 < 1.0$$

The double angle members are composed of equilateral single angle. So, the check process of the height thickness ratio of compression web is consistent with that of width thickness ratio of compression flange. Thus, OK.

Stability of the compression member: according to formula (7.2.1) of GB50017-2017:

$$\frac{N}{\phi Af} = \frac{416{,}200}{0.572 \times 2{,}760 \times 215} = 1.23 > 1.0, \text{ Failed}$$

Shear Strength

According to formula (7.2.7) of GB50017-2017,

$$V = \frac{A \times f}{85\varepsilon_k} = \frac{2{,}760 \times 215}{85 \times 1} = 6{,}981 \text{ N}$$

Then, according to formula (6.1.3) of GB50017-2017,

$$\tau = \frac{VS}{It_w} = \frac{6{,}981 \times 36{,}700}{2{,}630{,}000 \times 14} = 6.957 \text{ N/mm}^2$$

Therefore, the ratio is:

$$\frac{\tau}{f_v} = \frac{6.957}{125} = 0.06$$

Comparison

Table 627: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comment
Compression Slenderness	0.64	0.65	none

V. GB500017-2017 H Section Subject to Bending

Verify the strength, stability, and deflection of an H section subject to bending per GB50017-2017.

Reference

MOHURD. 2017. *GB 50017-2017 Standard for design of steel structures* . Beijing, China: Ministry of Housing and Urban-Rural Development

Problem

The section is an HN500x200 with a length of 2.5 m. The structure is a two-story frame. Member #40 assigned with an H-section (HN500x200) is designed per GB 50017-2017. The section has an unbraced length of 1.0 m about the x direction and 2.5 m about the y direction.

Material Properties

The material is Q235 type steel.

Design strength in tension, compression, and flexure: $f_y = 215\ MPa$
Design strength in shear: $f_v = 125\ MPa$

Section Properties

Section depth, h = *500 mm*
Section width, b = *200 mm*
Flange thickness, t_f = *16 mm*
Web thickness, t_w = *10 mm*
Cross-sectional area, A = *11,225 mm²*
Moment of inertia about x, I_x = *468,110,000 mm⁴*
Moment of inertia about y, I_y = *21,380,000 mm⁴*
Radius of gyration about x, i_x = *204.2 mm*
Radius of gyration about y, i_y = *43.6 mm*
Area moment about x, S_x = *1,872,400 mm³*
Area moment about y, S_x = *213,800 mm³*

Calculations

Slenderness Ratio

The effective length is:

$$l_{oy} = l_y = 2{,}500 \text{ mm}$$

According to the formula (c.0.1-2) in Appendix C, the slenderness ratio is:

$$\lambda_y = \frac{l_{0y}}{i_y} = \frac{2{,}500}{43.6} = 57.3$$

Steel Grade Correction Factor

The steel type is Q235. According to note 1 in table 3.5.1 of *Standard for design of steel structures* and table 1 of *Standard for design of steel structures. Commentary 2.2*, the steel grade correction coefficient is $\varepsilon_k = 1$.

Overall Stability Coefficient

According to the formula (c.0.5-1) in Appendix C of *Standard for design of steel structures*, the overall stability coefficient of the beam determined by the bending around the strong axis is calculated as:

$$\phi_{bx} = \phi_b = 1.07 - \frac{\lambda_y^2}{44{,}000\varepsilon_k^2} = 1.07 - \frac{(57.3)^2}{44{,}000} = 0.995$$

Plastic Development Coefficient

According to clause 6.1.2 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3,

$$y_x = 1.05$$

$$y_y = 1.20$$

Check Web Thickness to Height Ratio

The calculated height of the web does not include the chamfering arc segment,

$$h_0 = 500 \text{ mm} - 2\times(16 \text{ mm}) = 468 \text{ mm}$$

$$\frac{h_0}{t_f} = \frac{468}{10} = 46.8$$

According to table 3.5.1 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3, so the limit value of height thickness ratio is:

$$93\varepsilon_k = 93$$

Ratio: $\frac{46.8}{93} = 0.50$

Check Flange Thickness to Width Ratio

The overhanging width of flange does not include chamfering arc segment,

$$b_0 = \frac{b - t_w}{2} = \frac{200 - 10}{2} = 95 \text{ mm}$$

$$\frac{b_0}{t_f} = \frac{95}{16} = 5.94$$

According to table 3.5.1 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3, so the limit value of width thickness ratio is:

$$13\varepsilon_k = 13$$

Ratio: $\frac{5.94}{13} = 0.46$

Check Overall Stability

The controlling load condition for the overall stability is combination 59. F : 1.35DL+0.84WF:

$$M_x = -111.2 \text{ kN·m}$$

$$M_y = 2.68 \text{ kN·m}$$

$$\frac{M_x}{\phi_{bx} W_x f} + \frac{M_y}{\gamma_y W_y f} \quad \text{(Cl. 6.2.3)}$$

$$\frac{-111.2(10)^6}{0.995 \times 1,872,400 \times 215} + \frac{2.67(10)^6}{1.2 \times 213,800 \times 215} = 0.33$$

Deflection

From the STAAD analysis, the maximum displacement of the beam is 5.8 mm. The total length of the physical beam member is 10 m.

$$\text{Deflection ratio } = \frac{5.8}{10,000} = 1 / 1,730$$

According to table B.1.1 of Appendix B of Standard for design of steel structures, the allowable deflection ratio is *1 / 400*.

$$\frac{1 / 1,730}{1 / 400} = 0.23$$

Equivalent Stress in Beam

The controlling load condition for equivalent stress is combination 56. F : 1.35DL+0.98LL+0.84WL:

$$M = -111.2 \text{ kN·m}$$

$$V = 43.3 \text{ kN}$$

According to clause 6.1.5 of *Standard for design of steel structures* and taking the top of web as the calculation point, the distance from calculated point to neutral axis of beam:

$$y_1 = \frac{h_w}{2} = \frac{h - 2t_f}{2} = \frac{500 - 2 \times 16}{2} = 234 \text{ mm}$$

The normal stress:

$$\sigma = \frac{M}{I_n} y_1 = \frac{-111{,}200{,}000 \text{ N·mm}}{468{,}110{,}000 \text{ mm}^4} \times 234 \text{ mm} = -55.6 \text{ N/mm}^2$$

According to clause 6.1.3 of *Standard for design of steel structures* and taking the top of web as the calculation point, calculate the area moment of the above rough section to the neutral axis at the shear stress:

$$S = 774{,}400 \text{ mm}^3$$

Shear stress:

$$\tau = \frac{VS}{It_w} = \frac{43{,}300 \text{ N} \times 774{,}400 \text{ mm}^3}{468{,}110{,}000 \text{ mm}^4 \times 10\text{mm}} = 7.163 \text{ N/mm}^2$$

According to clause 6.1.5 of *Standard for design of steel structures*, the local compressive stress $\sigma_c = 0$, so, $\beta_1 = 1.1$. The resultant stress is:

$$\sqrt{\sigma^2 + \sigma_c^2 - \sigma\sigma_c + 3\tau^2}$$

$$= \sqrt{(-55.6)^2 + 0^2 - 0 \times (-55.6) + 3 \times (7.16)^2} = 57.0 \text{ N/mm}^2$$

The allowable stress:

$$\beta_1 f = 1.1 \times 215 \text{ N/mm}^2 = 237 \text{ N/mm}^2$$

$$\sqrt{\sigma^2 + \sigma_c^2 - \sigma\sigma_c + 3\tau^2} < \beta_1 f$$

Ratio: $\frac{\sqrt{\sigma^2 + \sigma_c^2 - \sigma\sigma_c + 3\tau^2}}{\beta_1 f} = \frac{57.0}{237} = 0.24$

Shear Strength

The controlling load condition for shear is combination 10. F : 1.20DL+1.40LL+0.84WL:

$$V_y = 49.9 \text{ kN}$$

$$V_z = 540.3 \text{ kN}$$

Take the neutral axis as the calculation point of shear stress, calculate the area moment:

$$S_y = 1{,}048{,}000 \text{ mm}^3$$

According to clause 6.1.3 of *Standard for design of steel structures*, shear stress

$$\tau = \frac{VS}{It_w} = \frac{49{,}900 \text{ N} \times 1{,}048{,}000 \text{ mm}^3}{468{,}110{,}000 \text{ mm}^4 \times 10\text{mm}} = 11.18 \text{ N/mm}^2$$

$$\tau > f_v = 125 \text{ N/mm}^2$$

Therefore, the ratio is:

$$\frac{\tau}{f_v} = \frac{11.18}{125} = 0.09$$

Bending Strength

The controlling load condition for bending is combination 59. F : 1.35DL+0.84WF:

$$M_x = -111.2 \text{ kN·m}$$

$$M_y = 2.68 \text{ kN·m}$$

According to Clause 6.1.1 of *Standard for design of steel structures*,

$$\frac{M_x}{\gamma_x W_{nx}} + \frac{M_y}{\gamma_y W_{ny}} = \frac{111{,}200{,}000}{1.05 \times 1{,}872{,}400} + \frac{2{,}680{,}000}{1.20 \times 213{,}800} = 67.0 \text{ N/mm}^2$$

Ratio: $\dfrac{\dfrac{M_x}{\gamma_x W_{nx}} + \dfrac{M_y}{\gamma_y W_{ny}}}{f} = \dfrac{67.0}{215} = 0.31$

Comparison

Table 628: Comparison of results

V. GB500017-2017 H-section with Combined Axial and Bending

Verify the strength, stability, and slenderness of an H section subject to combined axial and bending per GB50017-2017.

Reference

MOHURD. 2017. *GB 50017-2017 Standard for design of steel structures* . Beijing, China: Ministry of Housing and Urban-Rural Development

Problem

The section is an HN400x408 with a length of 9 m. The structure is a two-story frame. Member #1 assigned with an H-section (HN400x408) is designed per GB 50017-2017. The section has an unbraced length of 4.5 m about the x direction and 9 m about the y direction.

Material Properties

The material is Q235 type steel.

Design strength in tension, compression, and flexure: $f_y = 205\ MPa$
Design strength in shear: $f_v = 120\ MPa$

Section Properties

Section depth, $h = 400\ mm$
Section width, $b = 408\ mm$
Flange thickness, $t_f = 21\ mm$
Web thickness, $t_w = 21\ mm$
Cross-sectional area, $A = 25{,}069\ mm^2$
Moment of inertia about x, $I_x = 708{,}880{,}000\ mm^4$
Moment of inertia about y, $I_y = 238{,}090{,}000\ mm^4$
Radius of gyration about x, $i_x = 168.2\ mm$
Radius of gyration about y, $i_y = 97.5\ mm$
Area moment about x, $S_x = 3{,}544{,}400\ mm^3$
Area moment about y, $S_x = 1{,}167{,}100\ mm^3$

Calculations

Slenderness Ratio

The effective length is:

$$l_{ox} = \mu_x \times l_x = 1.581 \times 4{,}500 \text{ mm} = 7{,}115 \text{ mm}$$

$$l_{oy} = \mu_y \times l_y = 1.319 \times 9{,}000 \text{ mm} = 11{,}870 \text{ mm}$$

The slenderness ratio is:

$$\lambda_x = \frac{l_{0x}}{i_x} = \frac{7{,}115}{168.2} = 42.3 < 150$$

$$\lambda_y = \frac{l_{0y}}{i_y} = \frac{11{,}870}{97.5} = 121.8 < 150$$

Ratio for tension slenderness: 42.3 / 150 = 0.28

Ratio for compression slenderness: 121.8 / 150 = 0.81

Steel Grade Correction Factor

The steel type is Q235. According to note 1 in table 3.5.1 of *Standard for design of steel structures* and table 1 of *Standard for design of steel structures. Commentary 2.2*, the steel grade correction coefficient is $\varepsilon_k = 1$.

Overall Stability Coefficient

According to the formula (C.0.1) in Appendix C of *Standard for design of steel structures*, the overall stability coefficient of the beam determined by the bending around the strong axis is calculated as:

$$\phi_{bx} = \beta_b \frac{4320}{\lambda_y^2} \times \frac{Ah}{W_y}\left[\sqrt{1 + \left(\frac{\lambda_y t_1}{4.4h}\right)^2} + \eta_b\right]\varepsilon_k$$

$$= 0.765 \times \frac{4{,}320}{(121.8)^2} \times \frac{250{,}691 \times 400}{354{,}4400}\left[\sqrt{1 + \left(\frac{121.8 \times 21}{4.4 \times 400}\right)^2} + 0\right] \times 1 = 1.113 > 0.6$$

According to the formula (c.0.1-7) in Appendix C of *Standard for design of steel structures*,

$$\phi_{bx}' = 1.07 - \frac{0.282}{1.113} = 0.817 < 1.0$$

So, for the section in x-x direction, $\phi_{bx} = 1.0$.

Stability Factor for Axial Compression

According to the formula (D.0.5) in Appendix D of *Standard for design of steel structures*,

For section y-y direction:

$$\lambda_n = \frac{\lambda_y}{\pi}\sqrt{\frac{f_y}{E}} = \frac{121.8}{\pi}\sqrt{\frac{225}{206{,}000}} = 1.281$$

Class c, so, the coefficients are $\alpha 1 = 0.730$, $\alpha 2 = 1.126$, and $\alpha 3 = 0.302$.

Since $\lambda_n = 1.281 > 0.215$, then the stability factor in y:

$$\phi_y = \frac{1}{2\lambda_n^2}\left[\left(\alpha_2 + \alpha_3\lambda_n + \lambda_n^2\right) - \sqrt{\left(\alpha_2 + \alpha_3\lambda_n + \lambda_n^2\right)^2 - 4\lambda_n^2}\right]$$

$$= \frac{1}{2 \times 1.281^2}\left[\left(1.216 + 0.302 \times 1.281 + 1.281^2\right) - \sqrt{\left(1.216 + 0.302 \times 1.281 + 1.281^2\right)^2 - 4 \times 1.281^2}\right] = 0.382$$

For section x-x direction:

$$\lambda_n = \frac{\lambda_y}{\pi}\sqrt{\frac{f_y}{E}} = \frac{42.3}{\pi}\sqrt{\frac{225}{206{,}000}} = 0.445$$

Class b, so, the coefficients are $\alpha 1 = 0.650$, $\alpha 2 = 0.965$, and $\alpha 3 = 0.300$.

Since $\lambda_n = 0.445 > 0.215$, then the stability factor in x:

$$\phi_x = \frac{1}{2\lambda_n^2}\left[\left(\alpha_2 + \alpha_3\lambda_n + \lambda_n^2\right) - \sqrt{\left(\alpha_2 + \alpha_3\lambda_n + \lambda_n^2\right)^2 - 4\lambda_n^2}\right]$$

$$= \frac{1}{2 \times 0.445^2}\left[\left(0.965 + 0.300 \times 0.445 + 0.445^2\right) - \sqrt{\left(0.965 + 0.300 \times 0.445 + 0.445^2\right)^2 - 4 \times 0.445^2}\right] = 0.893$$

Equivalent Moment Factor

The critical buckling load:

$$N_{cry} = \frac{\pi^2 E I_y}{\left(\mu_y l_y\right)^2} = \frac{\pi^2 \times 206{,}000 \times 238{,}090{,}000}{(1.319 \times 9{,}000)^2} = 3{,}435{,}000 \text{ N}$$

$$N_{crx} = \frac{\pi^2 EI_x}{(\mu_x l_x)^2} = \frac{\pi^2 \times 206000 \times 708{,}880{,}000}{(1.581 \times 4{,}500)^2} = 28{,}474{,}000 \text{ N}$$

For an unbraced frame:

$$\beta_{my} = 1 - \frac{0.36N}{N_{cry}} = 1 - 0.36 \times \frac{181.1}{3{,}435} = 0.981$$

$$\beta_{mx} = 1 - \frac{0.36N}{N_{crx}} = 1 - 0.36 \times \frac{181.1}{28{,}474} = 0.998$$

Because there is a reverse bending point, $M1$ and $M2$ have different signs:

$$\beta_{tx} = 0.65 + 0.35 M_2 / M_1 = 0.65 - 0.35 \times 12.66 / 174.5 = 0.625$$

$$\beta_{ty} = 0.65 + 0.35 M_{2y} / M_{1y} = 0.65 - 0.35 \times 7.39 / 57.06 = 0.605$$

Section influence coefficient, $\eta = 1.0$

Plastic Development Coefficient

According to clause 6.1.2 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3,

$$\gamma_x = 1.05$$

$$\gamma_y = 1.20$$

Check Web Thickness to Height Ratio

Calculated the web height:

$$h_0 = 400 - 21 - 21 = 358 \text{ mm}$$

$$\frac{h_0}{t_w} = \frac{458}{21} = 17.05$$

According to table 3.5.1 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3, so the limit value of height thickness ratio is:

$$40 + 18 \times \alpha_0^{1.5}$$

where

$$\sigma_{max} = \frac{N_x}{A} + \frac{M_x}{W_{z\text{-}web}} = \frac{176{,}800}{25{,}069} + \frac{16{,}000 \times (400 - 21 - 21)}{708{,}800{,}000 \times 2} = 7.056$$

where

$$a_{min} = \frac{N_x}{A} - \frac{M_x}{W_{z\text{-}web}} = \frac{176{,}800}{25{,}069} - \frac{16{,}000 \times (400 - 21 - 21)}{708{,}800{,}000 \times 2} = 7.048$$

where

$$a_0 = \frac{a_{max} - a_{min}}{a_{max}} = \frac{7.056 - 7.048}{7.056} = 0.001$$

Therefore, the limit value is: $40 + 18 \times 0.001^{1.5} = 40.00$

Ratio: $\frac{17.05}{40.00} = 0.43$

Check Flange Thickness to Width Ratio

$$b_0 = \frac{b - t_w}{2} = \frac{408 - 21}{2} = 194 \text{ mm}$$

$$\frac{b_0}{t_f} = \frac{193}{21} = 9.21$$

According to table 3.5.1 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3, so the limit value of width thickness ratio is:

$$13\varepsilon_k = 13$$

Ratio: $\frac{9.21}{13} = 0.71$

<u>Shear Strength</u>

The controlling load condition for shear is combination 10. F : 1.20DL+1.40LL+0.84WL:

$V_x = 46.5$ kN

$V_y = 9.52$ kN

Take the neutral axis as the calculation point of shear stress, calculate the area moment:

$S_x = 1{,}960{,}000 \text{ mm}^3$

$S_y = 893{,}700 \text{ mm}^3$

According to clause 6.1.3 of *Standard for design of steel structures*, shear stress

$$\tau_x = \frac{VS}{It_w} = \frac{46{,}500 \text{ N} \times 1{,}960{,}000 \text{ mm}^3}{708{,}880{,}000 \text{ mm}^4 \times 21\text{mm}} = 6.12 \text{ N/mm}^2$$

$$\tau_y = \frac{VS}{It_w} = \frac{9{,}526 \text{ N} \times 893{,}700 \text{ mm}^3}{238{,}090{,}000 \text{ mm}^4 \times 21\text{mm}} = 0.85 \text{ N/mm}^2$$

$\tau_{max} = 6.12 < f_v = 120 \text{ N/mm}^2$

Therefore, the ratio is:

$$\frac{\tau}{f_v} = \frac{6.12}{120} = 0.05$$

<u>Check In-plain Stability</u>

The controlling load condition for in-plane stability is combination 14. F : 1.2DL+1.4LL+0.84WF:

$M_x = 174.8$ kN·m

$M_y = 58.75$ kN·m

N = 181.2 kN

According to clause 8.2.5 of *Standard for design of steel structures*,

$$N_{Ex} = \frac{\pi^2 EA}{1.1\lambda_x^2} = \frac{\pi^2 206{,}000 \times 25{,}069}{1.1 \times 42.3^2} = 25{,}900 \text{ kN}$$

$$\frac{N}{\phi_x Af} + \frac{\beta_{mx} M_x}{\gamma_x W_x \left(1 - 0.8\frac{N}{N_{Ex}}\right) f} + \eta \frac{\beta_{ty} M_y}{\varphi_{by} W_y f} \qquad \text{(Cl. 8.2.5)}$$

$$= \frac{181.2}{0.893 \times 25{,}069 \times 205} + \frac{0.998 \times 174{,}8 \times 10^9}{1.05 \times 3{,}544{,}400 \times \left(1 - 0.8\frac{181.2}{25{,}900}\right) \times 205} + 1.0 \times \frac{0.605 \times 58.75 \times 10^6}{1.0 \times 1{,}167{,}110 \times 205} = 0.42 < 1.0$$

<u>Check Out-of-plain Stability</u>

The controlling load condition for in-plane stability is combination 14. F : 1.2DL+1.4LL+0.84WF:

$M_x = 174.8$ kN·m

$M_y = 58.75$ kN·m

N = 181.2 kN

According to clause 8.2.5 of *Standard for design of steel structures*,

$$N_{Ex} = \frac{\pi^2 EA}{1.1\lambda_x^2} = \frac{\pi^2 206{,}000 \times 25{,}069}{1.1 \times 121.8^2} = 3{,}123 \text{ kN}$$

$$\frac{N}{\phi_x A f} + \frac{\beta_{mx} M_x}{\gamma_x W_x \left(1 - 0.8\frac{N}{N_{Ex}}\right) f} + \eta \frac{\beta_{ty} M_y}{\varphi_{by} W_y f} \quad \text{(Cl. 8.2.5)}$$

$$= \frac{181.2 \times 1000}{0.382 \times 25{,}069 \times 205} + \frac{0.981 \times 58.75 \times 10^9}{1.2 \times 1{,}167{,}100 \times \left(1 - 0.8\frac{181.1}{3{,}123}\right) \times 205} + 1.0 \times \frac{0.625 \times 174.8 \times 10^9}{0.817 \times 3{,}544{,}400 \times 205} = 0.49 < 1.0$$

<u>Strength of the Member</u>

The controlling load condition for strength is combination 14. F : 1.2DL+1.4LL+0.84WF:

According to Clause 8.1.1 of *Standard for design of steel structures*,

$$\frac{N}{A_f f} + \frac{M_x}{r_x W_{nx} f} + \frac{M_y}{r_y W_{ny} f} = \frac{181.2}{25{,}069 \times 205} \frac{174.8 \times 10^6}{1.05 \times 3{,}544{,}400 \times 205} + \frac{58.75 \times 10^6}{1.20 \times 1{,}167{,}100 \times 205} = 0.47$$

Comparison

Table 629: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comment

V. GB500017-2017 Pipe section with Combined Axial and Bending

Verify the strength, stability, and slenderness of a pipe section subject to combined axial and bending per GB50017-2017.

Reference

MOHURD. 2017. *GB 50017-2017 Standard for design of steel structures* . Beijing, China: Ministry of Housing and Urban-Rural Development

Problem

The section is a PIP299x10.0 with a length of 4 m. The structure is a portal frame. Member #3 assigned with a pipe section (PIP299x10.0) is designed per GB 50017-2017. The section has an unbraced length of 4 m in either direction. The governing load case #1 has the following ultimate loads on the member:

$F_x = 24.45\ kN$
$F_y = 34.94\ kN$
$N = 93.30\ kN$
$M_x = -76.7\ kN \cdot m$ (at member end)
$M_y = 117.8\ kN \cdot m$ (at member end)

<u>Material Properties</u>

The material is Q235 type steel.

Design strength in tension, compression, and flexure: f_y = *215 MPa*
Design strength in shear: f_v = *125 MPa*

Section Properties

Outside diameter, D = *299 mm*
Wall thickness, t = *10 mm*
Cross-sectional area, A = *9,079* mm^2
Moment of inertia about x, I = *94,902,00* mm^4
Radius of gyration about x, = *102.2 mm*
Area moment about x, S = *417,600* mm^3

Calculations

Slenderness Ratio

The effective length is:

$$l_{ox} = \mu_x \times l_x = 1.297 \times 4{,}000 \text{ mm} = 5{,}188 \text{ mm}$$

$$l_{oy} = \mu_y \times l_y = 2.0383 \times 4{,}000 \text{ mm} = 8{,}150 \text{ mm}$$

The slenderness ratio is:

$$\lambda_x = \frac{l_{0x}}{i_x} = \frac{5{,}188}{102.2} = 50.73 < 150$$

$$\lambda_y = \frac{l_{0y}}{i_y} = \frac{8{,}150}{102.2} = 79.72 < 150$$

According to table 7.4.6 of *Standard for design of steel structures*, the allowable slenderness ratio of compression members is $\lambda_{clim} = 150$.
Ratio: $\lambda_{max} / \lambda_{clim} = 79.92 / 150 = 0.53$

According to table 7.4.7 of *Standard for design of steel structures*, the allowable slenderness ratio of tension members is $\lambda_{tlim} = 300$.
Ratio: $\lambda_{max} / \lambda_{tlim} = 79.92 / 300 = 0.27$

Steel Grade Correction Factor

The steel type is Q235. According to note 1 in table 3.5.1 of *Standard for design of steel structures* and table 1 of *Standard for design of steel structures. Commentary 2.2*, the steel grade correction coefficient is $\varepsilon_k = 1$.

Check Diameter to Thickness Ratio

$$\frac{D}{t} = \frac{299}{10} = 29.9$$

According to table 3.5.1 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3, so the limit value of height thickness ratio is:

$$93\varepsilon_k = 93$$

Ratio: $\frac{29.9}{90} = 0.33$

Plastic Development Coefficient

According to clause 8.1.1-2 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3,

$$\gamma_m = 1.15$$

Check Member Strength

According to clause 8.1.1-2 of *Standard for design of steel structures*,

$$\sigma = \frac{N}{A_n} + \frac{\sqrt{M_x^2 + M_y^2}}{\gamma_m W_n} = \frac{N}{\text{A}} + \frac{\sqrt{M_x^2 + M_y^2}}{\gamma_m W}$$

$$= \frac{93.3\times10^3}{9{,}079} + \frac{\sqrt{(76.7, \times, 10^6)^2 + (117.8, \times, 10^6)^2}}{1.15\times634{,}800} = 202.8 \text{ N/mm}^2$$

Ratio: $\frac{\sigma}{f} = \frac{202.8}{215} = 0.94$

Check Member Stability According to table 7.2.1-1 of *Standard for design of steel structures*, the section is “a” for this section.

According to the formula (D.0.5) in Appendix D of *Standard for design of steel structures*,

For section x-x direction:

$$\lambda_n = \frac{\lambda_y}{\pi}\sqrt{\frac{f_y}{E}} = \frac{50.73}{\pi}\sqrt{\frac{225}{206{,}000}} = 0.545$$

Class a, so, the coefficients are $\alpha 1 = 0.41$, $\alpha 2 = 0.986$, and $\alpha 3 = 0.152$.

Since $\lambda_n = 0.545 > 0.215$, then the stability factor in x:

$$\phi_x = \frac{1}{2\lambda_n^2}\left[\left(\alpha_2 + \alpha_3\lambda_n + \lambda_n^2\right) - \sqrt{\left(\alpha_2 + \alpha_3\lambda_n + \lambda_n^2\right)^2 - 4\lambda_n^2}\right]$$

$$= \frac{1}{2\times0.545^2}\left[\left(0.986 + 0.152\times0.545 + 0.545^2\right) - \sqrt{\left(0.986 + 0.152\times0.445 + 0.545^2\right)^2 - 4\times0.545^2}\right] = 0.914$$

For section y-y direction:

$$\lambda_n = \frac{\lambda_y}{\pi}\sqrt{\frac{f_y}{E}} = \frac{79.72}{\pi}\sqrt{\frac{225}{206{,}000}} = 0.857$$

Class a, so, the coefficients are $\alpha 1 = 0.41$, $\alpha 2 = 0.986$, and $\alpha 3 = 0.152$.

Since $\lambda_n = 0.875 > 0.215$, then the stability factor in x:

$$\phi_x = \frac{1}{2\lambda_n^2}\left[\left(\alpha_2 + \alpha_3\lambda_n + \lambda_n^2\right) - \sqrt{\left(\alpha_2 + \alpha_3\lambda_n + \lambda_n^2\right)^2 - 4\lambda_n^2}\right]$$

$$= \frac{1}{2\times0.857^2}\left[\left(0.986 + 0.152\times0.857 + 0.857^2\right) - \sqrt{\left(0.986 + 0.152\times0.857 + 0.857^2\right)^2 - 4\times0.857^2}\right] = 0.785$$

So, $\phi_{min} = 0.785$

Equivalent Moment Factor

According to formula 8.2.4-6 of *Standard for design of steel structures*:

$$N_E = \frac{\pi^2 EA}{\lambda^2} = \frac{\pi^2\times206{,}000\times9{,}079}{79.72^2} = 2{,}904{,}600 \text{ N}$$

According to the note of formula 8.2.4 of *Standard for design of steel structures*:

M_{1x} = -76.7 kN·m

M_{2x} = 63.06 kN·m

M_{1y} = 117.8 kN·m

M_{2y} = -0.006 kN·m

According to formula 8.2.4-4 of *Standards for design of steel structures*:

$$\beta_x = 1 - 0.35\sqrt{\frac{N}{N_E}} + \sqrt{\frac{N}{N_E}}\frac{W_{2x}}{W_{1x}} = 1 - 0.35 \times \sqrt{\frac{93.3}{2{,}905}} + 0.35 \times \sqrt{\frac{93.3}{2{,}905}}\frac{63.06}{-76.7} = 0.886$$

According to formula 8.2.4-5 of *Standards for design of steel structures*:

$$\beta_y = 1 - 0.35\sqrt{\frac{N}{N_E}} + \sqrt{\frac{N}{N_E}}\frac{W_{2y}}{W_{1y}} = 1 - 0.35 \times \sqrt{\frac{93.3}{2{,}905}} + 0.35 \times \sqrt{\frac{-0.006}{117.8}}\frac{63.06}{-76.7} = 0.937$$

According to formula 8.2.4-5 of *Standards for design of steel structures*:

$\beta = \beta_x\beta_y = 0.886 \times 0.937 = 0.830$

According to formula 8.2.1-2 of *Standard for design of steel structures*:

$$N'_{Ex} = \frac{\pi^2 EA}{1.1\lambda_{max}^2} = \frac{\pi^2 \times 206{,}000 \times 9{,}079}{1.1 \times 79.72^2} = 2{,}640{,}500 \text{ N}$$

According to the note of formula 8.2.4-2 of *Standard for design of steel structures*:

M_{xA} = 63.06 kN·m

M_{yA} = -0.006 kN·m

M_{xB} = -76.7 kN·m

M_{yB} = 117.8 kN·m

$$\sqrt{M_{xA}^2 + M_{yA}^2} = \sqrt{(63.06)^2 + (-0.006)^2} = 63.06 \text{ kN·m}$$

$$\sqrt{M_{xB}^2 + M_{yB}^2} = \sqrt{(-76.7)^2 + (117.8)^2} = 140.6 \text{ kN·m}$$

M_{max} = 140.6 kN·m

According to the note of formula 8.2.4-2 of *Standard for design of steel structures*:

$$\frac{N}{\phi A f} + \frac{\beta M}{\gamma_m W\left(1 - 0.8\frac{N}{N'_{Ex}}\right)f}$$

$$= \frac{93.3 \times 10^3}{0.875 \times 9{,}079 \times 215} + \frac{0.830 \times 140.6 \times 10^6}{1.15 \times 634{,}792\left(1, \ - , \ \frac{93.3}{2{,}641}\right)215} = 0.826$$

<u>Shear Strength</u>

Take the neutral axis as the calculation point of shear stress, calculate the area moment:

$S = 417{,}605 \text{ mm}^3$

According to clause 6.1.3 of *Standard for design of steel structures*, shear stress

$$\tau_x = \frac{VS}{It_w} = \frac{29{,}449 \times 417{,}605}{94{,}902{,}000 \times 20} = 6.48 \text{ N/mm}^2$$

$$\tau_x = \frac{VS}{It_w} = \frac{34{,}940 \times 417{,}605}{94{,}902{,}000 \times 20} = 7.69 \text{ N/mm}^2$$

$$\tau_{max} = 7.69 < f_v = 125 \text{ N/mm}^2$$

Therefore, the ratio is:

$$\frac{\tau}{f_v} = \frac{7.89}{125} = 0.06$$

Comparison

V. GB500017-2017 Single Angle section with Axial Force

Verify the slenderness, strength, and stability of a single-angle section subject to axial force per GB50017-2017.

Reference

MOHURD. 2017. *GB 50017-2017 Standard for design of steel structures* . Beijing, China: Ministry of Housing and Urban-Rural Development

Problem

The section is an L100x100x6 with a length of 3.005 m. The structure is a truss model. Member #34 assigned with single angle section (L100x100x6) is designed per GB 50017-2017. The governing load combination (#4) is 1.2 DL + 1.4 LL and the ultimate force on the member, N, is 92.06 kN of axial compression.

The material is Q235 type steel.

Design strength in tension, compression, and flexure: $f_y = 215\ MPa$
Design strength in shear: $f_v = 125\ MPa$

Calculations

<u>Section Properties</u>

Side length, $b = h = 100\ mm$
Thickness, $t = 6\ mm$
Cross-sectional area, $A = 1{,}193\ mm^2$
Moment of inertia about x, $I_x = 479{,}000\ mm^4$
Moment of inertia about y, $I_y = 1{,}820{,}000\ mm^4$
Radius of gyration about x, $i_x = 20.04\ mm$
Radius of gyration about y, $i_y = 39.06\ mm$
Area moment about x, $S_x = 15{,}890\ mm^3$
Area moment about y, $S_x = 31{,}690\ mm^3$

<u>Slenderness Ratio</u>

According to Table 7.4.1-1 of GB50017-2017, effective length of double angle is:

$$l_{ox} = \mu_x \times l_x = 0.8 \times 3{,}005 \text{ mm} = 2{,}404 \text{ mm}$$

$$l_{oy} = \mu_y \times l_y = 1.0 \times 3{,}005 \text{ mm} = 3{,}005 \text{ mm}$$

According to formula 7.2.1-1 and 2 of steel structures code, slenderness ratio of double angle with X axis and Y axis is:

$$\lambda_x = \frac{l_{0x}}{i_x} = \frac{2{,}404}{20.04} = 119.8$$

$$\lambda_y = \frac{l_{0y}}{i_y} = \frac{3{,}005}{39.06} = 76.94$$

According to formula 7.2.2-3 and 7.2.2.-4 of steel structures code, torsional buckling equivalent slenderness ratio of single angle is calculated as follows.

The relative coordinates from the centroid to the heel (corner) of the angle are:

$$x_c = 27.23 \text{ mm}$$

$$y_c = 27.23 \text{ mm}$$

The distance from the centroid to the shear center, y_s:

$$y_z^2 = 2 \times \left(x_c - \frac{t}{2}\right)^2 = 2 \times \left(27.23 - \frac{6}{2}\right)^2 = 1{,}174 \text{ mm}^2$$

The polar radius of gyration of the shear center, i_0:

$$i_0^2 = i_0^2 + i_x^2 + i_y^2 = 1{,}174 + 20.04^2 + 39.06^2 = 3{,}101 \text{ mm}^2$$

Polar moment of inertia of gross angle to the shear center, I_0:

$$I_0 = i_0^2 A = 3{,}101 \times 1{,}193 = 3{,}700{,}000 \text{ mm}^4$$

The free torsion constant of shear center on gross angle section. The correction factor for the free torsion factor, $k = 1.2$.

$$I_t = (I_{t1} + I_{t2})k = \left(\frac{bt^3}{3} + \frac{(b - t)t^3}{3}\right)k = \frac{k(2b - t)t^3}{3} = \frac{1.2 \times (2 \times 100 - 6) \times (6)^3}{3} = 16{,}760 \text{ mm}^4$$

Fan moment of inertia of the gross angle section to shear center, I_ω:

$$I_t = \frac{t^3 b^3}{18} = \frac{(6)^3(100)^3}{18} = 12{,}000{,}000 \text{ mm}^6$$

Length for torsional buckling, $l_\omega = 2{,}404\ mm$. The torsional buckling equivalent slenderness ratio, λ_z^2:

$$\lambda_z^2 = \frac{I_0}{I_t / 25.7 + I_\omega / l_\omega^2} = \frac{3{,}700{,}000}{16{,}762 / 25.7 + 12{,}000{,}000 / 2{,}404^2} = 5{,}655$$

Calculate the slenderness ratio for flexural torsional buckling, λ_{yz}:

$$\lambda_{yz} = \sqrt{\frac{\left(\lambda_y^2 + \lambda_z^2\right) + \sqrt{\left(\lambda_y^2 + \lambda_z^2\right)^2 - 4\left(1 - \frac{y_s^2}{i_0^2}\right)\lambda_y^2 \lambda_z^2}}{2}}$$

$$= \sqrt{\frac{\left(120.0^2 + 5{,}655\right) + \sqrt{\left(120.0^2 + 5{,}655\right)^2 - 4 \times \left(1 - \frac{1{,}174}{3{,}101}\right) \times 120.0^2 \times 5{,}655}}{2}} = 130.7$$

The maximum slenderness ratio of the single angle section, $\lambda_{max} = 130.7$

The limit of slenderness ratio of compression member is 150 according to table 7.4.6 of steel structures code.

$$\lambda_{\text{max}} / \lambda_{\text{limit}} = \frac{130.7}{150} = 0.87 < 1.0, \text{ Passed}$$

The limit of slenderness ratio of tension member is 300 according to table 7.4.7 of steel structures code.

$$\lambda_{\text{max}} / \lambda_{\text{limit}} = \frac{130.7}{300} = 0.44 < 1.0, \text{ Passed}$$

<u>Tension or Compression Strength</u>

According to Table 7.1.3 of GB50017-2017, the $\eta = 0.85$.

According to formula 7.1.1-1 of steel structures code, the stress of single angle with gross cross-section area is:

$$\sigma = \frac{N}{\eta A} = \frac{92{,}060}{0.85 \times 2{,}760} = 90.79$$

According to clause 7.6.1-1 of steel structures code, reduction factor of strength design value of angle is 0.85.

$$0.85 f = 0.85 \text{ x } 215 = 182.8 \text{ N/mm}^2$$

And the ratio is:

$$\frac{\sigma}{0.85 f} = \frac{90.79}{187.8} = 0.50$$

According to formula 7.1.1-2 of the steel structures code, the strength ratio is:

$$0.85 f_u = 0.85 \times 370 = 314.5 \text{ N/mm}^2$$

And the ratio is:

$$\frac{\sigma}{0.7\text{f}_u} = \frac{90.79}{0.7 \times 314.5} = 0.41$$

Steel Grade Correction Factor

The steel type is Q235. According to note 1 in table 3.5.1 of *Standard for design of steel structures* and table 1 of *Standard for design of steel structures. Commentary 2.2*, the steel grade correction coefficient is $\varepsilon_k = 1$.

Compressive Strength

According to table 7.2.1-1 of steel structures code, the double angle section class is b.

The slenderness ratio of double angle on X axis, $\lambda_x = 76.93$. So,

$$\frac{\lambda}{\varepsilon_k} = \lambda_y = 76.93$$

$$\lambda_n = \frac{\lambda_x}{\pi}\sqrt{\frac{f_y}{E}} = \frac{76.93}{\pi}\sqrt{\frac{235}{206{,}000}} = 0.827$$

Class b, so, the coefficients are $a1 = 0.650$, $a2 = 0.965$, and $a3 = 0.300$.

Since $\lambda_n = 0.827 > 0.215$, then the stability factor in x:

$$\phi_x = \frac{1}{2\lambda_n^2}\left[\left(a_2 + a_3\lambda_n + \lambda_n^2\right) - \sqrt{\left(a_2 + a_3\lambda_n + \lambda_n^2\right)^2 - 4\lambda_n^2}\right]$$

$$= \frac{1}{2 \times 0.827^2}\left[\left(0.965 + 0.300 \times 0.827 + 0.827^2\right) - \sqrt{\left(0.965 + 0.300 \times 0.827 + 0.827^2\right)^2 - 4 \times 0.827^2}\right] = 0.708$$

The slenderness ratio of double angle on symmetry axis is $\lambda_{yz} = 130.7$. So,

$$\frac{\lambda}{\varepsilon_k} = \lambda_x = 130.7$$

$$\lambda_n = \frac{\lambda_{\text{xy}}}{\pi}\sqrt{\frac{f_y}{E}} = \frac{130.7}{\pi}\sqrt{\frac{235}{206{,}000}} = 1.405$$

Class b, so, the coefficients are $a1 = 0.650$, $a2 = 0.965$, and $a3 = 0.300$.

Since $\lambda_n = 1.405 > 0.215$, then the stability factor in xy:

$$\phi_{yz} = \frac{1}{2\lambda_n^2}\left[\left(a_2 + a_3\lambda_n + \lambda_n^2\right) - \sqrt{\left(a_2 + a_3\lambda_n + \lambda_n^2\right)^2 - 4\lambda_n^2}\right]$$

$$= \frac{1}{2 \times 1.405^2}\left[\left(0.965 + 0.300 \times 1.405 + 1.405^2\right) - \sqrt{\left(0.965 + 0.300 \times 1.405 + 1.405^2\right)^2 - 4 \times 1.405^2}\right] = 0.384$$

The minimum stability factor is 0.384.

Compression Flange Width to Thickness Ratio

From GB50017-2017 Clause 7.3.1-5, when $\lambda = 80\varepsilon_k$, the formula 7.3.1-7 should be used to obtain the value of the width to thickness of a compression member. Here, $\lambda_{yz} = 130.7$ and $\varepsilon_k = 1$.

So, the limiting value of the width to thickness ratio = $5\varepsilon_k + 0.125\lambda = 5 + 0.125 \times 130.7 = 21.34$.

According to Clause 7.3.2 of GB50017-2017,

$$\phi A \times f = 0.384 \times 1{,}193 \times 215 = 98{,}494$$

$N = 92{,}061 < \phi A \times f$, so the magnification factor $a = \sqrt{\frac{98{,}494}{92{,}061}} = 1.034$

Therefore, Limit value of width to thickness ratio should be $1.034 \times 21.34 = 22.07$.

The width per formula 7.3.1-7 of GB50017-2017, $w = b - 2t = 100 - 2 \times 6 = 88\ mm$.

The actual width to thickness ratio is $\frac{88}{6} = 14.67 < 22.07$

So the ratio is $\frac{14.67}{22.07} = 0.66$.

Since the section is a equal leg angle, the check for the height to thickness ratio is the same; therefore ok.

Stability of Compression Member

According to formula 7.6.1-2 of GB50017-2017,

$$\eta = 0.6 + 0.0015\lambda = 0.6 + 0.0015 \times 130.7 = 0.796$$

The reduction factor of stability bearing capacity, ρ_e must be calculated as $\frac{w}{t} = 14.67 > 14\varepsilon_k = 14$.

$$\rho_e = 1.3 - \frac{0.3w}{14t\varepsilon_k} = 1.3 - \frac{0.3 \times 88}{14 \times 6 \times 1} = 0.986$$

The member capacity according to formula 7.6.1-1 of GB50017-2017:

$$\rho_e \eta \phi A f = 0.986 \times 0.796 \times 0.384 \times 1{,}193 \times 215 \times 10^{-3} = 77.30\ kN$$

So the ratio is $\frac{92.06}{77.30} = 1.19 > 1.0$; Failed.

Comparison

V. GB500017-2017 Tube section with Combined Axial and Bending

Verify the strength, stability, and slenderness of a tube section subject to combined axial and bending per GB50017-2017.

Reference

MOHURD. 2017. *GB 50017-2017 Standard for design of steel structures* . Beijing, China: Ministry of Housing and Urban-Rural Development

Problem

The section is a TUB 300x10.0 with a length of 4 m. The structure is a portal frame. Member #1 assigned with a tube section (TUB300x10.0) is designed per GB 50017-2017. The section has an unbraced length of 4 m in either direction. The governing load case #1 has the following ultimate loads on the member:

$F_x = 30.55\ kN$
$F_y = 25.06\ kN$
$N = 66.69\ kN$
$M_x = 83.44\ kN{\cdot}m$ (at member end)
$M_y = 122.2\ kN{\cdot}m$ (at member end)

The material is Q235 type steel.

Design strength in tension, compression, and flexure: $f_y = 215\ MPa$

Design strength in shear: $f_v = 125\ MPa$

Calculations

Section Properties

Section depth, $H = 300\ mm$
Section width, $D = 300\ mm$
Wall thickness, $t = 10\ mm$
Cross-sectional area, $A = 11{,}260\ mm^2$
Moment of inertia about x, $I_x = I_y = 155{,}200{,}00\ mm^4$
Radius of gyration about x, $r_x = r_y = 118.2\ mm$
Section modulus about x, $W_x = W_y = 1{,}035{,}000\ mm^3$

Slenderness Ratio

The effective length is:

$$l_{ox} = \mu_x \times l_x = 1.402 \times 4{,}000 \text{ mm} = 5{,}188 \text{ mm}$$

$$l_{oy} = \mu_y \times l_y = 2.0383 \times 4{,}000 \text{ mm} = 8{,}150 \text{ mm}$$

The slenderness ratio is:

$$\lambda_x = \frac{l_{0x}}{i_x} = \frac{\mu_x l}{i_x} = \frac{1.402 \times 4{,}000}{117.4} = 47.77 < 150$$

$$\lambda_y = \frac{l_{0y}}{i_y} = \frac{\mu_y l}{i_y} = \frac{2.038 \times 4{,}000}{117.4} = 69.44 < 150$$

According to table 7.4.6 of *Standard for design of steel structures*, the allowable slenderness ratio of compression members is $\lambda_{clim} = 150$.

Ratio: $\lambda_{max} / \lambda_{clim} = 69.44 / 150 = 0.46$

According to table 7.4.7 of *Standard for design of steel structures*, the allowable slenderness ratio of tension members is $\lambda_{tlim} = 300$.

Ratio: $\lambda_{max} / \lambda_{tlim} = 69.44 / 300 = 0.23$

Steel Grade Correction Factor

The steel type is Q235. According to note 1 in table 3.5.1 of *Standard for design of steel structures* and table 1 of *Standard for design of steel structures. Commentary 2.2*, the steel grade correction coefficient is $\varepsilon_k = 1$.

Check Flange Width to Thickness Ratio of Compression Member

$$\frac{B - 2t}{t} = \frac{300 - 2 \times 10}{10} = 28$$

According to table 3.5.1, note 2 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3, so the limit value of height thickness ratio is:

$$40\varepsilon_k = 40$$

Ratio: $\frac{28}{40} = 0.70$

Note: Since the section is a square tube, the web heigh to flange thickness check is the same.

Plastic Development Coefficient

According to clause 8.1.1 of *Standard for design of steel structures*, and the width thickness ratio of cross-section plate is grade S3,

$$\gamma_x = 1.05$$

$$\gamma_y = 1.05$$

Check Member Strength

According to clause 8.1.1 of *Standard for design of steel structures*,

$$\sigma = \frac{N}{A_n} + \frac{M_x}{\gamma_x W_{nx}} + \frac{M_y}{\gamma_y W_{ny}} = \frac{N}{A} + \frac{M_x}{\gamma_x W_x} + \frac{M_y}{\gamma_y W_y}$$

$$= \frac{66.69\times10^3}{11{,}260} + \frac{83.44\times10^6}{1.05\times1{,}034{,}600} + \frac{122.2\times10^6}{1.05\times1{,}034{,}600} = 195.2 \text{ N/mm}^2$$

Ratio: $\frac{\sigma}{f} = \frac{195.2}{215} = 0.91$

Check In-Plane Stability of Member According to table 7.2.1-1 of *Standard for design of steel structures*, the section is “b” for this section.

According to the formula (D.0.5) in Appendix D of *Standard for design of steel structures*, for the x-x direction:

$$\lambda_n = \frac{\lambda_x}{\pi}\sqrt{\frac{f_y}{E}} = \frac{47.77}{\pi}\sqrt{\frac{235}{206{,}000}} = 0.514$$

Class b, so, the coefficients are $\alpha 1 = 0.650$, $\alpha 2 = 0.965$, and $\alpha 3 = 0.300$.

Since $\lambda_n = 0.514 > 0.215$, then the stability factor in x:

$$\phi_x = \frac{1}{2\lambda_n^2}\left[\left(\alpha_2 + \alpha_3\lambda_n + \lambda_n^2\right) - \sqrt{\left(\alpha_2 + \alpha_3\lambda_n + \lambda_n^2\right)^2 - 4\lambda_n^2}\right]$$

$$= \frac{1}{2 \times 0.514^2}\left[\left(0.965 + 0.300 \times 0.514 + 0.514^2\right) - \sqrt{\left(0.965 + 0.300 \times 0.514 + 0.514^2\right)^2 - 4 \times 0.514^2}\right] = 0.866$$

According to the formula 8.2.1-8 of *Standard for design of steel structures*,

$$N_{cr} = \frac{\pi^2 EI}{(\mu l)^2} = \frac{\pi^2 EI_x}{(\mu_x l)^2}$$

$$= \frac{\pi^2 \times 206{,}000 \times 155{,}190{,}000}{(1.402 \times 4{,}000)} = 10{,}033 \text{ kN}$$

According to the formula 8.2.1-10 of *Standard for design of steel structures*,

$$\beta_{mx} = 1 - 0.36N / N_{cr} = 1 - 0.36 \times 66.69 / (10{,}033) = 0.998$$

According to the formula 8.2.1-12 and 8.2.1-5 note of *Standard for design of steel structures*,

$$\beta_{ty} = 0.65 + 0.35 \times \frac{M_2}{M_1} = 0.65 + 0.35 \times \frac{6{,}000}{122{,}200{,}000} = 0.65$$

According to the formula 8.2.1-12 of *Standard for design of steel structures*,

$$N'_{Ex} = \frac{\pi^2 EA}{1.1\lambda_x^2} = \frac{\pi^2 \times 206{,}000 \times 11{,}260}{1.1 \times (47.77)^2} = 9{,}121 \text{ kN}$$

According to the formula 8.2.5, $\phi_{by} = 1.0$.

According to the formula 8.2.1, $\eta = 0.7$.

According to the formula 8.2.5-1,

$$\frac{N}{\phi_x Af} + \frac{\beta_{mx} M_x}{\gamma_x W_x \left(1 - 0.8\frac{N}{N'_{Ex}}\right) f} + \eta \frac{\beta_{ty} M_y}{\phi_{by} W_y f}$$

$$\frac{66.69 \times 10^3}{0.866 \times 11{,}260215} + \frac{0.998 \times 83.44 \times 10^6}{1.05 \times 1{,}034{,}600\left(1 - 0.8 \times \frac{66.69}{9{,}121}\right)215} + 0.7\frac{0.65 \times 122.2 \times 10^6}{1.0 \times 1{,}034{,}600 \times 215} = 0.64$$

Check Out-of-Plane Stability of Member According to table 7.2.1-1 of *Standard for design of steel structures*, the section is "b" for this section.

According to the formula (D.0.5) in Appendix D of *Standard for design of steel structures*, for the y-y direction:

$$\lambda_n = \frac{\lambda_y}{\pi}\sqrt{\frac{f_y}{E}} = \frac{69.44}{\pi}\sqrt{\frac{235}{206{,}000}} = 0.747$$

Class b, so, the coefficients are $\alpha 1 = 0.650$, $\alpha 2 = 0.965$, and $\alpha 3 = 0.300$.

Since $\lambda_n = 0.747 > 0.215$, then the stability factor in x:

$$\phi_x = \frac{1}{2\lambda_n^2}\left[\left(\alpha_2 + \alpha_3\lambda_n + \lambda_n^2\right) - \sqrt{\left(\alpha_2 + \alpha_3\lambda_n + \lambda_n^2\right)^2 - 4\lambda_n^2}\right]$$

$$= \frac{1}{2 \times 0.747^2}\left[\left(0.965 + 0.300 \times 0.747 + 0.747^2\right) - \sqrt{\left(0.965 + 0.300 \times 0.747 + 0.747^2\right)^2 - 4 \times 0.747^2}\right] = 0.754$$

According to the formula 8.2.1-8 of *Standard for design of steel structures*,

$$N_{cr} = \frac{\pi^2 EI}{(\mu l)^2} = \frac{\pi^2 EI_y}{(\mu_y l)^2}$$

$$= \frac{\pi^2 \times 206{,}000 \times 155{,}190{,}000}{(2.038 \times 4{,}000)} = 4{,}748 \text{ kN}$$

According to the formula 8.2.1-10 of *Standard for design of steel structures*,

$$\beta_{my} = 1 - 0.36N / N_{cr} = 1 - 0.36 \times 66.69 / (4{,}748) = 0.995$$

According to the formula 8.2.1-12 and 8.2.1-5 note of *Standard for design of steel structures*,

$$\beta_{tx} = 1.0$$

According to the formula 8.2.1-12 of *Standard for design of steel structures*,

$$N'_{Ey} = \frac{\pi^2 EA}{1.1\lambda_y^2} = \frac{\pi^2 \times 206{,}000 \times 11{,}260}{1.1 \times (69.44)^2} = 4{,}316 \text{ kN}$$

According to the formula 8.2.5, $\phi_{bx} = 1.0$.

According to the formula 8.2.1, $\eta = 0.7$.

According to the formula 8.2.5-2,

$$\frac{N}{\phi_x A f} + \eta \frac{\beta_{tx} M_x}{\phi_{\mathrm{bx}} W_x f} + \frac{\beta_{my} M_y}{\gamma_y W_y \left(1 - 0.8 \frac{N}{N'_{Ey}}\right) f}$$

$$\frac{66.69 \times 10^3}{0.754 \times 11{,}260215} + 0.7 \frac{1.0 \times 83.44 \times 10^6}{1.0 \times 1{,}034{,}600 \times 215} + \frac{0.995 \times 122.2 \times 10^6}{1.05 \times 1{,}034{,}600 \left(1 - 0.8 \times \frac{66.69}{4{,}316}\right) 215} = 0.83$$

<u>Shear Strength</u>

Take the neutral axis as the calculation point of shear stress, calculate the area moment:

$$\mathrm{S} = 417{,}605 \text{ mm}^3$$

According to clause 6.1.3 of *Standard for design of steel structures*, shear stress

$$\tau_x = \frac{VS}{I t_w} = \frac{V S_x}{I_y (2t)} = \frac{30.55 \times 10^3 \times 631{,}000}{155{,}190{,}000 \times 2 \times 10} = 6.21 \text{ N/mm}^2$$

$$\tau_y = \frac{VS}{I t_w} = \frac{V S_x}{I_x (2t)} = \frac{25.06 \times 10^3 \times 631{,}000}{155{,}190{,}000 \times 2 \times 10} = 5.09 \text{ N/mm}^2$$

$$\tau_{max} = 7.69 < f_v = 125 \text{ N/mm}^2$$

Therefore, the ratio is:

$$\frac{\tau_{max}}{f_v} = \frac{6.21}{125} = 0.05$$

Comparison

V. Europe

V. EC3 - Pinned column using non-slender UKC section

Verify the design of a pinned column per the EC3 2005 design code.

Details

The column is 8 m with pinned ends. The member is a 305 x 305 x 97 UKC shape with S275 grade steel. The axial load is 2,000 kN and $L_{cry}/L = 0.7$.

Partial safety factors:

$$\Gamma_{M0} = 1.0$$

$$\Gamma_{M1} = 1.0$$

Validation

<u>Effective Length Calculations</u>

$$L_{cry} = 0.7 \times 8{,}000 = 5{,}600 \text{ mm}$$

$L_{crz} = 1.0 \times 8{,}000 = 8{,}000$ mm

Yield Strength

Steel grade S275

The maximum thickness = *15.4 mm < 40 mm*; therefore *fy = 275 N/mm² [EN 1993-1-1:2005 Table 3.1]*

Section Classification

$\varepsilon = \sqrt{(235/fy)} = 0.92$ [EN 1993-1-1:2005 Table 5.2]

Outstanding flange (flange under uniform compression):

$c = (b-t_w-2r)/2 = (305.3 - 9.9 - 2 \times 15.2)/2 = 132.3$ mm

'

$c/t_f = 132.3/15.4 = 8.6 < 10\ \varepsilon$

Class 2 element *[EN 1993-1-1:2005 Table 5.2 Sheet 2]*

Internal compression part (web in bending):

$c = h-2t_f-2r = 307.9-2 \times 15.4 - 2 \times 15.2 = 246.7$ mm

$c/t_w = 246.7/9.9 = 24.92 < 33\ \varepsilon$

Class 1 element *[EN 1993-1-1:2005 Table 5.2 Sheet 1]*

Therefore, section is a Class 2 section.

Axial Resistance

Design axial resistance:

$N_{c,Rd} = A \times fy/\Gamma_{m0} = 123.4\ cm^2(10^2) \times 275\ kN/mm^2 / 1.0 \times 10^{-3} = 2{,}283\ kN > 2{,}000\ kN$ [EN 1993-1-1:2005 Cl. 6.2.4]

Lateral Buckling

Determine the elastic critical moment, M_{cr}:

$$N_{bRd} = \frac{\chi A fy}{\Gamma_{M1}}$$ [EN 1993-1-1:2005 Cl. 6.3.1.1]

$N_{cr} = (\pi^2 \times E \times Iy)/Ly^2 = [\pi^2 \times 205{,}000 \times 7{,}308(10^4)] / (56{,}002 \times 1{,}000) = 4715$ kN

$\lambda = (A \times fy/Ncr)^{0.5} = (123 \times 10^2 \times 275 / 4{,}715 \times 10^3)^{0.5} = 0.847$

$h/b = 307.9/305.3 = 1 < 1.2\ \&\ t_f < 100$ mm

$\alpha = 0.49$ [EN 1993-1-1:2005 Table 6.3]

$\phi = 0.5\,[1 + \alpha(\lambda - 0.2) + \lambda^2]$ [EN 1993-1-1:2005 Cl. 6.3.2.3]

$\phi = 0.5\,[1 + 0.49(0.847 - 0.2) + 0.847^2] = 1.017$

$$\chi = \frac{1}{\varnothing + \sqrt{(\varnothing^2 - \lambda^2)}} = \frac{1}{1.017 + \sqrt{(1.017^2 - 0.847^2)}} = 0.639 < 1.0$$

$$N_{bRd} = \frac{0.639 \times 123 \times 10^2 275 \times 10^{-3}}{1.0} = 2{,}161\ kN$$

Critical Ratio

$P / N_{bRd} = 2{,}000 / 2{,}161 = 0.925$

Results

V. EC3 - Pipe Section with Conc Load

Verify the adequacy of a circular hollow section used as a beam subject to concentrated loads per EN 1993-1-1:2005 (no national annex used).

Details

The member is a 6 m long beam with pinned ends. The beam supports 10kN concentrated loads at the third points. The steel is grade S275. The section is a European 114.3X8CHS.

Section Properties

A = 26.7 cm^2
Outer diameter = 114.3 mm
t = 8 mm
$I_z = I_y = 379\ cm^4$
$Z_z = Z_y = 90.6\ cm^3$
$C_w = 0\ cm^6$

$$r_z = r_y = \sqrt{I/A} = \sqrt{\frac{379}{26.7}} = 3.768\ \ cm$$

Partial safety factors:

$$\Gamma_{M0} = 1.0$$

$$\Gamma_{M1} = 1.0$$

$$\Gamma_{M2} = 1.25$$

Validation

Section Classification

$$\varepsilon = \sqrt{\frac{235}{f_y}} = \sqrt{\frac{235}{275}} = 0.924$$

As per Table 5.2:

$$d / t = 114.3 / 8 = 14.3 < 50\times\varepsilon^2 = 50\ (0.924)^2 = 42.7$$

Hence, this is a Class 1 section.

Slenderness Ratio

The slenderness ratio = $kL\ /\ r = 1 \times 6{,}000\ /\ 37.68 = 159.3$

Axial Tension

Determine axial tension capacity per Cl. 6.2.3.

$$N_{\mathrm{pl,Rd}} = A_g \times f_y / \gamma_{\mathrm{M0}} = 2{,}670 \times 275 / 1.0 \times (10)^{-3} = 734.3\ \mathrm{kN}$$

$$N_{u,Rd} = 0.9A_{net} \times f_u / \gamma_{M2} = 0.9 \times 2{,}670 \times 295 / 1.25 \times (10)^{-3} = 567.1 \text{ kN}$$

The tensile capacity is the minimum of $N_{pl,Rd}$ and $N_{u,Rd}$, thus: $N_{t,Rd} = 567.1\ kN$.

No axial tension in section, so by observation no need to check ratio.

<u>Axial Compression</u>

Determine axial compression capacity per Cl. 6.2.4 for a Class 1 section.

$$N_{c,Rd} = A_g \times f_y / \gamma_{M0} = 2{,}670 \times 275 / 1.0 \times (10)^{-3} = 734.3 \text{ kN}$$

Next, check the flexural buckling resistance per Cl. 6.3.1.3:

$$N_{b,Rd} = \chi \times A \times f_y / \gamma_{M1}$$

From Table 6.1: the imperfection factor, $a = 0.21$.

$$\bar{\lambda} = \sqrt{A \times f_y / N_{cr}} = L_{cr} / i \times \lambda_1$$

where

L_{cr}	=	6,000 mm
i	=	37.68 mm
λ_1	=	$93.9 \times \varepsilon = 93.9 \times 0.924 = 86.8$

$$\bar{\lambda} = 1.834$$

$$\Phi = 0.5\left[1 + a\left(\bar{\lambda} - 0.2\right) + \bar{\lambda}^2\right] = 0.5\left[1 + 0.21\left(1.834 - 0.2\right) + (1.834)^2\right] = 2.354$$

$$\chi = \frac{1}{\Phi + \sqrt{\Phi^2 - \bar{\lambda}^2}} = 0.2611$$

$$N_{b,Rd} = 0.2611 \times 2{,}670 \times 275 / 1.0 = 191.7 \text{ kN}$$

The compression capacity is the minimum of $N_{c,Rd}$ and $N_{b,Rd}$, thus: $N_{c,Rd} = 191.7\ kN$.

No axial compression in section, so by observation no need to check ratio.

<u>Bending Capacity</u>

Maximum bending moment in the section (center third of span): $M_{Ed} = 20.0\ kN{\cdot}m$.

Check for bending capacity per Cl. 6.2.5:

For a Class 1 section:

$$M_{c,Rd} = W_{ply} \times f_y / \gamma_{M0} = 90.6 \times 275 / 1.0 \times (10)^{-3} = 24.92 \text{ kN}{\cdot}\text{m}$$

Ratio per Eq. 6.12: $M_{Ed}\ /\ M_{c,Rd} = 20.0\ /\ 24.92 = 0.803$

<u>Shear Capacity</u>

Maximum shear in the section: $V_{Ed} = 10\ kN$

$$A_v = 2A / \pi = 1{,}700 \text{ mm}^2$$

Check for shear capacity per Cl. 6.2.6 for plastic design (Class 1):

$$V_{c,Rd} = V_{pl,Rd} = A_v \times \left(f_y / \sqrt{3} \right) / \gamma_{M0} = 1{,}700 \times \left(275 / \sqrt{3} \right) / 1.0 = 269.9 \text{ kN}$$

Ratio per Eq. 6.17: $V_{Ed}\ /\ V_{c,Rd} = 10.0\ /\ 26.9 = 0.037$

<u>Lateral Torsional Buckling</u>

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2}\left[\sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_z} + \frac{(kL)^2 GI_t}{\pi^2 EI_z} + (C_2 Z_g)^2} - C_2 Z_g\right]$$

where

C_1	=	1.0
C_2	=	1.0
$\frac{\pi^2 EI_y}{(kL)^2}$	=	$213,000$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	0
$\frac{(kL)^2 GI_T}{\pi^2 EI_y}$	=	$2,806,000$
$C_2 Z_g$	=	$1.0 \times 114.3 / 2 = 57.15$

Therefore, $M_{cr} = 1.0 \times 213,000\left[\sqrt{0 + 2,806,000 + 57.15^2} - 57.15\right] = 344.8\ kN \cdot m$

For CHS sections, $\chi_{LT} = 1.0$.

$$M_{b,Rd} = \chi_{LT} W_y \times f_y / \gamma_{M1} = 1.0 \times 90.6 \times 275 / 1.0 \times (10)^{-3} = 24.92\ \mathrm{kN \cdot m}$$

Ratio per Eq. 6.12: $M_{Ed} / M_{b,Rd} = 20.0 / 24.92 = 0.803$

Results

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 - Pipe Section with Conc Load.std` is typically installed with the program.

The following design parameters are used:

- Symmetric point loads about mid-span: `CMM 5`
- Use Cl. 6.3.2.2 to determine χ_{LT}: `MTH 1`
- The values of `C1 1.0` and `C2 1.0` are specified.
- The values of F_y and F_u are specified directly using `PY 275000` and `FU 295000`.

V. EC3 - Simply supported laterally unrestrained beam

Verify the design of a pinned column per the EC3 2005 design code.

Details

The beam is a 5.7 m simply supported span. The member is a UKB 356 x171 x51shape with S275 grade steel. The member is uniformly loaded with 9.58 kN/m dead load and 6.25 kN/m live load.

Partial safety factors:

$\Gamma_{M0} = 1.0$

$\Gamma_{M1} = 1.0$

Validation

Factored Loads

$w = 1.35 (9.58) + 1.5 (6.25) = 22.31$ kN/m

$M_{z,Ed} = 22.31 (5.7)^2 / 8 = 90.6$ kN·m

$V_{z,Ed} = 22.31 (5.7)/2 = 63.58$ kN

Yield Strength

Steel grade S275

The maximum thickness = *15.4 mm < 40 mm*; therefore *fy = 275 N/mm²* *[EN 1993-1-1:2005 Table 3.1]*

Section Classification

$\varepsilon = \sqrt{(235/fy)} = 0.92$ [EN 1993-1-1:2005 Table 5.2]

Outstanding flange (flange under uniform compression):

$c = (b-t_w-2r)/2 = (171.5 – 7.4 – 2 \times 10.2)/2 = 71.85$ mm

$c /t_f = 71.85 / 11.5 = 6.25 < 9 \varepsilon$

Class 1 element *[EN 1993-1-1:2005 Table 5.2 Sheet 2]*

Internal compression part (web in bending):

$c = h-2t_f-2r = 355-2 \times 11.5 – 2 \times 10.2 = 311.6$ mm

$c / t_w = 311.6 / 7.4 = 42.1 < 72 \varepsilon$

Class 1 element *[EN 1993-1-1:2005 Table 5.2 Sheet 1]*

Therefore, section is a Class 2 section.

Moment Resistance

Design bending resistance:

$M_{c,\,Rd} = W_{pl} \times fy/\Gamma_{m0} = 896\ cm^3(10^3)\times 275\ kN/mm^2 / 1.0 \times 10^{-6} = 246.4\ kN\cdot m > 90.6\ kN\cdot m$ [EN 1993-1-1:2005 Cl. 6.2.4]

Ratio *90.6 / 246.4 = 0.368*

Lateral Torsional Buckling

Determine the elastic critical moment, M_{cr}:

$$M_{cr} = C1\frac{\pi^2 E\, I_y}{(kl)^2}\left\{\sqrt{\left[\left(\frac{k}{Kw}\right)^2\left(\frac{Iw}{Iy}\right) + \frac{(kl)^2 GIt}{\pi^2 E\, I_y} + (C2z_g)^2\right]} - C2z_g\right\}$$ [EN 1993-1-1:2005 Annex F]

where

k	=	$kw = 1$
z_g	=	h/2 = 177.5 mm
$C1$	=	1.132 [EN 1993-1-1:2005 Table F.1.2]
$C2$	=	0.459 [EN 1993-1-1:2005 Table F.1.2]

$M_{cr} = 121.74\ kN\cdot m$

$$\lambda_{LT} = \sqrt{W_{pLz} \times fy / M_{cr}} = \sqrt{\frac{896,\ 000 \times 275}{121.74(10)^6}} = 1.423$$

$h/b = 355 / 171.5 = 2.07 > 2$

Use buckling curve c. *[EN 1993-1-1:2005 Cl. 6.3.2.3 & Table 6.5]*

$\alpha_{LT} = 0.49$ [EN 1993-1-1:2005 Table 6.3]

$\phi = 0.5\ [1 + \alpha(\lambda_{LT} - \lambda_{LT0}) + \beta\lambda^2]$ [EN 1993-1-1:2005 Cl. 6.3.2.3]

$\phi = 0.5\ [1 + 0.49(1.423 - 0.4) + 0.75\times 1.423^2] = 1.510$

$$\chi_{LT} = \frac{1}{\varnothing_{LT} + \sqrt{(\varnothing_{LT}{}^2 - \lambda_{LT}{}^2)}} = \frac{1}{1.510 + \sqrt{(1.510^2 - 1.423^2)}} = 0.420 < 1.0$$

$\chi_{LT} = 0.420 < 0.494$OK

$f = 1 - 0.5\ (1 - kc)[1 - 2(\lambda_{LT} - 0.8)^2] = 0.99 < 1$

where

kc	=	0.94

$\chi_{LT} = \chi_{LT} / f = 0.42$

$M_{b,\,Rd} = \chi_{LT} W_{pl,z} \times fy/\Gamma_{m1} = 0.42\times 896\ cm^3(10^3)\times 275\ kN/mm^2 / 1.0 \times 10^{-6} = 103.5\ kN\cdot m > 90.6\ kN\cdot m$ [EN 1993-1-1:2005 Cl. 6.2.4]

Ratio = *90.6 / 103.5 = 0.875*

Check Shear Resistance

In the absence of torsion shear area

$A_v = A - 2bt_f + (t_w + 2r)\ t_f = 6490 - 2 \times 171.5\times 11.5 + (7.4+2 \times 10.2) \times 11. = 2,865\ mm^2$

$\eta\ h_w\ t_w = 1 \times 332 \times 7.4 = 2,457\ mm^2 > A_v$

Shear plastic resistance

$V_{pl,Rd} = A_v\ (fy/\sqrt{3})/\ \Gamma_{M0} = 2,865 \times (275/\sqrt{3}) / 1.0 = 454.9\ kN > 63.58\ kN$

Ratio = $63.58 \;/\; 454.9 = 0.140$

$hw / tw = 332/7.4 = 44.86 < 66.24$ (i.e. 72 ε) [EN 1993-1-1:2005 Cl. 6.2.6(6)]

Hence shear buckling check not required.

$V_{Ed} = 63.58 < 0.5 \times 454.9$ [EN 1993-1-1:2005 Cl. 6.2.8(2)]

Hence combined shear and bending checks not required.

<u>Check for Deflection Under Service Load</u>

$G + Q = 9.58 + 6.25 = 15.83$ kN/m

$$\delta = \frac{5 \times 15.83 \times 5,\ 700^4}{384 \times 205,\ 000 \times 14,\ 135(10)^4} = 7.3 \text{ mm} < L \;/300 = \frac{5,\ 700}{300} = 19 \text{ mm}$$

Results

Table 635: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Ratio for Bending	0.368	0.368	none	
Ratio for LTB	0.875	0.877	negligible	
Ratio for Shear	0.140	0.140	none

V. EC3 - Tube Section with Axial Load

Verify the adequacy of a cantilever tube section subject to axial force and bending per EN 1993-1-1:2005 (no national annex used).

Details

The member is a 5 m long cantilever. The member is subject to a 25 kN axial compressive load along with moments of 10 kN·m about the major axis and 5 kN·m about the minor axis at the free end. The steel is grade S275. The section is a European TUB120806.

Section Properties

$A = 23.4\ cm^2$
Depth, D = 120 mm
Width, B = 80 mm
t = 6.3 mm
$I_z = 447\ cm^4$
$I_y = 234\ cm^4$
$Z_z = 91\ cm^3$
$Z_y = 68.2\ cm^3$
$J = 486\ cm^4$
$C_w = 0\ cm^6$

$$r_z = \sqrt{I_z / A} = \sqrt{\frac{447}{23.4}} = 4.371\ cm$$

$$r_y = \sqrt{I_y / A} = \sqrt{\frac{234}{23.4}} = 3.162\ cm$$

Partial safety factors:

$$\Gamma_{M0} = 1.0$$

$$\Gamma_{M1} = 1.0$$

$$\Gamma_{M2} = 1.25$$

Validation

Section Classification

$$\alpha = 1$$

$$C = D - 2t = 120 - 2 \times 6.3 = 107.4\ mm$$

$$\varepsilon = \sqrt{\frac{235}{f_y}} = \sqrt{\frac{235}{275}} = 0.924$$

As per Table 5.2:

$$C / t = 107.4 / 6.3 = 17.05 < 50\times\varepsilon^2 = 50\ (0.924)^2 = 42.7$$

$$C/t = \frac{107.4}{6.3} = 17.05 < \frac{396\varepsilon}{13a - 1} = 30.36$$

Hence, this is a Class 1 section.

<u>Slenderness Ratio</u>

The slenderness ratio = $kL / r = 1 \times 5{,}000 / 31.62 = 158.1$

<u>Axial Tension</u>

Determine axial tension capacity per Cl. 6.2.3.

$$N_{pl,Rd} = A_g \times f_y / \gamma_{M0} = 2{,}340 \times 275 / 1.0 \times (10)^{-3} = 643.5 \text{ kN}$$

$$N_{u,Rd} = 0.9 A_{net} \times f_u / \gamma_{M2} = 0.9 \times 2{,}340 \times 295 / 1.25 \times (10)^{-3} = 497.0 \text{ kN}$$

The tensile capacity is the minimum of $N_{pl,Rd}$ and $N_{u,Rd}$, thus: $N_{t,Rd} = 497.0\ kN$.

No axial tension in section, so by observation no need to check ratio.

<u>Axial Compression</u>

Determine axial compression capacity per Cl. 6.2.4 for a Class 1 section.

$$N_{c,Rd} = A_g \times f_y / \gamma_{M0} = 2{,}340 \times 275 / 1.0 \times (10)^{-3} = 643.5 \text{ kN}$$

Next, check the flexural buckling resistance per Cl. 6.3.1.3:

$$N_{b,Rd} = \chi \times A \times f_y / \gamma_{M1}$$

From Table 6.1: the imperfection factor, $a = 0.21$.

Along the Z axis:

$$\bar{\lambda}_z = \sqrt{A \times f_y / N_{cr}} = L_{cr} / i_z \times \lambda_1$$

where

L_{cr}	=	5,000 mm
i_z	=	43.71 mm
λ_1	=	$93.9\times\varepsilon = 93.9 \times 0.924 = 86.8$

$$\bar{\lambda}_z = 1.318$$

$$\Phi = 0.5\left[1 + a\left(\bar{\lambda}_z - 0.2\right) + \bar{\lambda}_z^2\right] = 0.5\left[1 + 0.21\left(1.318 - 0.2\right) + (1.318)^2\right] = 1.486$$

$$\chi_z = \frac{1}{\Phi + \sqrt{\Phi^2 - \bar{\lambda}_z^2}} = 0.4605$$

$$N_{b,Rd} = 0.4605 \times 2{,}340 \times 275 / 1.0 = 296.3 \text{ kN}$$

Along the Y axis:

$$\bar{\lambda}_y = \sqrt{A \times f_y / N_{cr}} = L_{cr} / i_y \times \lambda_1$$

where

i_y	=	31.62 mm

$$\bar{\lambda}_z = 1.822$$

$$\Phi = 0.5\left[1 + a\left(\bar{\lambda}_y - 0.2\right) + \bar{\lambda}_y^2\right] = 0.5\left[1 + 0.21\left(1.822 - 0.2\right) + (1.822)^2\right] = 2.330$$

$$\chi_y = \frac{1}{\Phi + \sqrt{\Phi^2 - \lambda_y^2}} = 0.2644$$

$$N_{\mathrm{b,Rd}} = 0.2644 \times 2{,}340 \times 275 / 1.0 = 170.2 \text{ kN}$$

The compression capacity is the minimum of $N_{c,Rd}$ and $N_{b,Rd}$, thus: $N_{c,Rd} = 170.2\ kN$.

Ratio per Eq. 6.9: $M_{Ed} / M_{c,Rd} = 25.0 / 170.2 = 0.147$

<u>Bending Capacity</u>

Along Z axis:

Maximum bending moment in the section: $M_{Ed,z} = 10.0\ kN{\cdot}m$.

Check for bending capacity per Cl. 6.2.5:

For a Class 1 section:

$$M_{\mathrm{c,Rd}} = W_{\mathrm{ply}} \times f_y / \gamma_{\mathrm{M0}} = 91 \times 275 / 1.0 \times (10)^{-3} = 25.03 \text{ kN}{\cdot}\text{m}$$

Ratio per Eq. 6.12: $M_{Ed} / M_{c,Rd} = 10.0 / 25.03 = 0.400$

Along Y axis:

Maximum bending moment in the section: $M_{Ed,y} = 5.0\ kN{\cdot}m$.

Check for bending capacity per Cl. 6.2.5:

For a Class 1 section:

$$M_{\mathrm{c,Rd}} = W_{\mathrm{ply}} \times f_y / \gamma_{\mathrm{M0}} = 68.2 \times 275 / 1.0 \times (10)^{-3} = 18.76 \text{ kN}{\cdot}\text{m}$$

Ratio per Eq. 6.12: $M_{Ed} / M_{c,Rd} = 5.0 / 18.76 = 0.267$

<u>Shear Capacity</u>

Along Z direction:

$$A_v = \frac{A \times B}{D + B} = \frac{2{,}340 \times 80}{120 + 80} = 936 \text{ mm}^2$$

Check for shear capacity per Cl. 6.2.6 for plastic design (Class 1):

$$V_{\mathrm{c,Rd}} = V_{\mathrm{pl,Rd}} = A_v \times \left(f_y / \sqrt{3} \right) / \gamma_{\mathrm{M0}} = 936 \times \left(275 / \sqrt{3} \right) / 1.0 = 148.6 \text{ kN}$$

Along Y direction:

$$A_v = \frac{A \times D}{D + B} = \frac{2{,}340 \times 120}{120 + 80} = 1{,}404 \text{ mm}^2$$

Check for shear capacity per Cl. 6.2.6 for plastic design (Class 1):

$$V_{\mathrm{c,Rd}} = V_{\mathrm{pl,Rd}} = A_v \times \left(f_y / \sqrt{3} \right) / \gamma_{\mathrm{M0}} = 1{,}404 \times \left(275 / \sqrt{3} \right) / 1.0 = 222.9 \text{ kN}$$

No shear in section, so by observation no need to check ratio.

<u>Lateral Torsional Buckling</u>

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left[\sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_z} + \frac{(kL)^2 G I_t}{\pi^2 E I_z} + (C_2 Z_g)^2} - C_2 Z_g \right]$$

where

C_1	=	*1.0*
C_2	=	*1.0*
$\frac{\pi^2 E I_y}{(kL)^2}$	=	*189,400*
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	*0*
$\frac{(kL)^2 G I_T}{\pi^2 E I_y}$	=	*2,023,000*
$C_2 Z_g$	=	*1.0×40 = 40*

Therefore, $M_{cr} = 1.0 \times 189,400 \left[\sqrt{0 + 2,023,000 + 40^2} - 40\right] = 261.8\ kN \cdot m$

As per Cl. 6.3.2.1, tube sections are not susceptible to lateral-torsional buckling, so $\chi_{LT} = 1.0$.

$$M_{\mathrm{b,Rd}} = \chi_{\mathrm{LT}} W_y \times f_y / \gamma_{\mathrm{M1}} = 1.0 \times 91 \times 275 / 1.0 \times (10)^{-3} = 25.03\ \mathrm{kN \cdot m}$$

Ratio per Eq. 6.12: $M_{Ed}\ /\ M_{b,Rd} = 10.0\ /\ 24.92 = 0.400$

<u>Check for Interaction</u>

From Table B.3 in Annex B of EC3:

$$\Psi = 1.0$$

$$\mathrm{C_{my}} = \mathrm{C_{mz}} = \mathrm{C_{mLT}} = 0.6 + 0.4 \times \Psi = 1.0$$

$$\mathrm{N_{Rk}} = \mathrm{A} \times \mathrm{f_y} = 643.5\ \mathrm{kN}$$

From Table B.1 of Annex B, the interaction factors:

$$K_{\mathrm{zz}} = C_{\mathrm{mz}} \frac{1 + (\lambda_z - 0.2) N_{\mathrm{Ed}}}{\chi_z N_{\mathrm{Rk}} \gamma_{\mathrm{M1}}} = 1.0 \frac{1 + (1.318 - 0.2)25}{0.4605 \times 643.51} = 1.094 > 1 + \frac{0.8 N_{\mathrm{Ed}}}{\chi_z N_{\mathrm{Rk}} \gamma_{\mathrm{M1}}} = 1.067$$

$$\mathrm{K_{zz}} = 1.067$$

$$K_{\mathrm{yy}} = C_{\mathrm{my}} \frac{1 + (\lambda_y - 0.2) N_{\mathrm{Ed}}}{\chi_y N_{\mathrm{Rk}} \gamma_{\mathrm{M1}}} = 1.0 \frac{1 + (1.822 - 0.2)25}{0.2644 \times 643.51} = 1.238 > 1 + \frac{0.8 N_{\mathrm{Ed}}}{\chi_y N_{\mathrm{Rk}} \gamma_{\mathrm{M1}}} = 1.118$$

$$\mathrm{K_{yy}} = 1.118$$

$$\mathrm{K_{yz}} = 0.6 \times \mathrm{K_{zz}} = 0.641$$

$$\mathrm{K_{zy}} = 0.6 \times \mathrm{K_{yy}} = 0.671$$

For K_{yz}, consider Table B.2 as well:

$$K_{\mathrm{yz}} = 1 - \frac{0.1 \lambda_y}{C_{\mathrm{mLT}} - 0.25} \frac{N_{\mathrm{Ed}}}{\chi_y N_{\mathrm{Rk}} \gamma_{\mathrm{M1}}} = 0.964 < 1 - \frac{0.1}{C_{\mathrm{mLT}} - 0.25} \frac{N_{\mathrm{Ed}}}{\chi_y N_{\mathrm{Rk}} \gamma_{\mathrm{M1}}} = 0.980$$

So, $K_{yz} = 0.980$

Check for Clause 6.3.3-661:

$$\frac{N_{\mathrm{Ed}}}{\chi_z \frac{N_{\mathrm{Rk}}}{\gamma_{\mathrm{M1}}}} + K_{\mathrm{zz}} \frac{M_{\mathrm{z,Ed}}}{\chi_{\mathrm{LT}} \frac{M_{\mathrm{z,Rk}}}{\gamma_{\mathrm{M1}}}} + K_{\mathrm{zy}} \frac{M_{\mathrm{y,Ed}}}{\frac{M_{\mathrm{y,Rk}}}{\gamma_{\mathrm{M1}}}} = \frac{25}{0.4605 \times 643.5} + 1.067 \frac{10}{1.0 \times 25.03} + 0.671 \frac{5}{18.76} = 0.690$$

Check for Clause 6.3.3-662:

$$\frac{N_{\mathrm{Ed}}}{x_y \frac{N_{\mathrm{Rk}}}{\gamma_{\mathrm{M1}}}} + K_{\mathrm{yz}} \frac{M_{\mathrm{z,Ed}}}{x_{\mathrm{LT}} \frac{M_{\mathrm{z,Rk}}}{\gamma_{\mathrm{M1}}}} + K_{\mathrm{yy}} \frac{M_{\mathrm{y,Ed}}}{\frac{M_{\mathrm{y,Rk}}}{\gamma_{\mathrm{M1}}}} = \frac{25}{0.2644 \times 643.5} + 0.980 \frac{10}{1.0 \times 25.03} + 1.118 \frac{5}{18.76} = 0.837$$

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 - Tube Section with Axial Load.std` is typically installed with the program.

The following design parameters are used:

- Fixed end supports: `CMM 2`
- Cantilever member: `CMN 0.7`
- Use Cl. 6.3.2.2 to determine χ_{LT}: `MTH 1`
- The values of `C1 1.0` and `C2 1.0` are specified.
- The values of F_y and F_u are specified directly using `PY 275000` and `FU 295000`.

V. EC3 - Tube Section with UDL

Verify the adequacy of a tube section used as a beam subject to a uniform load per EN 1993-1-1:2005 (no national annex used).

Details

The member is a 5 m long beam with fixed ends. The member is subject to a 10 kN/m uniform load. The steel is grade S275. The section is a European TUB1201205.

Section Properties

$A = 22.9\ cm^2$
Depth, D = 120 mm
Width, B = 120 mm
t = 5 mm
$I_z = I_y = 503\ cm^4$
$Z_z = Z_y = 97.6\ cm^3$
$C_w = 0\ cm^6$

$$r_z = r_y = \sqrt{I/A} = \sqrt{\frac{503}{22.9}} = 4.687\ \ cm$$

Partial safety factors:

$$\Gamma_{M0} = 1.0$$

$$\Gamma_{M1} = 1.0$$

$$\Gamma_{M2} = 1.25$$

Validation

Section Classification

$$\varepsilon = \sqrt{\frac{235}{f_y}} = \sqrt{\frac{235}{275}} = 0.924$$

As per Table 5.2:

$$\alpha = 1$$

$$C = D - 2 \times t = 110\ mm$$

$$C/t = \frac{110}{5} = 22 < \frac{396 \times \varepsilon}{13a - 1} = \frac{396 \times 0.924}{12} = 30.36$$

Hence, this is a Class 1 section.

Slenderness Ratio

The slenderness ratio = $kL / r = 1 \times 5{,}000 / 46.87 = 106.7$

Axial Tension

Determine axial tension capacity per Cl. 6.2.3.

$$N_{\mathrm{pl,Rd}} = A_g \times f_y / \gamma_{\mathrm{M0}} = 2{,}290 \times 275 / 1.0 \times (10)^{-3} = 630.0 \text{ kN}$$

$$N_{\mathrm{u,Rd}} = 0.9A_{\mathrm{net}} \times f_u / \gamma_{\mathrm{M2}} = 0.9 \times 2{,}290 \times 450 / 1.25 \times (10)^{-3} = 742.0 \text{ kN}$$

The tensile capacity is the minimum of $N_{pl,Rd}$ and $N_{u,Rd}$, thus: $N_{t,Rd} = 630.0\ kN$.

No axial tension in section, so by observation no need to check ratio.

Axial Compression

Determine axial compression capacity per Cl. 6.2.4 for a Class 1 section.

$$N_{\mathrm{c,Rd}} = A_g \times f_y / \gamma_{\mathrm{M0}} = 2{,}290 \times 275 / 1.0 \times (10)^{-3} = 630.0 \text{ kN}$$

Next, check the flexural buckling resistance per Cl. 6.3.1.3:

$$N_{\mathrm{b,Rd}} = \chi \times A \times f_y / \gamma_{\mathrm{M1}}$$

From Table 6.1: the imperfection factor, $a = 0.21$.

$$\bar{\lambda} = \sqrt{A \times f_y / N_{\mathrm{cr}}} = L_{\mathrm{cr}} / i \times \lambda_1$$

where

L_{cr}	=	5,000 mm
i	=	46.87 mm
λ_1	=	$93.9 \times \varepsilon = 93.9 \times 0.924 = 86.8$

$$\bar{\lambda} = 1.229$$

$$\Phi = 0.5\left[1 + a\left(\bar{\lambda} - 0.2\right) + \bar{\lambda}^2\right] = 0.5\left[1 + 0.21\left(1.229 - 0.2\right) + (1.229)^2\right] = 1.363$$

$$\chi = \frac{1}{\Phi + \sqrt{\Phi^2 - \bar{\lambda}^2}} = 0.512$$

$$N_{\mathrm{b,Rd}} = 0.512 \times 2{,}290 \times 275 / 1.0 = 322.4 \text{ kN}$$

The compression capacity is the minimum of $N_{c,Rd}$ and $N_{b,Rd}$, thus: $N_{c,Rd} = 322.4\ kN$.

No axial compression in section, so by observation no need to check ratio.

Bending Capacity

Maximum bending moment in the section (at fixed supports): $M_{Ed} = 20.83\ kN{\cdot}m$.

Check for bending capacity per Cl. 6.2.5:

For a Class 1 section:

$$M_{\mathrm{c,Rd}} = W_{\mathrm{ply}} \times f_y / \gamma_{\mathrm{M0}} = 97.6 \times 275 / 1.0 \times (10)^{-3} = 26.84 \text{ kN}{\cdot}\text{m}$$

Ratio per Eq. 6.12: $M_{Ed} / M_{c,Rd} = 20.83 / 26.84 = 0.776$

Shear Capacity

Maximum shear in the section (at fixed supports): $V_{Ed} = 25\ kN$

$$A_v = \frac{A \times D}{D + B} = \frac{2{,}290 \times 120}{120 + 120} = 1{,}145\ \text{mm}^2$$

Check for shear capacity per Cl. 6.2.6 for plastic design (Class 1):

$$V_{c,Rd} = V_{pl,Rd} = A_v \times \left({}^{f_y}\!/\!_{\sqrt{3}}\right) / \gamma_{M0} = 1{,}145 \times \left({}^{275}\!/\!_{\sqrt{3}}\right) / 1.0 = 181.8\ \text{kN}$$

Ratio per Eq. 6.17: $V_{Ed}\ /\ V_{c,Rd} = 25.0\ /\ 181.8 = 0.138$

Lateral Torsional Buckling

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL\ )^2}\left[\sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_z} + \frac{(kL\ )^2 GI_t}{\pi^2 EI_z} + (C_2 Z_g)^2} - C_2 Z_g\right]$$

where

C_1	=	1.0
C_2	=	1.0
$\frac{\pi^2 EI_y}{(kL\ )^2}$	=	162,800
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	0
$\frac{(kL\ )^2 GI_T}{\pi^2 EI_y}$	=	375,300
$C_2 Z_g$	=	$1.0 \times 60 = 60$

Therefore, $M_{cr} = 1.0 \times 162{,}800\left[\sqrt{0 + 375{,}300 + 60^2} - 60\right] = 904.6\ kN \cdot m$

From Table 6.4, buckling curve "d" is used. From Table 6.3, $a_{LT} = 0.76$ for buckling curve d.

As per Cl. 6.3.2.1, tube sections are not susceptible to lateral-torsional buckling, so $\chi_{LT} = 1.0$.

$$M_{b,Rd} = \chi_{LT} W_y \times f_y / \gamma_{M1} = 1.0 \times 97.6 \times 275 / 1.0 \times (10)^{-3} = 26.84\ \text{kN} \cdot \text{m}$$

Ratio per Eq. 6.12: $M_{Ed}\ /\ M_{b,Rd} = 20.83\ /\ 26.84 = 0.776$

Results

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 - Tube Section with UDL.std` is typically installed with the program.

The following design parameters are used:

- Fixed end supports with a uniform load: `CMM 2`
- Fixed end supports: `CMN 0.5`
- Use Cl. 6.3.2.2 to determine χ_{LT}: `MTH 1`
- The values of `C1 1.0` and `C2 1.0` are specified.
- The values of F_y and F_u are specified directly using `PY 275000` and `FU 295000`.

V. EC3 Belgian NA - Channel Section with Conc Load

Calculate the bending capacity of a channel section beam under subject to a pair of concentrated load per the Belgian NA to EC3

Details

The section is a C15X50, grade S275 steel. The member is a 6 m span, simply supported beam is subject to two concentrated loads of 10 kN each at the 1/3 points (2 m from either support).

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{1{,}123(10)^3 275}{1.0(10)^6} = 308.7 \text{ kN}\cdot\text{m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(k_z L)^2}\left[\sqrt{\left(\frac{k_z}{k_w}\right)^2 \frac{I_w}{I_z} + \frac{(k_z L)^2 G I_T}{\pi^2 E I_z} + (C_2 Z_g - C_3 Z_j)^2} - (C_2 Z_g - C_3 Z_j)\right]$$

where

C_1	=	1.046
C_2	=	0.42
C_3	=	1.0

$\frac{\pi^2 EI_y}{(kL)^2}$ = $257,320$

$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$ = $28,852$

$\frac{(kL)^2 GI_T}{\pi^2 EI_y}$ = $330,055$

C_2Z_g = $0.42 \times 0.5 \times 381 = 80.01$

β_f = $\frac{b_c^3 + t_c}{b_c^3 + t_c + b_t^3 + t_t} = 0.5$ (From SN030a-EN-EU)

Z_j = $0.4 \times h_s (2 \times \beta_f - 1) = 0$, since $\beta_f \geq 0.5$

C_3Z_j = $1.0\ (0) = 0$

Therefore, $M_{cr} = 1.046 \times 257,320 \left[\sqrt{28,852 + 330,055 + (80.01)^2} - (80.01)\right] = 141.2\ kN \cdot m$

Results

Table 638:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	308.7	308.7	none	
Critical moment, M_{cr} (kN·m)	141.2	142.2	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Belgian NA - Channel Section with Conc Load.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The Belgian NA is specified using `NA 8`
- Simply-supported span: `CMN 1` and `C3 1`
- Concentrated loads at 1/3 points supports: `CMM 5`
- The value of `C2 0.42` is specified

V. EC3 Belgian NA - Column with Axial Load

Calculate the axial and bending capacities and interaction ratios of a column using the Belgian NA to EC3.

Details

The 5 m tall column as a fixed base and is free to translate and rotate at the top. The column is subject to a 25 kN compressive load and moments of 5 kN·m about the X axis and 10 kN·m about the Z axis. The section is an HD320X127, grade S275 steel.

Validation

<u>Bending Capacity</u>

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149(10)^3 275}{1.0(10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 GI_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	*2.578*
C_2	=	*1.554*
$\frac{\pi^2 EI_y}{(kL)^2}$	=	*7,477,200*
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	*22,394*
$\frac{(kL)^2 GI_t}{\pi^2 EI_y}$	=	*23,740*
$C_2 Z_g$	=	*1.554×160 = 248.6*

Therefore, $M_{cr} = 1{,}540.6\ kN{\cdot}m$

From the Belgian NA, $\lambda_{LT,0} = 0.4, \beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times 10^3 \times 275}{1{,}540.6 \times 10^6}} = 0.619$

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.5 of Eurocode 3, $\alpha_{LT} = 0.34$.

From Cl. 6.3.2.3 of Eurocode3:

$\Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - \lambda_{LT,0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34\times(0.619 - 0.4) + 0.75 \times 0.619^2] = 0.681$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta\lambda_{LT}^2}\right)^{-1} = 0.908$

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.908 \times 2{,}149(10)^3 \times 275}{1.0} = 536.8 \text{ kN·m}$$

Compression Capacity

Critical compressive values:

$$N_{cry} = \sqrt{\frac{\pi^2 EI_y}{(kl)^2}} = 7{,}477 \text{ kN}$$

$$N_{crz} = \sqrt{\frac{\pi^2 EI_z}{(kl)^2}} = 24{,}943 \text{ kN}$$

$$\lambda_{cy} = \sqrt{\frac{A \times f_y}{N_{cry}}} = 0.770$$

$$\lambda_{cz} = \sqrt{\frac{A \times f_y}{N_{crz}}} = 0.422$$

Determine χ_y

$h/b = 1.067 < 1.2$ and $t_f = 20.5\ mm < 100\ mm$

So, for y-y axis, use curve "c". Hence, $\alpha = 0.49$ [Table 6.2, EC3]

So, $\phi = 0.5[1+\alpha\ (\lambda - 0.2) +\lambda^2)] = 0.936$

$$\chi_y = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}}\ 0.681 \quad \text{(governs)}$$

Determine χ_z

$h/b = 1.067 < 1.2$ and $t_f = 20.5\ mm < 100\ mm$

So, for z-z axis, use curve "b". Hence, $\alpha = 0.34$ [Table 6.2, EC3]

So, $\phi = 0.5[1+\alpha\ (\lambda - 0.2) +\lambda^2)] = 0.627$

$$\chi_z = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}}\ 0.917 \quad \text{(does not govern)}$$

Compression capacity:

$$\chi_y \times N_{Rk} = 0.681 \times 7{,}477 = 3{,}020.2\ \text{kN}$$

Compression ratio: $25\ kN\ /\ 3{,}020.2\ kN = 0.008$

<u>Critical Axial Loads for Flexure and Flexural Torsional Buckling</u>

From NCCI document SN001a-EN-FU:

$$N_{cr,T} = \frac{1}{i_0^2}\left(GI_t + \frac{\pi^2 EI_w}{l_T^2}\right)$$

where

$$i_o^2 = i_y^2 + i_z^2 + y_o^2 + z_o^2;\ \text{here } y_0 = z_0 = 0$$

$i_y = 75.68\ mm$ and $i_z = 138.23\ mm$

$$= 24{,}835\ \text{mm}^2$$

$$N_{cr,T} = \frac{1}{24{,}835}\left[\frac{20{,}500 \times 225.1(10)^4}{2.6} + \frac{\pi^2(205{,}000)2.069(10)^{12}}{5{,}000^2}\right] = 13{,}889\ \text{kN}$$

$$N_{cr,TF} = \frac{i_0^2}{2\left(i_y^2 + i_z^2\right)}\left[N_{cr,y} + N_{cr,T} - \sqrt{\left(N_{cr,y} + N_{cr,T}\right)^2 - 4N_{cr,y}N_{cr,T}\frac{i_y^2 + i_z^2}{i_0^2}}\right]$$

$$= \frac{1}{2}\left[24{,}943 + 13{,}889 - \sqrt{(24{,}943 + 13{,}889)^2 - 4\left(24{,}943\right)\left(13{,}889\right)^1/_1}\right] = 13{,}889\ \text{kN}$$

<u>Interaction Check</u>

From Annex A, Table A.1 of EC3, the auxiliary terms:

$$\mu_z = \frac{1 - \frac{N_{Ed}}{N_{crz}}}{1 - \chi_z * \frac{N_{Ed}}{N_{crz}}} = 0.9999$$

$$\mu_y = \frac{1 - \frac{N_{Ed}}{N_{cry}}}{1 - x_y * \frac{N_{Ed}}{N_{cry}}} = 0.9989$$

$\chi_{LT} = 0.908294$

$W_z = w_{plz}/w_{elz} = 2149/1926 = 1.1158$

$W_y = w_{ply}/w_{ely} = 939/615.933 = 1.525 > 1.5$, so, $w_y = 1.5$

$\psi=1.0$

$$c_{mz,0} = 0.79 + 0.21 \times 1 + 0.36(1 - 0.33)\frac{25}{24{,}942} = 1.0002$$

Also, $c_{mz,0} > 1 - \frac{N_{Ed}}{N_{cr,z}}$, OK

$$c_{my,0} = 0.79 + 0.21 \times 1 + 0.36(1 - 0.33)\frac{25}{7{,}477} = 1.0008$$

Also, $c_{my,0} > 1 - \frac{N_{Ed}}{N_{cr,y}}$, OK

Determination of λ_0

$C_1 = 1$, $C_2 = 0$

$M_{cr} = 1{,}606$ kN

$$\lambda_0 = \sqrt{\frac{2{,}149 \times 10^3 \times 275}{1{,}606 \times 10^6}} = 0.6066$$

$$\lambda_{0,limit} = 0.2\sqrt{C1}\sqrt[4]{\left(1 - \frac{N_{Ed}}{N_{cry}}\right)*\left(1 - \frac{N_{Ed}}{N_{crTF}}\right)} = 0.321$$

$\lambda_0 > \lambda_{0,limit}$

$a_{LT} = 1 - I_t/I_z = 0.993$

$$\varepsilon_z = \frac{M_{Z,Ed}}{N_{Ed}} \times \frac{A}{W_{elz}} = 3.350$$

$$C_{mz} = C_{mz,0} + \left(1 - C_{mz,0}\right)\frac{\sqrt{\varepsilon_Z * a_{LT}}}{1 + \varepsilon_Z * a_{LT}} = 1.000$$

$$C_{my} = C_{my,0} = 1.001$$

$$C_{mLT} = C_{mz}^2 \times \frac{a_{LT}}{\sqrt{\left(1 - \frac{N_{Ed}}{N_{cry}}\right) \times \left(1 - \frac{N_{Ed}}{N_{crT}}\right)}} = 0.995 < 1$$

So, $C_{mLT} = 1.0$

λ_{max} = the maximum of λ_y and λ_z, therefore $\lambda_{max} = \lambda_y = 0.7702$

$$b_{LT} = 0.5a_{LT}\lambda_0^2\frac{M_{yEd}}{x_{LT} \times M_{ply.Rd}} \times \frac{M_{zEd}}{M_{plz.Rd}} = 0.5 \times 0.993 \times 0.6066^2\frac{5 \times 10}{0.908 \times 258.3 \times 591} \cong 0$$

$$\eta_{pl} = \frac{N_{Ed}}{\frac{N_{Rk}}{GM1}} = \frac{25}{4{,}436 / 1.0} = 0.0056$$

$$C_{zz} = 1 = \left(w_z + 1\right)\left[\left(2 - \frac{1.6}{w_Z} C_{mz}{}^2 \lambda_{max} - \frac{1.6}{w_Z} C_{mz}{}^2 \lambda_{max}{}^2\right)\eta_{pl} - b_{LT}\right]$$

$$= 1 + (1.1158 - 1)\left[\left(2 - \frac{1.6}{1.1158} 1^2 \times 0.7702 - \frac{1.6}{1.1158} 1^2 \times 0.7702^2\right)0.00564 - 0\right] \cong 1.0$$

$W_{elz}/W_{plz} = 0.8962 < C_{ZZ}$. So, $C_{ZZ} = 1.0$

$$C_{LT} = 10a_{LT} \frac{\lambda_0{}^2}{5 + \lambda_y{}^4} \times \frac{M_{z,Ed}}{C_{mz} \times x_{LT} \times M_{plz,Rd}} = 0.0127$$

$$C_{zy} = 1 + (w_y - 1)\left[\left(2 - 14 \frac{C_{my}{}^2 \times \lambda_{max}{}^2}{w_y{}^5}\right)\eta_{pl} - C_{LT}\right] = 0.9962$$

Check $C_{zy} > 0.6\sqrt{\frac{W_y}{W_z}} \times \frac{W_{ely}}{W_{ply}} = 0.456$, OK

$$d_{LT} = 2a_{LT} \frac{\lambda_0}{0.1 + \lambda_y{}^4} \times \frac{\mathrm{M_{z,Ed}}}{\mathrm{C_{mz}} \times \chi_{\mathrm{LT}} \times \mathrm{M_{plz,Rd}}} \times \frac{\mathrm{M_{y,Ed}}}{\mathrm{C_{my}} {*} \mathrm{M_{ply,Rd}}}$$

$$= 2 \times 0.9927 \frac{0.6066}{0.1 + 0.7702^2} \times \frac{10}{1 \times 0.9083 \times 591} \times \frac{5}{1.0008 \times 258.3} = 0.00096$$

$$C_{yz} = 1 + (w_z - 1)\left[\left(2 - 14 \frac{C_{mz}{}^2 \times \lambda_{max}{}^2}{w_z{}^5}\right)\eta_{pl} - d_{LT}\right] = 0.9981$$

$$e_{LT} = 1.7a_{LT} \frac{\lambda_0}{0.1 + \lambda_y{}^4} \times \frac{M_{z,Ed}}{\mathrm{C_{mz}} \times \chi_{\mathrm{LT}} \times \mathrm{M_{plz,.Rd}}} = 0.0422$$

$$C_{yy} = 1 + \left(w_y - 1\right)\left[\left(2 - \frac{1.6}{w_y} C_{my}{}^2 \times \lambda_{max} - \frac{1.6}{w_y} \times C_{my}{}^2 \times \lambda_{max}{}^2\right)\eta_{pl} - e_{LT}\right]$$

$$= 1 + (1.5 - 1)\left[\left(2 - \frac{1.6}{1.5} 1.001^2 \times 0.7702 - \frac{1.6}{1.5} 1.001^2 \times 0.7702^2\right)0.00564 - 0.0422\right] = 0.9804$$

$W_{ely}/W_{ply} = 0.656 < C_{yy}$. So, $C_{yy} = 0.9804$

Interaction factors:

$$K_{zz} = C_{mz} C_{mLT} \frac{\mu_z}{1 - \frac{N_{Ed}}{N_{crz}}} \times \frac{1}{C_{zz}} = 1.001$$

$$K_{zy} = C_{my} \frac{\mu_z}{1 - \frac{N_{Ed}}{N_{cry}}} \times \frac{1}{C_{zy}} 0.6\sqrt{\frac{W_y}{W_z}} = 0.7012$$

$$K_{yz} = C_{mz} C_{mLT} \frac{\mu_y}{1 - \frac{N_{Ed}}{N_{crz}}} \times \frac{1}{C_{yz}} 0.6\sqrt{\frac{W_z}{W_y}} = 0.5185$$

$$K_{yy} = C_{my} \frac{\mu_y}{1 - \frac{N_{Ed}}{N_{cry}}} \times \frac{1}{C_{yy}} = 1.023$$

Check for Clause 6.3.3-661:

$$\frac{N_{Ed}}{x_Z \frac{N_{Rk}}{\gamma M_1}} + K_{ZZ} \frac{M_{z,Ed}}{x_{LT} \frac{M_{z,Rk}}{\gamma M_1}} + K_{zy} \frac{M_{y,Ed}}{\frac{M_{y,Rk}}{\gamma M_1}} = \frac{25}{0.9174 \times 4{,}436} + 1.001 \frac{10}{0.9083 \times 591} + 0.7012 \frac{5}{258.3} = 0.038$$

$$\frac{N_{Ed}}{x_y \frac{N_{Rk}}{\gamma M_1}} + K_{yz} \frac{M_{z,Ed}}{x_{LT} \frac{M_{z,Rk}}{\gamma M_1}} + K_{yy} \frac{M_{y,Ed}}{\frac{M_{y,Rk}}{\gamma M_1}} = \frac{25}{0.6809 \times 4{,}436} + 0.519 \frac{10}{0.9083 \times 591} + 1.0231 \frac{5}{258.3} = 0.038$$

Results

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\ Verification Models\09 Steel Design\Europe\EC3 Belgian NA - Column with Axial Load.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The Belgian NA is specified using `NA 8`
- Fixed support: `CMM 2.0`
- Fixed base and free at other end: `CMN 0.7`
- The value of `C2 1.554` is specified

V. EC3 Belgian NA - I Section with Conc Load

Calculate the bending capacity of a beam subject to a concentrated load per the Belgian NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 30 kN concentrated load at midpsan.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	*1.35*
C_2	=	*0.59*
$\frac{\pi^2 E I_y}{(kL)^2}$	=	*7,477,200*
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	*22,394*
$\frac{(kL)^2 G I_t}{\pi^2 E I_y}$	=	*23,737*
$C_2 Z_g$	=	*0.59×160 = 94.4*

Therefore, $M_{cr} = 1{,}416 \ kN \cdot m$

From the Belgian NA, $\lambda_{LT,0} = 0.4, \beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times (10)^3 \times 275}{1{,}416 \times (10)^6}} = 0.646$

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.5 of Eurocode 3, $\alpha_{LT} = 0.34$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - \lambda_{LT,0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34\times(0.646 - 0.4) + 1 \times 0.646^2] = 0.698$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}{}^{2} - \beta\lambda_{LT}{}^{2}}\right)^{-1} = 0.896$

From Table 6.6 of the Eurocode 3, $k_c = 0.9$

Modification factor: $f = 1.0$

$\chi_{LT,mod} = \frac{\chi_{LT}}{f} = 0.896 < \frac{1}{\lambda_{LT}{}^{2}} = 2.396$, OK

$$M_B = \frac{x_{\mathrm{LT}} w_y f_y}{\gamma_{\mathrm{M1}}} = \frac{0.896 \times 2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 529.4 \text{ kN·m}$$

Results

Table 640:

V. EC3 Belgian NA - I Section with UDL

Calculate the bending capacity of a beam using an I section subject to a uniformly distributed load per the Belgian NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN}\cdot\text{m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1 = 2.578

C_2	=	1.554
k	=	0.5
$\frac{\pi^2 E I_y}{(kL)^2}$	=	$29,909,000$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$5,599$
$\frac{(kL)^2 G I_t}{\pi^2 E I_y}$	=	$5,934$
$C_2 Z_g$	=	$1.554 \times 160 = 248.6$

Therefore, $M_{cr} = 1,712\ kN \cdot m$

From the Belgian NA, $\lambda_{LT,\ 0} = 0.2, \beta = 1.0$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2,149 \times (10)^3 \times 275}{1,712 \times (10)^6}} = 0.588$

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.5 of Eurocode 3, $\alpha_{LT} = 0.34$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - \lambda_{LT,\ 0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34\times(0.589 - 0.2) + 1 \times 0.588^2] = 0.739$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta\lambda_{LT}^2}\right)^{-1} = 0.843$

From Table 6.6 of the Eurocode 3, $k_c = 0.9$

Modification factor: $f = 1 - 0.5(1 - k_c)\left[1 - 2(\lambda_{LT} - 0.8)^2\right] = 1 - 0.5(1 - 0.9)\left[1 - 2(0.588 - 0.8)^2\right] = 0.955$

$\chi_{LT,mod} = \frac{\chi_{LT}}{f} = 0.883 < \frac{1}{\lambda_{LT}^2} = 2.897$, OK

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.883 \times 2,149(10)^3 \times 275}{1.0} = 521.8\ \mathrm{kN \cdot m}$$

If Cl. 6.3.2.2 is used to determine χ_{LT}:

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.3 of Eurocode 3, $\alpha_{LT} = 0.21$.

$$\Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - 0.2) + \lambda_{LT}^2] = 0.5[1+0.21\times(0.588 - 0.2) +1\times0.588^2] = 0.713$$

$$\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \lambda_{LT}^2}\right)^{-1} = 0.895$$

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.895 \times 2,149(10)^3 \times 275}{1.0 \times (10)^6} = 528.9\ \mathrm{kN \cdot m}$$

Results

Table 641: Comparison of results for EC3 Belgian NA - I Section with UDL

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	1,712	1,712.9	negligible	
Bending capacity, M_B (kN·m)	521.8	522.1	negligible	
Bending capacity, M_B (kN·m)	528.9	528.8	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Belgian NA - I Section with UDL.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The Belgian NA is specified using `NA 8`
- Fully fixed span: `CMN 0.5`
- Uniformly distributed load w/ fixed-fixed supports: `CMM 2`
- The value of `C2 1.554` is specified
- The parameter KC instructs the program to calculate the value of k_c
- A second design parameter set is used with `MTH 1` to use Cl 6.3.2.2 to determine Φ_{LT}

> **Note:** The previously set parameters are still used as they are not specified again with a different value, which is the default behavior in STAAD.Pro batch design.

V. EC3 Belgian NA - Tee Section

Calculate the bending capacity of a beam using an Tee section subject to a uniformly distributed load and varying end moments per the Belgian NA to EC3.

Details

The section is an Indian INST100 with $f_y = 300\ MPa$. The member is a 5 m, simply-supported span under a 2 kN/m uniform load. The left support has a -5.0 kN·m moment applied and the right support has a 2.5 kN·m moment applied.

Validation

Moment capacity:

$$M_{\text{ckd}} = \frac{W_{\text{ply}} f_y}{\gamma_{M0}} = \frac{45.5 \times (10)^3 \times 300}{1.0 \times (10)^6} = 13.7 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(k_z L)^2} \left[\sqrt{\left(\frac{k_z}{k_w}\right)^2 \frac{I_w}{I_z} + \frac{(k_z L)^2 G I_T}{\pi^2 E I_z} + (C_2 Z_g - C_3 Z_j)^2} - (C_2 Z_g - C_3 Z_j) \right]$$

where

C_1	=	1.0
C_2	=	1.0
C_3	=	1.0
$\frac{\pi^2 E I_y}{(kL)^2}$	=	$64{,}421$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$\left(\frac{1}{1}\right)^2 \frac{30.76}{79.6} = 0.386$
$\frac{(kL)^2 G I_T}{\pi^2 E I_y}$	=	$\frac{(1 \times 5{,}000)^2 \times 205{,}000 \times 7.33 \times (10)^4}{2.6 \times \pi^2 \times 205{,}000 \times 79.6 \times (10)^4} = 89{,}714$
$C_2 Z_g$	=	$1.0 \times 10 \;/\; 2 = 5$
Ψ_f	=	1 ($I_{ft} = 0$, as there is no tension flange present in the Tee section)
h_s	=	D - 0.5×t_f = 100 - 0.5 × 10 = 95 mm
z_j	=	$0.8 \times \Psi_f \times h_s / 2 = 0.8 \times 1 \times 95 \;/\; 2 = 38 \; mm$
$C_3 Z_j$	=	$1.0 \times 38 = 38$

Therefore, $M_{cr} = 1.0 \times 64{,}421 \left[\sqrt{0.386 + 89{,}714 + (5 - 38)^2} - (5 - 38) \right] = 21.5 \; kN{\cdot}m$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	13.7	13.7	none	
Critical moment, M_{cr} (kN·m)	21.5	21.5	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Belgian NA - Tee Section.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The Belgian NA is specified using `NA 8`
- Simply-supported span: `CMN 1.0`
- Varying end moments and a uniformly distributed load: `CMM 7`

- The values of `C1 1.0`, `C2 1.0`, and `C3 1.0` are specified

> **Note:** Since these parameters are specified, `MU` is *not* specified as it would be ignored in favor of the direct coefficient specifications. Refer to D5.D.10.2 Clause 6.3.2.2 –Elastic critical moment and imperfection factors for LTB checks (on page 1564) for additional details.

V. EC3 Belgian NA - Varying End Moments

Calculate the bending capacity of a beam using an I section subject to a concentrated load and varying end moments per the Belgian NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 10 kN/m uniform load. The left support has a -10.0 kN·m moment applied and the right support has a 8.0 kN·m moment applied.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	*2.578*
C_2	=	*1.554*
k_w	=	$k = 1$
$\frac{\pi^2 E I_y}{(kL)^2}$	=	*7,477,200*
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	*22,394*
$\frac{(kL)^2 G I_t}{\pi^2 E I_y}$	=	*23,737*
$C_2 Z_g$	=	$1.554 \times 160 = 248.6$

Therefore, $M_{cr} = 1{,}541\ kN \cdot m$

$$\mu = \frac{FL}{4M} = \frac{4 \times 5}{4 \times 10} = 0.5 > 0$$

From the graph, $C_1 = 1.184$, $C_2 = 0.17$

$$C_2 z_g = 0.17 \times 160 = 27.2$$

Therefore, $M_{cr} = 1{,}676\ kN \cdot m$

Results

Table 643:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	1,676	1,676.1	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Belgian NA - Varying End Moments-CMM8.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The Belgian NA is specified using `NA 8`
- Simply-supported span: `CMN 1.0`
- Concentrated load with varying end moments: `CMM 8`
- The parameter `MU 0.5` is used for the case with varying end moments
- The value of `C2 0.17` is specified; based on calculation of μ

V. EC3 French NA - Channel Section with Conc Load

Calculate the bending capacity of a channel section beam under subject to a pair of concentrated load per the French NA to EC3

Details

The section is a C15X50, grade S275 steel. The member is a 6 m span, simply supported beam is subject to two concentrated loads of 10 kN each at the 1/3 points (2 m from either support).

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{1{,}123(10)^3 275}{1.0(10)^6} = 308.7 \text{ kN}\cdot\text{m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(k_z L)^2} \left[\sqrt{\left(\frac{k_z}{k_w}\right)^2 \frac{I_w}{I_z} + \frac{(k_z L)^2 G I_T}{\pi^2 E I_z} + (C_2 Z_g - C_3 Z_j)^2} - (C_2 Z_g - C_3 Z_j) \right]$$

where

C_1	=	*1.046*
C_2	=	*0.42*
C_3	=	*1.0*
$\frac{\pi^2 E I_y}{(kL)^2}$	=	*257,320*
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	*28,852*

$\frac{(kL)^2 GI_T}{\pi^2 EI_y}$ = $330{,}055$

C_2Z_g = $0.42 \times 0.5 \times 381 = 80.01$

β_f = $\frac{b_c^3 + t_c}{b_c^3 + t_c + b_t^3 + t_t} = 0.5$ (From SN030a-EN-EU)

Z_j = $0.4 \times h_s\,(2 \times \beta_f - 1) = 0$, since $\beta_f \geq 0.5$

C_3Z_j = $1.0\,(0) = 0$

Therefore, $M_{cr} = 1.046 \times 257{,}320 \left[\sqrt{28{,}852 + 330{,}055 + (80.01)^2} - (80.01)\right] = 141.2\ kN \cdot m$

Results

Table 644:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	308.7	308.7	none	
Critical moment, M_{cr} (kN·m)	141.2	142.2	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 French NA - Channel Section with Conc Load.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The French NA is specified using `NA 4`
- Simply-supported span: `CMN 1` and `C3 1`
- Concentrated loads at 1/3 points supports: `CMM 5`
- The value of `C2 0.42` is specified

V. EC3 French NA - Column with Axial Load

Calculate the axial and bending capacities and interaction ratios of a column using the French NA to EC3.

Details

The 5 m tall column as a fixed base and is free to translate and rotate at the top. The column is subject to a 25 kN compressive load and moments of 5 kN·m about the X axis and 10 kN·m about the Z axis. The section is an HD320X127, grade S275 steel.

Validation

Bending Capacity

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149(10)^3 275}{1.0(10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 GI_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	2.578
C_2	=	1.554
$\frac{\pi^2 EI_y}{(kL)^2}$	=	$7,477,200$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$22,394$
$\frac{(kL)^2 GI_t}{\pi^2 EI_y}$	=	$23,740$
$C_2 Z_g$	=	$1.554 \times 160 = 248.6$

Therefore, $M_{cr} = 1,540.6\ kN \cdot m$

From the French NA, $\lambda_{LT,\ 0} = 0.2 + 0.1 \times b\ /\ h = 0.2 + 0.1 \times 300\ /\ 327 = 0.292, \beta = 1.0$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2,149 \times 10^3 \times 275}{1,540.6 \times 10^6}} = 0.619$

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.5 of Eurocode 3,
$\alpha_{LT} = 0.4 - 0.2 \frac{b}{h} \lambda_{LT}{}^2 = 0.4 - 0.2 \frac{300}{327} (0.619)^2 = 0.323$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - \lambda_{LT,\ 0}) + \beta \times \lambda_{LT}{}^2] = 0.5[1 + 0.323 \times (0.619 - 0.292) + 0.75 \times 0.619^2] = 0.746$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}{}^2 - \beta \lambda_{LT}{}^2}\right)^{-1} = 0.861$

So, $kc = 0.9$ and thus modification factor, $f = 1 - 0.5(1 - 0.9) \times [1 - 2(0.619 - 0.8)^2] = 0.953$

$$\chi_{LT,\text{mod}} = \chi_{LT}\ /\ f = 0.903 < 1/\lambda_{LT}{}^2 = 2.603$$

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.903 \times 2,149(10)^3 \times 275}{1.0} = 533.8.\ \text{kN} \cdot \text{m}$$

Compression Capacity

Critical compressive values:

$$N_{\text{cry}} = \sqrt{\frac{\pi^2 EI_y}{(kl)^2}} = 7,477\ \text{kN}$$

$$N_{\text{crz}} = \sqrt{\frac{\pi^2 EI_z}{(kl)^2}} = 24,943\ \text{kN}$$

$$\lambda_{\text{cy}} = \sqrt{\frac{A \times f_y}{\text{N}_{\text{cry}}}} = 0.770$$

$$\lambda_{\text{cz}} = \sqrt{\frac{A \times f_y}{\text{N}_{\text{crz}}}} = 0.422$$

Determine χ_y

$h/b = 1.067 < 1.2$ and $t_f = 20.5\ mm < 100\ mm$

So, for y-y axis, use curve "c". Hence, $\alpha = 0.49$ [Table 6.2, EC3]

So, $\phi = 0.5[1+\alpha (\lambda - 0.2) +\lambda^2)] = 0.936$

$$\chi_y = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}}\ 0.681 \quad \text{(governs)}$$

Determine χ_z

$h/b = 1.067 < 1.2$ and $t_f = 20.5\ mm < 100\ mm$

So, for z-z axis, use curve "b". Hence, $\alpha = 0.34$ [Table 6.2, EC3]

So, $\phi = 0.5[1+\alpha (\lambda - 0.2) +\lambda^2)] = 0.627$

$$\chi_z = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}}\ 0.917 \quad \text{(does not govern)}$$

Compression capacity:

$$\chi_y \times N_{Rk} = 0.681 \times 7{,}477 = 3{,}020.2\ \text{kN}$$

Compression ratio: $25\ kN\ /\ 3{,}020.2\ kN = 0.008$

<u>Critical Axial Loads for Flexure and Flexural Torsional Buckling</u>

From NCCI document SN001a-EN-FU:

$$N_{cr,T} = \frac{1}{i_0^2}\left(GI_t + \frac{\pi^2 EI_w}{l_T^2}\right)$$

where

$$i_o^2 = i_y^2 + i_z^2 + y_o^2 + z_o^2; \text{ here } y_0 = z_0 = 0$$

$i_y = 75.68\ mm$ and $i_z = 138.23\ mm$

$$= 24{,}835\ \text{mm}^2$$

$$N_{cr,T} = \frac{1}{24{,}835}\left[\frac{20{,}500 \times 225.1(10)^4}{2.6} + \frac{\pi^2(205{,}000)2.069(10)^{12}}{5{,}000^2}\right] = 13{,}889\ \text{kN}$$

$$N_{cr,TF} = \frac{i_0^2}{2\left(i_y^2 + i_z^2\right)}\left[N_{cr,y} + N_{cr,T} - \sqrt{(N_{cr,y} + N_{cr,T})^2 - 4N_{cr,y}N_{cr,T}\frac{i_y^2 + i_z^2}{i_0^2}}\right]$$

$$= \frac{1}{2}\left[24{,}943 + 13{,}889 - \sqrt{(24{,}943 + 13{,}889)^2 - 4(24{,}943)(13{,}889)^1/_1}\right] = 13{,}889\ \text{kN}$$

<u>Interaction Check</u>

From Annex A, Table A.1 of EC3, we get the auxiliary terms:

$$\mu_z = \frac{1 - \frac{N_{Ed}}{N_{crz}}}{1 - \chi_z \frac{N_{Ed}}{N_{crz}}} = 1.000$$

$$\mu_y = \frac{1 - \frac{N_{Ed}}{N_{cry}}}{1 - x_y \frac{N_{Ed}}{N_{cry}}} = 0.999$$

$$\mathrm{w_z = w_{plz} / w_{elz}} = 1.116$$

$$\mathrm{w_y = w_{ply} / w_{ely}} = 1.525 > 1.5$$

The beam has uniform loading and fixed end supports and $\psi=1.0$.

$$C_{mz,0} = 0.79 + 0.21 \times 1 + 0.36\left(1 - 0.33\right)\frac{25}{24,\ 943} = 1.000 > 1 - \frac{N_{Ed}}{N_{cr,z}}$$

$$C_{my,0} = 0.79 + 0.21 \times 1 + 0.36\left(1 - 0.33\right)\frac{25}{4,\ 477} = 1.001 > 1 - \frac{N_{Ed}}{N_{cr,y}}$$

Determine λ_0: $C_1 = 1,\ C_2 = 0,\ M_{cr} = 1{,}606\ kN \cdot m$

$$\lambda_0 = \sqrt{\frac{2,\ 149 \times 10^3 \times 275}{1,\ 606 \times 10^6}} = 0.607$$

$$\lambda_{0,\min} = 0.2\sqrt{C_1}\sqrt[4]{\left(1 - \frac{N_{Ed}}{N_{cr,y}}\right) \times \left(1 - \frac{N_{Ed}}{N_{cr\mathrm{TF}}}\right)} = 0.321$$

$$a_{LT} = 1 - I_t / I_z = 0.993$$

$$\varepsilon_z = \frac{M_{z,Ed}}{N_{Ed}} \times \frac{A}{w_{elz}} = 3.350$$

$$C_{mz} = C_{mz,0} + (1 - C_{mz,0})\frac{\sqrt{\varepsilon_z a_{LT}}}{1 + \varepsilon_z a_{LT}} = 1.000$$

$$\mathrm{C_{my} = C_{my,0}} = 1.001$$

$$C_{mLT} = C_{mz}^2 \frac{a_{LT}}{\sqrt{\left(1 - \frac{N_{Ed}}{N_{cr,y}}\right) \times \left(1 - \frac{N_{Ed}}{N_{crT}}\right)}} = 0.995 < 1$$

So, $C_{mLT} = 1.0, \lambda_{max} = max.(\lambda_z,\lambda_y) = \lambda_y = 0.770$

$$b_{LT} = 0.5 a_{LT} \lambda_0^2 \frac{M_{yEd}}{x_{LT} \times M_{ply.Rd}} \times \frac{M_{zEd}}{M_{plz.Rd}} = 0.5 \times 0.993 \times 0.607^2 \frac{5}{0.909 \times 258.3} \times \frac{10}{591} \approx 0$$

$$\eta_{pl} = \frac{N_{Ed}}{N_{Rk} / \Gamma_{M1}} = \frac{25}{4,\ 436} = 0.006$$

$$C_{zz} = 1 + (w_z - 1)\left[\left(2 - \frac{1.6}{w_z} C_{mz}^2 \lambda_{\max} - \frac{1.6}{w_z} C_{mz}^2 \lambda_{\max}^2\right)\eta_{pl} - b_{LT}\right]$$

$$= 1 + (1.116 - 1)\left[\left(2 - \frac{1.6}{1.116} \times 1^2 \times 0.770 - \frac{1.6}{1.116} \times 1^2 \times 0.770^2\right)0.006 - 0\right] = 1.000$$

$$c_{LT} = 10 a_{LT} \frac{\lambda_0^2}{5 + \lambda_y^4} \times \frac{M_{z,Ed}}{C_{mz} x_{LT} M_{plz,Rd}} = 0.013$$

$$C_{zy} = 1 + (w_y - 1)\left[\left(2 - 14\frac{C_{my}{}^2 \lambda_{max}{}^2}{w_y{}^5}\right)\eta_{pl} - c_{LT}\right] = 0.996$$

$$C_{zy} > 0.6\sqrt{\frac{w_y}{w_z}} \times \frac{w_{ely}}{w_{ply}} = 0.456$$

$$d_{LT} = 2a_{LT}\frac{\lambda_0}{0.1 + \lambda_y{}^4} \times \frac{M_{z,Ed}}{C_{mz} \times \chi_{LT} \times M_{plz,Rd}} \times \frac{M_{y,Ed}}{C_{my} \times M_{ply,Rd}}$$

$$= 2 \times 0.993\frac{0.607}{0.1 + 0.770^4}\frac{10}{1 \times 0.903 \times 591}\frac{5}{1.000 \times 258.3} = 0.001$$

$$C_{yz} = 1 + (w_z - 1)\left[\left(2 - 14\frac{C_{mz}{}^2 \lambda_{max}{}^2}{w_z{}^5}\right)\eta_{pl} - d_{LT}\right] = 0.998$$

$$e_{LT} = 1.7a_{LT}\frac{\lambda_0}{0.1 + \lambda_y{}^4} \times \frac{M_{z,Ed}}{C_{mz} \times \chi_{LT} \times M_{plz,Rd}} = 1.7 \times 0.993\frac{0.607}{0.1 + 0.770^4}\frac{10}{1 \times 0.903 \times 591} = 0.043$$

$$C_{yy} = 1 + (w_y - 1)\left[\left(2 - \frac{1.6}{w_y}C_{my}{}^2\lambda_{max} - \frac{1.6}{w_y}C_{my}{}^2\lambda_{max}{}^2\right)\eta_{pl} - e_{LT}\right]$$

$$= 1 + (1.5 - 1)\left[\left(2 - \frac{1.6}{1.5} \times 1.001^2 \times 0.770 - \frac{1.6}{1.5} \times 1.001^2 \times 0.770^2\right)0.006 - 0.043\right] = 0.980$$

$W_{ely}/W_{ply} = 0.656 < C_{yy}$. So, $C_{yy} = 0.980$

Interaction factors:

$$K_{zz} = C_{mz}C_{mLT}\frac{\mu_z}{1 - \frac{N_{Ed}}{N_{crz}}}\frac{1}{C_{zz}} = 1.001$$

$$K_{zy} = C_{my}\frac{\mu_z}{1 - \frac{N_{Ed}}{N_{cry}}}\frac{1}{C_{zy}}0.6\sqrt{\frac{w_y}{w_z}} = 0.701$$

$$K_{yz} = C_{mz}C_{mLT}\frac{\mu_y}{1 - \frac{N_{Ed}}{N_{crz}}}\frac{1}{C_{yz}}0.6\sqrt{\frac{w_z}{w_y}} = 0.518$$

$$K_{yy} = C_{my}\frac{\mu_y}{1 - \frac{N_{Ed}}{N_{cry}}}\frac{1}{C_{yy}} = 1.023$$

Check for Clause 6.3.3-661:

$$\frac{N_{Ed}}{x_Z\frac{N_{Rk}}{\gamma M_1}} + K_{ZZ}\frac{M_{z,Ed}}{x_{LT}\frac{M_{z,Rk}}{\gamma M_1}} + K_{zy}\frac{M_{y,Ed}}{\frac{M_{y,Rk}}{\gamma M_1}} = \frac{25}{0.9174 \times 4{,}436} + 1.001\frac{10}{0.903 \times 591} + 0.701\frac{5}{258.3} = 0.038$$

Check for Clause 6.3.3-662:

$$\frac{N_{Ed}}{x_y \frac{N_{Rk}}{\gamma M_1}} + K_{yz}\frac{M_{z,Ed}}{x_{LT}\frac{M_{z,Rk}}{\gamma M_1}} + K_{yy}\frac{M_{y,Ed}}{\frac{M_{y,Rk}}{\gamma M_1}} = \frac{25}{0.6809 \times 4{,}436} + 0.518\frac{10}{0.903 \times 591} + 1.023\frac{5}{258.3} = 0.038$$

Results

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 French NA - Column with Axial Load.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The French NA is specified using `NA 4`
- Fixed support: `CMM 2.0`

- Fixed base and free at other end: `CMN 0.7`
- The value of `C2 1.554` is specified
- Program calculated kc per Table 6.6 of EN 1993-1-1:2005: `KC 0`

V. EC3 French NA - I Section with Conc Load

Calculate the bending capacity of a beam subject to a concentrated load per the French NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 30 kN concentrated load at midpsan.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	1.35
C_2	=	0.59
$\frac{\pi^2 E I_y}{(kL)^2}$	=	7,477,200
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	22,394
$\frac{(kL)^2 G I_t}{\pi^2 E I_y}$	=	23,737
$C_2 Z_g$	=	0.59×160 = 94.4

Therefore, $M_{cr} = 1{,}416\ kN·m$

From the French NA, $\lambda_{LT,0} = 0.2 + 0.1 \times b / h = 0.2 + 0.1 \times 300 / 327 = 0.292, \beta = 1.0$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times (10)^3 \times 275}{1{,}416 \times (10)^6}} = 0.646$

H/b = 320/300 = 1.067 < 2

$\alpha_{LT} = 0.4 - 0.2 \times b / h \times \lambda_{LT}^2 = 0.4 - 0.2 \times 300 / 327 \times 0.646^2 = 0.324$

From Cl. 6.3.2.3 of Eurocode3:

$\Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - \lambda_{LT,0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.324 \times (0.646 - 0.292) + 1 \times 0.646^2] = 0.766$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta\lambda_{LT}^2}\right)^{-1} = 0.849$

$$M_B = \frac{\chi_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.849 \times 2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 501.9 \text{ kN·m}$$

Results

Table 646:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	1,416	1,416	none	
Bending capacity, M_B (kN·m)	501.9	502.6	negligible

V. EC3 French NA - I Section with UDL

Calculate the bending capacity of a beam using an I section subject to a uniformly distributed load per the French NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 GI_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	2.578
C_2	=	1.554
$\frac{\pi^2 EI_y}{(kL)^2}$	=	7,477,200
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	22,394
$\frac{(kL)^2 GI_t}{\pi^2 EI_y}$	=	23,737
$C_2 Z_g$	=	$1.554 \times 160 = 248.6$

Therefore, $M_{cr} = 1{,}539\ kN·m$

From the French NA, $\lambda_{LT,0} = 0.2 + 0.1 \times b / h = 0.2 + 0.1 \times 300 / 327 = 0.292, \beta = 1.0$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times (10)^3 \times 275}{1{,}539 \times (10)^6}} = 0.620$

$H/b = 320/300 = 1.067 < 2$

$\alpha_{LT} = 0.4 - 0.2 \times b / h \times \lambda_{LT}^2 = 0.4 - 0.2 \times 300 / 327 \times 0.620^2 = 0.330$

From Cl. 6.3.2.3 of Eurocode3:

$\Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - \lambda_{LT,0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.330 \times (0.620 - 0.292) + 1 \times 0.620^2] = 0.746$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta\lambda_{LT}^2}\right)^{-1} = 0.861$

$k_c = 0.9$

Modification factor: $f = 1 - 0.5(1 - k_c)\left[1 - 2(\lambda_{LT} - 0.8)^2\right] = 1 - 0.5(1 - 0.9)\left[1 - 2(0.620 - 0.8)^2\right] = 0.953$

$\chi_{LT,mod} = \frac{\chi_{LT}}{f} = 0.903 < \frac{1}{\lambda_{LT}^2} = 2.603$, OK

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.903 \times 2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 533.8 \text{ kN·m}$$

Results

Table 647: Comparison of results for EC3 French NA - I Section with UDL

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	1,539	1,539.7	negligible	
Bending capacity, M_B (kN·m)	533.8	534.6	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 French NA - I Section with UDL.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The French NA is specified using `NA 4`
- Uniformly distributed load w/ fixed-fixed supports: `CMM 2`
- The value of `C2 1.554` is specified
- The parameter KC specifies a value of 0.9 for k_c
- The yield strength is directly specified by `PY 275000`.

V. EC3 French NA - Tee Section

Calculate the bending capacity of a beam using an Tee section subject to a uniformly distributed load and varying end moments per the French NA to EC3.

Details

The section is an Indian INST100 with $f_y = 300\ MPa$. The member is a 5 m, simply-supported span under a 2 kN/m uniform load. The left support has a -5.0 kN·m moment applied and the right support has a 2.5 kN·m moment applied.

Validation

Moment capacity:

$$M_{\mathrm{ckd}} = \frac{W_{\mathrm{ply}} f_y}{\gamma_{M0}} = \frac{45.5 \times (10)^3 \times 300}{1.0 \times (10)^6} = 13.7\ \mathrm{kN \cdot m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(k_z L)^2} \left[\sqrt{\left(\frac{k_z}{k_w}\right)^2 \frac{I_w}{I_z} + \frac{(k_z L)^2 G I_T}{\pi^2 E I_z} + (C_2 Z_g - C_3 Z_j)^2} - (C_2 Z_g - C_3 Z_j) \right]$$

where

C_1	=	1.0
C_2	=	1.0
C_3	=	1.0
$\frac{\pi^2 E I_y}{(kL)^2}$	=	$64{,}421$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$\left(\frac{1}{1}\right)^2 \frac{30.76}{79.6} = 0.386$
$\frac{(kL)^2 G I_T}{\pi^2 E I_y}$	=	$\frac{(1 \times 5{,}000)^2 \times 205{,}000 \times 7.33 \times (10)^4}{2.6 \times \pi^2 \times 205{,}000 \times 79.6 \times (10)^4} = 89{,}714$

C_2Z_g	=	$1.0 \times 10\ /\ 2 = 5$
Ψ_f	=	1 ($I_{ft} = 0$, as there is no tension flange present in the Tee section)
h_s	=	D - 0.5×t_f = 100 - 0.5 × 10 = 95 mm
z_j	=	$0.8 \times \Psi_f \times h_s / 2 = 0.8 \times 1 \times 95\ /\ 2 = 38\ mm$
C_3Z_j	=	$1.0 \times 38 = 38$

Therefore, $M_{cr} = 1.0 \times 64{,}421 \left[\sqrt{0.386 + 89{,}714 + (5 - 38)^2} - (5 - 38) \right] = 21.5\ kN \cdot m$

Results

Table 648:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	13.7	13.7	none	
Critical moment, M_{cr} (kN·m)	21.5	21.5	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 French NA - Tee Section.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The French NA is specified using `NA 4`
- Simply-supported span: `CMN 1.0`
- Varying end moments and a uniformly distributed load: `CMM 7`
- The values of `C1 1.0`, `C2 1.0`, and `C3 1.0` are specified

> **Note:** Since these parameters are specified, `MU` is *not* specified as it would be ignored in favor of the direct coefficient specifications. Refer to D5.D.10.2 Clause 6.3.2.2 –Elastic critical moment and imperfection factors for LTB checks (on page 1564) for additional details.

V. EC3 French NA - Varying End Mom CMM8

Calculate the bending capacity of a beam using an I section subject to a concentrated load and varying end moments per the French NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 10 kN/m uniform load. The left support has a -10.0 kN·m moment applied and the right support has a 8.0 kN·m moment applied.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN}\cdot\text{m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 GI_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

k_w	=	$k = 1$
$\frac{\pi^2 EI_y}{(kL)^2}$	=	7,477,200
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	22,394
$\frac{(kL)^2 GI_t}{\pi^2 EI_y}$	=	23,737
$C_2 Z_g$	=	$0.17 \times 160 = 27.2$

$$\mu = \frac{FL}{4M} = \frac{4 \times 5}{4 \times 10} = 0.5 > 0$$

From the graph, $C_1 = 1.184$, $C_2 = 0.17$

$$C_2 z_g = 0.17 \times 160 = 27.2$$

Therefore, $M_{cr} = 1{,}676\ kN \cdot m$

Results

Table 649:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	1,676	1,676.5	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 French NA - Varying End Mom CMM8.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The French NA is specified using `NA 4`
- Simply-supported span: `CMN 1.0`
- Concentrated load with varying end moments: `CMM 8`
- The parameter `MU 0.5` is used for the case with varying end moments
- The value of `C2 0.17` is specified; based on calculation of μ

V. EC3 German NA - Built up Section with UDL

Calculate the bending capacity of a beam using a built-up I section subject to a uniformly distributed load per the German NA to EC3.

Details

The section built up from 300 mm × 20.5 mm flange plates and a 279 mm × 11.5 mm web. Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.

Validation

Section Properties

Moment of inertia about major axis,

$$I_z = 2\left[\frac{30 \times (2.05)^3}{12} + 30(2.05)\left(\frac{27.9 + 2.05}{2}\right)^2\right] + \frac{1.15(27.9)^3}{12} = 29{,}707 \text{ cm}^4$$

Moment of inertia about minor axis,

$$I_z = 2\left[\frac{2.05 \times (30)^3}{12}\right] + \frac{27.9(1.15)^3}{12} = 9{,}229 \text{ cm}^4$$

Elastic section modulus about major axis, $Z_z = \frac{29{,}707}{32/2} = 1{,}857\ cm^3$

Elastic section modulus about minor axis, $Z_y = \frac{9{,}229}{30/2} = 615.2\ cm^3$

Plastic section modulus about major axis,

$$W_{ply} = \frac{30(32)^2}{4} - \frac{(30 - 1.15)(27.9)^2}{4} = 2{,}066 \text{ cm}^3$$

Torsional constant,

$$J = 2\left[\frac{30(2.05)^3}{3}\right] + \frac{27.9(1.15)^3}{3} = 186.4 \text{ cm}^4$$

Warping constant,

$$I_w = \frac{(32 - 2.05)^2(30)^3 2.05}{24} = 2{,}068{,}700 \text{ cm}^6$$

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}066 \times (10)^3 \times 275}{1.0 \times (10)^6} = 568.1 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2}\left\{\sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 GI_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g\right\}$$

where

C_1	=	0.712
C_2	=	0.652
k	=	0.5
$\frac{\pi^2 EI_y}{(kL)^2}$	=	29,909,000
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	5,599
$\frac{(kL)^2 GI_t}{\pi^2 EI_y}$	=	5,934
$C_2 Z_g$	=	0.652×160 = 104.3

Therefore, $M_{cr} = 966.7\ kN·m$

From the German NA, $\lambda_{LT,0} = 0.4, \beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}066 \times (10)^3 \times 275}{966.7 \times (10)^6}} = 0.767$

$H/b = 320/300 = 1.067 < 2$. So, use buckling curve "c". From Table 6.5 of Eurocode 3, $\alpha_{LT} = 0.49$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1+\alpha_{LT}(\lambda_{LT} - \lambda_{LT,0}) + \beta\times \lambda_{LT}^2] = 0.5[1 + 0.49\times(0.767 - 0.2) + 1 \times 0.767^2] = 0.810$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta\lambda_{LT}^2}\right)^{-1} = 0.785$

Calculate k_c: $k_c = \sqrt{\frac{1}{C_1}} = \sqrt{1/0.712} = 1.185 > 1.0$; use the value from Table 6.6 of EC3: $k_c = 0.9$.

Modification factor: $f = 1 - 0.5(1 - k_c)\left[1 - 2(\lambda_{LT} - 0.8)^2\right] = 1 - 0.5(1 - 0.9)\left[1 - 2(0.767 - 0.8)^2\right] = 0.950$

$\chi_{LT,mod} = \frac{\chi_{LT}}{f} = 0.883 < \frac{1}{\lambda_{LT}^2} = 1.702$, OK

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.826 \times 2{,}066(10)^3 \times 275}{1.1} = 426.5 \text{ kN·m}$$

Results

Table 650: Comparison of results for EC3 German NA - I Section with UDL

Result Type	Reference	STAAD.Pro	Difference	Comments

Critical moment, M_{cr} (kN·m)	966.7	967.3	negligible	
Bending capacity, M_B (kN·m)	426.5	426.5	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 German NA - Built up Section with UDL.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The German NA is specified using `NA 10`
- Fully fixed span: `CMN 0.5`
- Uniformly distributed load w/ fixed-fixed supports: `CMM 2`
- The value of `C2 0.652` is specified
- The parameter `SBLT 1` indicates a built-up section
- The parameter `KC 0` instructs the program to calculate the value of k_c

- The parameter `PY 275000` indicates an f_y of 275 MPa

V. EC3 German NA - I Section with Conc Load

Calculate the bending capacity of a beam subject to a concentrated load per the German NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 30 kN concentrated load at midpsan.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN}\cdot\text{m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 GI_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	1.348
C_2	=	0.63
$\frac{\pi^2 EI_y}{(kL)^2}$	=	$7{,}477{,}200$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$22{,}394$
$\frac{(kL)^2 GI_t}{\pi^2 EI_y}$	=	$23{,}737$
$C_2 Z_g$	=	$0.63 \times 160 = 100.8$

Therefore, $M_{cr} = 1{,}375\ kN\cdot m$

From the German NA, $\lambda_{LT,0} = 0.4, \beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times (10)^3 \times 275}{1{,}375 \times (10)^6}} = 0.656$

$H/b = 320/300 = 1.067 < 2$

So from Table 6.5 of Eurocode 3: $\alpha_{LT} = 0.34$

From Cl. 6.3.2.3 of Eurocode3:

$\Phi_{LT} = 0.5[1+\alpha_{LT}(\lambda_{LT} - \lambda_{LT,0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34\times(0.656 - 0.4) + 0.75 \times 0.656^2] = 0.705$

$kc = 1$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta\lambda_{LT}^2}\right)^{-1} = 0.891$

Modification factor: $f = 1 - 0.5(1 - 1) \times [1 - 2(0.656 - 0.8)^2] = 1.0$

$$\chi_{LT,mod} = \frac{\chi_{LT}}{f} = 0.891 < \frac{1}{\lambda_{LT}{}^2} = 2.897, \text{OK}$$

$$M_B = \frac{x_{\mathrm{LT}} w_y f_y}{\gamma_{\mathrm{M1}}} = \frac{0.891 \times 2{,}149 \times (10)^3 \times 275}{1.1 \times (10)^6} = 478.9 \text{ kN·m}$$

Results

Table 651:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	1,375	1,376	negligible	
Bending capacity, M_B (kN·m)	478.9	478.9	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 German NA - I Section with Conc Load.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The German NA is specified using `NA 10`
- Simply-supported span: `CMN 1`
- Simply-supported span with concentrated load at midspan: `CMM 3`
- User-supplied value of kc: `KC 0`

V. EC3 German NA - Column with Axial Load

Calculate the axial and bending capacities and interaction ratios of a column using the German NA to EC3.

Details

The 5 m tall column as a fixed base and is free to translate and rotate at the top. The column is subject to a 25 kN compressive load and moments of 5 kN·m about the X axis and 10 kN·m about the Z axis. The section is an HD320X127, grade S275 steel.

Validation

Bending Capacity

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149(10)^3 275}{1.0(10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	2.578
C_2	=	1.554

$\dfrac{\pi^2 E I_y}{(kL)^2}$	=	7,477,200
$\left(\dfrac{k}{k_w}\right)^2 \dfrac{I_w}{I_y}$	=	22,394
$\dfrac{(kL)^2 G I_t}{\pi^2 E I_y}$	=	23,740
$C_2 Z_g$	=	$1.554 \times 160 = 248.6$

Therefore, $M_{cr} = 1{,}540.6\ kN \cdot m$

From the German NA, $\lambda_{LT,\ 0} = 0.4$, $\beta = 0.75$

So, $\lambda_{LT} = \sqrt{\dfrac{w_y f_y}{M_{cr}}} = \sqrt{\dfrac{2{,}149 \times 10^3 \times 275}{1{,}540.6 \times 10^6}} = 0.619$

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.5 of Eurocode 3, $\alpha_{LT} = 0.34$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1+\alpha_{LT}(\lambda_{LT} - \lambda_{LT,\ 0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.619 - 0.4) + 0.75 \times 0.619^2] = 0.681$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta\lambda_{LT}^2}\right)^{-1} = 0.908$

$kc = {}^{1}\big/_{\sqrt{C_1}} = {}^{1}\big/_{\sqrt{2.578}} = 0.623$ and thus modification factor, $f = 1 - 0.5(1 - 0.623) \times [1 - 2(0.619 - 0.8)^2] = 0.824$

$$\chi_{LT,\text{mod}} = \chi_{LT} / f = 0.824 = 1.102 > 1$$

So, $\chi_{LT,mod} = 1.0$

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{1.0 \times 2{,}149(10)^3 \times 275}{1.1} = 537.3 \text{ kN} \cdot \text{m}$$

<u>Compression Capacity</u>

Critical compressive values:

$$N_{\text{cry}} = \sqrt{\frac{\pi^2 E I_y}{(kl)^2}} = 7{,}477 \text{ kN}$$

$$N_{\text{crz}} = \sqrt{\frac{\pi^2 E I_z}{(kl)^2}} = 24{,}943 \text{ kN}$$

$N_{c,Rd} = A_g f_y\ /\ \gamma_{M0} = 16{,}130 \times 275\ /\ 1.0\ (10)^{-3} = 4{,}436\ kN$ for a Class 1 section.

Check the flexural buckling resistance per Cl. 6.3.1.1.

$N_{b,Rd} = \chi \times A \times f_y\ /\ \gamma_{M1}$ for a Class 1 section.

Buckling curves for I section are found in Table 6.2. Imperfection factor, α, values are found in Table 6.1.

Along Z

$$h/b = 1.067 < 2$$

$$t_f = 20.5 < 100$$

So, for the z-z axis, use curve “b”. Hence, *a = 0.34* (*EC3 Table 6.2*).

$$\lambda_{cz} = \sqrt{\frac{A \times f_y}{N_{crz}}} = \frac{L_{cr}}{i_z \times \lambda_1}$$

where

L_{cr}	=	5,000 mm
i_z	=	138.2 mm
λ_1	=	$93.9\varepsilon = 93.9\sqrt{\frac{235}{f_y}} = 93.9\sqrt{\frac{235}{275}} = 86.80$

Thus, $\lambda_{cz} = \frac{5,000}{138.2 \times 86.80} = 0.417$

$$\phi = 0.5[1+\alpha(\lambda_z - 0.2) + \lambda^2)] = 0.624$$

$$\chi_z = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}} = 0.919$$

Compression capacity about Z:

$$N_{b,Rd} = \chi_z \times A \times f_y / \gamma_{M1} = 0.919 \times 16,130 \times 275 / 1.1 = 3,707.5 \text{ kN}$$

Along Y

For the y-y axis, use curve “c”. Hence, *a = 0.49* (*EC3 Table 6.2*).

$$\lambda_{cz} = \sqrt{\frac{A \times f_y}{N_{crz}}} = \frac{L_{cr}}{i_z \times \lambda_1}$$

where

L_{cr}	=	5,000 mm
i_y	=	75.68 mm
λ_1	=	$93.9\varepsilon = 93.9\sqrt{\frac{235}{f_y}} = 93.9\sqrt{\frac{235}{275}} = 86.80$

Thus, $\lambda_{cy} = \frac{5,000}{75.68 \times 86.80} = 0.761$

$$\phi = 0.5[1+\alpha(\lambda_z - 0.2) + \lambda^2)] = 0.827$$

$$\chi_y = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}} = 0.687$$

Compression capacity about Z:

$$N_{b,Rd} = \chi_z \times A \times f_y / \gamma_{M1} = 0.687 \times 16,130 \times 275 / 1.1 = 2,768.6 \text{ kN}$$

Thus, the compression capacity, $N_{b,Rd} = 2,768.6\ kN$

Compression ratio: $25\ kN\ /\ 2,768.6\ kN = 0.009$

Critical Axial Loads for Flexure and Flexural Torsional Buckling

From NCCI document SN001a-EN-FU:

$$N_{cr,T} = \frac{1}{i_0^2}\left(GI_t + \frac{\pi^2 EI_w}{l_T^2}\right)$$

where

i_o^2	=	$i_y^2 + i_z^2 + y_o^2 + z_o^2$; here $y_0 = z_0 = 0$

$i_y = 75.68\ mm$ and $i_z = 138.23\ mm$

$$= 24{,}835\ \text{mm}^2$$

$$N_{cr,T} = \frac{1}{24{,}835}\left[\frac{20{,}500 \times 225.1(10)^4}{2.6} + \frac{\pi^2(205{,}000)2.069(10)^{12}}{5{,}000^2}\right] = 13{,}889\ \text{kN}$$

$$N_{cr,TF} = \frac{i_0^2}{2\left(i_y^2 + i_z^2\right)}\left[N_{cr,y} + N_{cr,T} - \sqrt{\left(N_{cr,y} + N_{cr,T}\right)^2 - 4N_{cr,y}N_{cr,T}\frac{i_y^2 + i_z^2}{i_0^2}}\right]$$

$$= \frac{1}{2}\left[24{,}943 + 13{,}889 - \sqrt{(24{,}943 + 13{,}889)^2 - 4(24{,}943)(13{,}889)^1/_1}\right] = 13{,}889\ \text{kN}$$

<u>Interaction Check</u>

From Annex B, Table B.3 of EN 1993:1-1:2005,

$W_z = W_{plz} / W_{elz} = 2{,}149 / 1{,}926 = 1.116$

$W_y = W_{ply} / W_{ely} = 939 / 615.9 = 1.525 > 1.5;\ W_y = 1.5$

$\psi = 1.0$

So, $C_{mz} = 0.6 + 0.4\psi = 1.0$

$C_{mLT} = C_{mz} = 1.0$

$C_{my} = 0.6 + 0.4\psi = 1.0$

Interaction factors:

$$K_{zz} = C_{mz}\left[1 + (\lambda_z - 0.2)\frac{N_{Ed}}{x_z \times N_{Rk} \times \gamma_{M1}}\right] = 1\left[1 + (0.422 - 0.2)\frac{25}{0.917 \times 4,\ 436}\right] = 1.001$$

$$K_{yy} = C_{my}\left[1 + (2\lambda_y - 0.6)\frac{N_{Ed}}{x_y \times N_{Rk} \times \gamma_{M1}}\right] = 1\left[1 + (2 \times 0.770 - 0.6)\frac{25}{0.681 \times 4,\ 436}\right] = 1.008$$

$$K_{yz1} = 0.6K_{zz} = 0.601$$

$$K_{yz2} = 1 + \frac{0.1 \times \lambda_y}{C_{mLT} - 0.25}\frac{N_{Ed}}{x_y \times N_{Rk} \times \gamma_{M1}} = 1 - \frac{0.1 \times 0.770}{(1 - 0.25)}\frac{25}{0.681 \times 4,\ 436} = 0.999$$

So, $K_{yz} = maximum(K_{yz1}, K_{yz2}) = 0.999$

$K_{zy} = 0.6 \times K_{yy} = 0.6(1.008) = 0.605$

Check for Clause 6.3.3-661:

$$\frac{N_{Ed}}{x_Z\frac{N_{Rk}}{\gamma M_1}} + K_{ZZ}\frac{M_{z,Ed}}{x_{LT}\frac{M_{z,Rk}}{\gamma M_1}} + K_{zy}\frac{M_{y,Ed}}{\frac{M_{y,Rk}}{\gamma M_1}} = \frac{25 \times 1.1}{0.9174 \times 4{,}436} + 1.001\frac{10 \times 1.1}{1.0 \times 591} + 0.605\frac{5 \times 1.1}{258.3} = 0.038$$

Check for Clause 6.3.3-662:

$$\frac{N_{Ed}}{x_y\frac{N_{Rk}}{\gamma M_1}} + K_{yz}\frac{M_{z,Ed}}{x_{LT}\frac{M_{z,Rk}}{\gamma M_1}} + K_{yy}\frac{M_{y,Ed}}{\frac{M_{y,Rk}}{\gamma M_1}} = \frac{25 \times 1.1}{0.681 \times 4{,}436} + 0.999\frac{10 \times 1.1}{1.0 \times 591} + 1.008\frac{5 \times 1.1}{258.3} = 0.049$$

Results

V. EC3 German NA - I Section with UDL

Calculate the bending capacity of a beam using an I section subject to a uniformly distributed load per the German NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 GI_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	0.712
C_2	=	0.652
k	=	0.5
$\frac{\pi^2 EI_y}{(kL)^2}$	=	$29{,}909{,}000$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$5{,}599$
$\frac{(kL)^2 GI_t}{\pi^2 EI_y}$	=	$5{,}934$
$C_2 Z_g$	=	$0.652 \times 160 = 104.3$

Therefore, $M_{cr} = 966.7\ kN·m$

From the German NA, $\lambda_{LT,\ 0} = 0.4$, $\beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times (10)^3 \times 275}{966.7 \times (10)^6}} = 0.782$

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.5 of Eurocode 3, $a_{LT} = 0.34$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - \lambda_{LT,\ 0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.782 - 0.2) + 1 \times 0.782^2] = 0.794$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \lambda_{LT}^2}\right)^{-1} = 0.827$

So, $kc = 1 / \sqrt{C_1} = 1 / \sqrt{0.712} = 1.182 > 1$ but this value cannot be used, so from Table 6.6 of the Eurocode 3, $k_c = 0.9$

Modification factor: $f = 1 - 0.5(1 - k_c)\left[1 - 2(\lambda_{LT} - 0.8)^2\right] = 1 - 0.5(1 - 0.9)\left[1 - 2(0.782 - 0.8)^2\right] = 0.950$

$\chi_{LT,mod} = \frac{\chi_{LT}}{f} = 0.871 < \frac{1}{\lambda_{LT}^2} = 1.635$, OK

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.871 \times 2{,}149(10)^3 \times 275}{1.1} = 467.7 \text{ kN·m}$$

Results

Table 653: Comparison of results for EC3 German NA - I Section with UDL

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	966.7	967.3	negligible	
Bending capacity, M_B (kN·m)	467.7	467.8	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 German NA - I Section with UDL.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The German NA is specified using `NA 10`
- Fully fixed span: `CMN 0.5`
- Uniformly distributed load w/ fixed-fixed supports: `CMM 2`
- The value of `C2 0.652` is specified
- The parameter `KC 0` instructs the program to calculate the value of k_c
- A second design parameter set is used with `MTH 1` to use Cl 6.3.2.2 to determine Φ_{LT}

> **Note:** The previously set parameters are still used as they are not specified again with a different value, which is the default behavior in STAAD.Pro batch design.

V. EC3 Malaysian NA - Channel Section with Conc Load

Calculate the bending capacity of a channel section beam under subject to a pair of concentrated load per the Malaysian NA to EC3

Details

The section is a C15X50, grade S275 steel. The member is a 6 m span, simply supported beam is subject to two concentrated loads of 10 kN each at the 1/3 points (2 m from either support).

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{1{,}123(10)^3 275}{1.0(10)^6} = 308.7 \text{ kN}\cdot\text{m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(k_z L)^2} \left[\sqrt{\left(\frac{k_z}{k_w}\right)^2 \frac{I_w}{I_z} + \frac{(k_z L)^2 G I_T}{\pi^2 E I_z} + (C_2 Z_g - C_3 Z_j)^2} - (C_2 Z_g - C_3 Z_j) \right]$$

where

C_1	=	*1.046*
C_2	=	*0.42*
C_3	=	*1.0*

$$\frac{\pi^2 EI_y}{(kL)^2} = 257{,}320$$

$$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y} = 28{,}852$$

$$\frac{(kL)^2 GI_T}{\pi^2 EI_y} = 330{,}055$$

$$C_2 Z_g = 0.42 \times 0.5 \times 381 = 80.01$$

$$\beta_f = \frac{b_c{}^3 + t_c}{b_c{}^3 + t_c +- b_t{}^3 + t_t} = 0.5 \text{ (From SN030a-EN-EU)}$$

$$Z_j = 0.4 \times h_s\,(2 \times \beta_f - 1) = 0\text{, since } \beta_f \geq 0.5$$

$$C_3 Z_j = 1.0\,(0) = 0$$

Therefore, $M_{cr} = 1.046 \times 257{,}320 \left[\sqrt{28{,}852 + 330{,}055 + (80.01)^2} - (80.01)\right] = 141.2\ kN{\cdot}m$

Results

Table 654:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	308.7	308.7	none	
Critical moment, M_{cr} (kN·m)	141.2	142.2	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Malaysian NA - Channel Section with Conc Load.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The Malaysian NA is specified using `NA 9`
- Simply-supported span: `CMN 1` and `C3 1`
- Concentrated loads at 1/3 points supports: `CMM 5`
- The value of `C2 0.42` is specified

V. EC3 Malaysian NA - I Section with Conc Load

Calculate the bending capacity of a beam subject to a concentrated load per the Malaysian NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 30 kN concentrated load at midpsan.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 GI_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	1.348
C_2	=	0.63
$\frac{\pi^2 EI_y}{(kL)^2}$	=	$7,477,200$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$22,394$
$\frac{(kL)^2 GI_t}{\pi^2 EI_y}$	=	$23,737$
$C_2 Z_g$	=	$0.63 \times 160 = 100.8$

Therefore, $M_{cr} = 1,375\ kN \cdot m$

From the Malaysian NA, $\lambda_{LT,0} = 0.4, \beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2,149 \times (10)^3 \times 275}{1,375 \times (10)^6}} = 0.656$

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.5 of Eurocode 3, $\alpha_{LT} = 0.34$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - \lambda_{LT,0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.656 - 0.4) + 1 \times 0.656^2] = 0.705$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta\lambda_{LT}^2}\right)^{-1} = 0.891$

So, $kc = 1 / \sqrt{C_1} = 1 / \sqrt{1.348} = 0.861$

Modification factor: $f = 1 - 0.5(1 - 0.861) \times [1 - 2(0.656 - 0.8)^2] = 0.934$

$\chi_{LT,mod} = \frac{\chi_{LT}}{f} = 0.955 < \frac{1}{\lambda_{LT}^2} = 2.897$, OK

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.955 \times 2,149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 564.3\ \mathrm{kN \cdot m}$$

Results

V. EC3 Malaysian NA - I Section with UDL

Calculate the bending capacity of a beam using an I section subject to a uniformly distributed load per the Malaysian NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN}\cdot\text{m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	*0.712*
C_2	=	*0.652*
k	=	*0.5*
$\frac{\pi^2 E I_y}{(kL)^2}$	=	*29,909,000*
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	*5,599*
$\frac{(kL)^2 G I_t}{\pi^2 E I_y}$	=	*5,934*
$C_2 Z_g$	=	$0.652 \times 160 = 104.3$

Therefore, $M_{cr} = 966.7\ kN\cdot m$

From the Malaysian NA, $\lambda_{LT,0} = 0.4$, $\beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times (10)^3 \times 275}{966.7 \times (10)^6}} = 0.782$

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.5 of Eurocode 3, $a_{LT} = 0.34$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1+\alpha_{LT}(\lambda_{LT} - \lambda_{LT,0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.782 - 0.2) + 1 \times 0.782^2] = 0.794$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}{}^{2} - \beta\lambda_{LT}{}^{2}}\right)^{-1} = 0.827$

So, $kc = 1 / \sqrt{C_1} = 1 / \sqrt{0.712} = 1.182 > 1$ but this value cannot be used, so from Table 6.6 of the Eurocode 3, $k_c = 0.9$

Modification factor: $f = 1 - 0.5(1 - k_c)\left[1 - 2(\lambda_{LT} - 0.8)^2\right] = 1 - 0.5(1 - 0.9)\left[1 - 2(0.782 - 0.8)^2\right] = 0.950$

$\chi_{LT,mod} = \frac{\chi_{LT}}{f} = 0.871 < \frac{1}{\lambda_{LT}{}^{2}} = 1.635$, OK

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.871 \times 2{,}149(10)^3 \times 275}{1.0} = 514.4 \text{ kN}\cdot\text{m}$$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	966.7	967.3	negligible	
Bending capacity, M_B (kN·m)	514.4	514.5	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\ Verification Models\09 Steel Design\Europe\EC3 Malaysian NA - I Section with UDL.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The Malaysian NA is specified using `NA 9`
- Fully fixed span: `CMN 0.5`
- Uniformly distributed load w/ fixed-fixed supports: `CMM 2`
- The parameter `KC 0` instructs the program to calculate the value of k_c

V. EC3 Malaysian NA - Tee Section

Calculate the bending capacity of a beam using an Tee section subject to a uniformly distributed load and varying end moments per the Malaysian NA to EC3.

Details

The section is an Indian INST100 with $f_y = 300\ MPa$. The member is a 5 m, simply-supported span under a 2 kN/m uniform load. The left support has a -5.0 kN·m moment applied and the right support has a 2.5 kN·m moment applied.

Validation

Moment capacity:

$$M_{\text{ckd}} = \frac{W_{\text{ply}} f_y}{\gamma_{M0}} = \frac{45.5 \times (10)^3 \times 300}{1.0 \times (10)^6} = 13.7\ \text{kN}\cdot\text{m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(k_z L)^2} \left[\sqrt{\left(\frac{k_z}{k_w}\right)^2 \frac{I_w}{I_z} + \frac{(k_z L)^2 G I_T}{\pi^2 E I_z} + (C_2 Z_g - C_3 Z_j)^2} - (C_2 Z_g - C_3 Z_j) \right]$$

where

C_1	=	1.0
C_2	=	1.0
C_3	=	1.0
$\frac{\pi^2 E I_y}{(kL)^2}$	=	$64{,}421$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$\left(\frac{1}{1}\right)^2 \frac{30.76}{79.6} = 0.386$
$\frac{(kL)^2 G I_T}{\pi^2 E I_y}$	=	$\frac{(1 \times 5{,}000)^2 \times 205{,}000 \times 7.33 \times (10)^4}{2.6 \times \pi^2 \times 205{,}000 \times 79.6 \times (10)^4} = 89{,}714$
$C_2 Z_g$	=	$1.0 \times 10 \;/\; 2 = 5$
Ψ_f	=	1 ($I_{ft} = 0$, as there is no tension flange present in the Tee section)
h_s	=	D - 0.5×t_f = 100 - 0.5 × 10 = 95 mm
z_j	=	$0.8 \times \Psi_f \times h_s / 2 = 0.8 \times 1 \times 95 \;/\; 2 = 38\ mm$
$C_3 Z_j$	=	$1.0 \times 38 = 38$

Therefore, $M_{cr} = 1.0 \times 64{,}421 \left[\sqrt{0.386 + 89{,}714 + (5 - 38)^2} - (5 - 38) \right] = 21.5\ kN \cdot m$

Results

Table 656:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	13.7	13.7	none	
Critical moment, M_{cr} (kN·m)	21.5	21.5	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Malaysian NA - Tee Section.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The Malaysian NA is specified using `NA 9`
- Simply-supported span: `CMN 1.0`
- Varying end moments and a uniformly distributed load: `CMM 7`
- The values of `C1 1.0`, `C2 1.0`, and `C3 1.0` are specified

V. EC3 Polish NA - Column with Axial Load

Calculate the axial and bending capacities and interaction ratios of a column using the Polish NA to EC3.

Details

The 5 m tall column as a fixed base and is free to translate and rotate at the top. The column is subject to a 25 kN compressive load and moments of 5 kN·m about the X axis and 10 kN·m about the Z axis. The section is an HD320X127, grade S275 steel.

Validation

Bending Capacity

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149(10)^3 275}{1.0(10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	2.578
C_2	=	1.554
$\frac{\pi^2 E I_y}{(kL)^2}$	=	$7{,}477{,}200$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$22{,}394$
$\frac{(kL)^2 G I_t}{\pi^2 E I_y}$	=	$23{,}740$
$C_2 Z_g$	=	$1.554 \times 160 = 248.6$

Therefore, $M_{cr} = 1{,}540.6 \text{ kN·m}$

From the Polish NA, $\lambda_{LT,0} = 0.4, \beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times 10^3 \times 275}{1{,}540.6 \times 10^6}} = 0.619$

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.5 of Eurocode 3, $\alpha_{LT} = 0.34$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1 + \alpha_{LT} (\lambda_{LT} - \lambda_{LT,0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.619 - 0.4) + 0.75 \times 0.619^2] = 0.681$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta\lambda_{LT}^2}\right)^{-1} = 0.908$

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.908 \times 2{,}149(10)^3 \times 275}{1.0} = 536.8 \text{ kN·m}$$

Compression Capacity

Critical compressive values:

$$N_{cry} = \sqrt{\frac{\pi^2 E I_y}{(kl)^2}} = 7{,}477 \text{ kN}$$

$$N_{crz} = \sqrt{\frac{\pi^2 E I_z}{(kl)^2}} = 24{,}943 \text{ kN}$$

$$\lambda_{cy} = \sqrt{\frac{A \times f_y}{N_{cry}}} = 0.770$$

$$\lambda_{cz} = \sqrt{\frac{A \times f_y}{N_{crz}}} = 0.422$$

Determine χ_y

$h/b = 1.067 < 1.2$ and $t_f = 20.5\ mm < 100\ mm$

So, for y-y axis, use curve "c". Hence, $\alpha = 0.49$ [Table 6.2, EC3]

So, $\phi = 0.5[1+\alpha\ (\lambda - 0.2) + \lambda^2)] = 0.936$

$$\chi_y = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}}\ 0.681 \text{ (governs)}$$

Determine χ_z

$h/b = 1.067 < 1.2$ and $t_f = 20.5\ mm < 100\ mm$

So, for z-z axis, use curve "b". Hence, $\alpha = 0.34$ [Table 6.2, EC3]

So, $\phi = 0.5[1+\alpha\ (\lambda - 0.2) + \lambda^2)] = 0.627$

$$\chi_z = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}}\ 0.917 \text{ (does not govern)}$$

Compression capacity:

$$\chi_y \times N_{Rk} = 0.681 \times 7{,}477 = 3{,}020.2 \text{ kN}$$

Compression ratio: $25\ kN\ /\ 3{,}020.2\ kN = 0.008$

Critical Axial Loads for Flexure and Flexural Torsional Buckling

From NCCI document SN001a-EN-FU:

$$N_{cr,T} = \frac{1}{i_0^2}\left(GI_t + \frac{\pi^2 EI_w}{l_T^2}\right)$$

where

$$i_o^2 = i_y^2 + i_z^2 + y_o^2 + z_o^2; \text{ here } y_0 = z_0 = 0$$

$i_y = 75.68\ mm$ and $i_z = 138.23\ mm$

$$= 24{,}835 \text{ mm}^2$$

$$N_{cr,T} = \frac{1}{24{,}835}\left[\frac{20{,}500 \times 225.1(10)^4}{2.6} + \frac{\pi^2(205{,}000)2.069(10)^{12}}{5{,}000^2}\right] = 13{,}889 \text{ kN}$$

$$N_{cr,TF} = \frac{i_0^2}{2\left(i_y^2 + i_z^2\right)}\left[N_{cr,y} + N_{cr,T} - \sqrt{\left(N_{cr,y} + N_{cr,T}\right)^2 - 4N_{cr,y}N_{cr,T}\frac{i_y^2 + i_z^2}{i_0^2}}\right]$$

$$= \frac{1}{2}\left[24{,}943 + 13{,}889 - \sqrt{(24{,}943 + 13{,}889)^2 - 4(24{,}943)(13{,}889)^1/_1}\right] = 13{,}889 \text{ kN}$$

Interaction Check

From Annex B, Table B.3 of EN 1993:1-1:2005,

$W_z = W_{plz} / W_{elz} = 2{,}149 / 1{,}926 = 1.116$

$W_y = W_{ply} / W_{ely} = 939 / 615.9 = 1.525 > 1.5; W_y = 1.5$

$\psi = 1.0$

So, $C_{mz} = 0.6 + 0.4\psi = 1.0$

$C_{mLT} = C_{mz} = 1.0$

$C_{my} = 0.6 + 0.4\psi = 1.0$

Interaction factors:

$$K_{zz} = C_{mz}\left[1 + \left(\lambda_z - 0.2\right)\frac{N_{Ed}}{x_z \times N_{Rk} \times \gamma_{M1}}\right] = 1\left[1 + (0.422 - 0.2)\frac{25}{0.681 \times 4,\ 436}\right] = 1.001$$

$$K_{yy} = C_{my}\left[1 + \left(2\lambda_y - 0.6\right)\frac{N_{Ed}}{x_y \times N_{Rk} \times \gamma_{M1}}\right] = 1\left[1 + (2 \times 0.770 - 0.6)\frac{25}{0.681 \times 4,\ 436}\right] = 1.008$$

$$K_{yz1} = 0.6K_{zz} = 0.601$$

$$K_{yz2} = 1 + \frac{0.1 \times \lambda_y}{C_{mLT} - 0.25}\frac{N_{Ed}}{x_y \times N_{Rk} \times \gamma_{M1}} = 1 - \frac{0.1 \times 0.770}{(1 - 0.25)}\frac{25}{0.681 \times 4,\ 436} = 0.999$$

So, $K_{yz} = maximum(K_{yz1}, K_{yz2}) = 0.999$

$K_{zy} = 0.6 \times K_{yy} = 0.6(1.008) = 0.605$

Check for Clause 6.3.3-661:

$$\frac{N_{Ed}}{x_Z\frac{N_{Rk}}{\gamma M_1}} + K_{ZZ}\frac{M_{z,Ed}}{x_{LT}\frac{M_{z,Rk}}{\gamma M_1}} + K_{zy}\frac{M_{y,Ed}}{\frac{M_{y,Rk}}{\gamma M_1}} = \frac{25}{0.9174 \times 4{,}436} + 1.001\frac{10}{1.0 \times 591} + 0.605\frac{5}{258.3} = 0.035$$

Check for Clause 6.3.3-662:

$$\frac{N_{Ed}}{x_y\frac{N_{Rk}}{\gamma M_1}} + K_{yz}\frac{M_{z,Ed}}{x_{LT}\frac{M_{z,Rk}}{\gamma M_1}} + K_{yy}\frac{M_{y,Ed}}{\frac{M_{y,Rk}}{\gamma M_1}} = \frac{25}{0.6809 \times 4{,}436} + 0.999\frac{10}{1.0 \times 591} + 1.008\frac{5}{258.3} = 0.045$$

<u>Check for PN-NA 20.2</u>

About the Z-Z axis:

$$\eta = {}^{N_{\mathrm{Ed}}}\!/\!_{N_{\mathrm{Rd}}} = \frac{25\ \mathrm{kN}}{4{,}436\ \mathrm{kN}} = 0.0056$$

$$m_z = {}^{M_{\mathrm{zEd}}}\!/\!_{M_{\mathrm{zRd}}} = \frac{10\ \mathrm{kN \cdot m}}{591\ \mathrm{kN \cdot m}} = 0.0169$$

$$m_y = {}^{M_{\mathrm{yEd}}}\!/\!_{M_{\mathrm{yRd}}} = \frac{5\ \mathrm{kN \cdot m}}{258.3\ \mathrm{kN \cdot m}} = 0.0194$$

$$\Delta_0 = 0.1 + 0.2\left({}^{W_{\mathrm{plz}}}\!/\!_{W_{\mathrm{elz}}} - 1\right) = 0.1 + 0.2(1.116 - 1) = 0.123$$

Per the Polish NA, the following must be satisfied:

$$\frac{\eta}{x_z} + \frac{C_{\mathrm{mz}} \times m_z}{x_{\mathrm{LT}}} + C_{\mathrm{my}} \times m_y \le 1 - \Delta_0$$

$$\frac{0.0056}{0.917} + \frac{1 \times 0.0169}{0.908} + 1 \times 0.0194 = 0.044 \leq 1 - 0.123 = 0.877$$

The ratio of the inequality sides is then: $0.044 \ / \ 0.877 = 0.050$

About the Y-Y axis:

$$\Delta_0 = 0.1 + 0.2\left({}^{W_{\text{ply}}}\!\big/_{W_{\text{ely}}} - 1\right) = 0.1 + 0.2(1.525 - 1) = 0.205$$

Per the Polish NA, the following must be satisfied:

$$\frac{\eta}{x_y} + \frac{C_{\text{my}} \times m_y}{x_{\text{LT}}} + C_{\text{mz}} \times m_y \leq 1 - \Delta_0$$

$$\frac{0.0056}{0.6809} + \frac{1 \times 0.0194}{0.908} + 1 \times 0.0169 = 0.046 \leq 1 - 0.20 = 0.80$$

The ratio of the inequality sides is then: $0.046 \ / \ 0.80 = 0.058$

Results

V. EC3 Polish NA - I Section with Conc Load

Calculate the bending capacity of a beam subject to a concentrated load per the Polish NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 30 kN concentrated load at midpsan.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	1.683
C_2	=	1.645
$\frac{\pi^2 E I_y}{(kL)^2}$	=	$7{,}477{,}200$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$22{,}394$

$$\frac{(kL)^2 GI_t}{\pi^2 EI_y} = 23{,}737$$

$$C_2 Z_g = 1.645 \times 160 = 263.2$$

Therefore, $M_{cr} = 962.9\ kN \cdot m$

From the Polish NA, $\lambda_{LT,0} = 0.4, \beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times (10)^3 \times 275}{962.9 \times (10)^6}} = 0.783$

$$H/b = 320/300 = 1.067 < 2$$

So from Table 6.3 of Eurocode 3, $a_{LT} = 0.21$.

From Cl. 6.3.2.2 of Eurocode3:

$$\Phi_{LT} = 0.5\left[1 + a_{LT}\left(\lambda_{LT} - 0.2\right) + \lambda_{LT}^2\right] = 0.5\left[1 + 0.21\left(0.783 - 0.2\right) + (0.783)^2\right] = 0.868$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \lambda_{LT}^2}\right)^{-1} = \frac{1}{0.868 + \sqrt{(0.868)^2 - (0.783)^2}} = 0.805$

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.805 \times 2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 475.7\ \mathrm{kN \cdot m}$$

Results

Table 658:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	962.9	963.4	negligible	
Bending capacity, M_B (kN·m)	475.7	475.8	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Polish NA - I Section with Conc Load.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The Polish NA is specified using `NA 6`
- The C_1 and C_2 values are directly specified: `C1 1.683` and `C2 1.645`
- Fixed-fixed span with concentrated load at midspan: `CMM 4`

- Use Cl. 6.3.2.2 to evaluate χ_{LT}: `MTH 1`

V. EC3 Polish NA - I Section with UDL

Calculate the bending capacity of a beam using an I section subject to a uniformly distributed load per the Polish NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 GI_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	2.578
C_2	=	1.554
$\frac{\pi^2 EI_y}{(kL)^2}$	=	7,477,200
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	22,394
$\frac{(kL)^2 GI_t}{\pi^2 EI_y}$	=	23,737
$C_2 Z_g$	=	$1.554 \times 160 = 248.6$

Therefore, $M_{cr} = 1{,}539 \ kN·m$

From the Polish NA, $\lambda_{LT,0} = 0.4, \beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times (10)^3 \times 275}{1{,}539 \times (10)^6}} = 0.620$

$H/b = 320/300 = 1.067 < 2$

So, from Table 6.5 of Eurocode 3, $a_{LT} = 0.34$ (buckling curve “b”)

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5\left[1 + a_{LT}\left(\lambda_{LT} - \lambda_{LT,0}\right) + \beta \times \lambda_{LT}^2\right] = 0.5\left[1 + 0.34\left(0.620 - 0.4\right) + 0.75 \times (0.620)^2\right] = 0.681$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta \times \lambda_{LT}^2}\right)^{-1} = \frac{1}{0.681 + \sqrt{(0.681)^2 - 0.75(0.620)^2}} = 0.908$

For the Polish NA, the value of k_c is evaluated as:

$$k_c = \sqrt{C_{\mathrm{mLT}}}$$

where

a_s	=	M_s / M_h = -10.42 / 20.83 = -0.5 for $-1 \le a_s \le 1$; per Table B.3 of Annex B of EC3.
ψ	=	1 for $0 \le \psi \le 1$
C_{mLT}	=	$0.1 - 0.8 \times a_s = 0.5 > 0.4$, thus use $C_{mLT} = 0.5$

So, $k_c = \sqrt{0.5} = 0.707$

Modification factor: $f = 1 - 0.5(1 - k_c)\left[1 - 2(\lambda_{LT} - 0.8)^2\right] = 1 - 0.5(1 - 0.707)\left[1 - 2(0.620 - 0.8)^2\right] = 0.863$

$\chi_{LT,mod} = \frac{\chi_{LT}}{f} = \frac{0.908}{0.863} = 1.05 > 1$, thus use $\chi_{LT,mod} = 1$

$$M_B = \frac{x_{\mathrm{LT}} w_y f_y}{\gamma_{\mathrm{M1}}} = \frac{1.0 \times 2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591\ \mathrm{kN \cdot m}$$

Results

Table 659: Comparison of results for EC3 French NA - I Section with UDL

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	1,539	1,541.5	negligible	
Bending capacity, M_B (kN·m)	591.0	591.0	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Polish NA - I Section with UDL.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The Polish NA is specified using `NA 6`
- Uniformly distributed load w/ fixed-fixed supports: `CMM 2`
- The value of `C2 1.554` is specified
- The yield strength is directly specified by `PY 275000`.

V. EC3 Singapore NA - Channel Section with Conc Load

Calculate the bending capacity of a channel section beam under subject to a pair of concentrated load per the Singaporean NA to EC3

Details

The section is a C15X50, grade S275 steel. The member is a 6 m span, simply supported beam is subject to two concentrated loads of 10 kN each at the 1/3 points (2 m from either support).

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{1{,}123(10)^3 275}{1.0(10)^6} = 308.7 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(k_z L)^2}\left[\sqrt{\left(\frac{k_z}{k_w}\right)^2 \frac{I_w}{I_z} + \frac{(k_z L)^2 G I_T}{\pi^2 E I_z} + (C_2 Z_g - C_3 Z_j)^2} - (C_2 Z_g - C_3 Z_j)\right]$$

where

C_1	=	1.046
C_2	=	0.42
C_3	=	1.0
$\frac{\pi^2 E I_y}{(kL)^2}$	=	$257,320$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$28,852$
$\frac{(kL)^2 G I_T}{\pi^2 E I_y}$	=	$330,055$
$C_2 Z_g$	=	$0.42 \times 0.5 \times 381 = 80.01$
β_f	=	$\frac{b_c^3 + t_c}{b_c^3 + t_c +\text{-}\ b_t^3 + t_t} = 0.5$ (From SN030a-EN-EU)
Z_j	=	$0.4 \times h_s (2 \times \beta_f - 1) = 0$, since $\beta_f \geq 0.5$
$C_3 Z_j$	=	$1.0\ (0) = 0$

Therefore, $M_{cr} = 1.046 \times 257,320\left[\sqrt{28,852 + 330,055 + (80.01)^2} - (80.01)\right] = 141.2\ kN \cdot m$

Results

Table 660:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	308.7	308.7	none	
Critical moment, M_{cr} (kN·m)	141.2	142.2	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Singapore NA - Channel Section with Conc Load.std` is typically installed with the program.

V. EC3 Singapore NA - Column with Axial Load

Calculate the axial and bending capacities and interaction ratios of a column using the Singaporean NA to EC3.

Details

The 5 m tall column as a fixed base and is free to translate and rotate at the top. The column is subject to a 25 kN compressive load and moments of 5 kN·m about the X axis and 10 kN·m about the Z axis. The section is an HD320X127, grade S275 steel.

Validation

Bending Capacity

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149(10)^3 275}{1.0(10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	2.578
C_2	=	1.554
$\frac{\pi^2 E I_y}{(kL)^2}$	=	$7{,}477{,}200$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$22{,}394$
$\frac{(kL)^2 G I_t}{\pi^2 E I_y}$	=	$23{,}740$
$C_2 Z_g$	=	$1.554 \times 160 = 248.6$

Therefore, $M_{cr} = 1{,}540.6$ $kN·m$

From the Singaporean NA, $\lambda_{LT,0} = 0.4$, $\beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times 10^3 \times 275}{1{,}540.6 \times 10^6}} = 0.619$

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.5 of Eurocode 3, $\alpha_{LT} = 0.34$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - \lambda_{LT,0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.619 - 0.4) + 0.75 \times 0.619^2] = 0.681$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta\lambda_{LT}^2}\right)^{-1} = 0.908$

So, $kc = 1 / \sqrt{C_1} = 1 / \sqrt{2.578} = 0.623$ and thus modification factor, $f = 0.824$

$\chi_{LT,mod} = \chi_{LT} / f = 1.10 > 1$, thus use $\chi_{LT} = 1$

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{1.0 \times 2{,}149(10)^3 \times 275}{1.0} = 591.0 \text{ kN·m}$$

Compression Capacity

Critical compressive values:

$$N_{cry} = \sqrt{\frac{\pi^2 E I_y}{(kl)^2}} = 7{,}477 \text{ kN}$$

$$N_{crz} = \sqrt{\frac{\pi^2 E I_z}{(kl)^2}} = 24{,}943 \text{ kN}$$

$$\lambda_{cy} = \sqrt{\frac{A \times f_y}{N_{cry}}} = 0.770$$

$$\lambda_{cz} = \sqrt{\frac{A \times f_y}{N_{crz}}} = 0.422$$

Determine χ_y

$h/b = 1.067 < 1.2$ and $t_f = 20.5\ mm < 100\ mm$

So, for y-y axis, use curve "c". Hence, $\alpha = 0.49$ [Table 6.2, EC3]

So, $\phi = 0.5[1+\alpha (\lambda - 0.2) +\lambda^2)] = 0.936$

$\chi_y = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}}\ 0.681$ (governs)

Determine χ_z

$h/b = 1.067 < 1.2$ and $t_f = 20.5\ mm < 100\ mm$

So, for z-z axis, use curve "b". Hence, $\alpha = 0.34$ [Table 6.2, EC3]

So, $\phi = 0.5[1+\alpha (\lambda - 0.2) +\lambda^2)] = 0.627$

$\chi_z = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}}\ 0.917$ (does not govern)

Compression capacity:

$$\chi_y \times N_{Rk} = 0.681 \times 7{,}477 = 3{,}020.2 \text{ kN}$$

Compression ratio: $25\ kN\ /\ 3{,}020.2\ kN = 0.008$

<u>Critical Axial Loads for Flexure and Flexural Torsional Buckling</u>

From NCCI document SN001a-EN-FU:

$$N_{cr,T} = \frac{1}{i_0^2}\left(GI_t + \frac{\pi^2 E I_w}{l_T^2}\right)$$

where

$i_o^2 = i_y^2 + i_z^2 + y_o^2 + z_o^2$; here $y_0 = z_0 = 0$

$i_y = 75.68\ mm$ and $i_z = 138.23\ mm$

$= 24{,}835 \text{ mm}^2$

$$N_{cr,T} = \frac{1}{24{,}835}\left[\frac{20{,}500 \times 225.1(10)^4}{2.6} + \frac{\pi^2(205{,}000)2.069(10)^{12}}{5{,}000^2}\right] = 13{,}889 \text{ kN}$$

$$N_{cr,TF} = \frac{i_0^2}{2\left(i_y^2 + i_z^2\right)}\left[N_{cr,y} + N_{cr,T} - \sqrt{\left(N_{cr,y} + N_{cr,T}\right)^2 - 4N_{cr,y}N_{cr,T}\frac{i_y^2 + i_z^2}{i_0^2}}\right]$$

$$= \tfrac{1}{2}\left[24{,}943 + 13{,}889 - \sqrt{(24{,}943 + 13{,}889)^2 - 4(24{,}943)(13{,}889)^1/_1}\right] = 13{,}889 \text{ kN}$$

<u>Interaction Check</u>

From Annex B, Table B.3 of EN 1993:1-1:2005,

$W_z = W_{plz} / W_{elz} = 2{,}149 / 1{,}926 = 1.116$

$W_y = W_{ply} / W_{ely} = 939 / 615.9 = 1.525 > 1.5$; $W_y = 1.5$

$\psi = 1.0$

So, $C_{mz} = 0.6 + 0.4\psi = 1.0$

$C_{mLT} = C_{mz} = 1.0$

$C_{my} = 0.6 + 0.4\psi = 1.0$

Interaction factors:

$$K_{zz} = C_{mz}\left[1 + (\lambda_z - 0.2)\frac{N_{Ed}}{x_z \times N_{Rk} \times \gamma_{M1}}\right] = 1\left[1 + (0.422 - 0.2)\frac{25}{0.681 \times 4,\ 436}\right] = 1.001$$

$$K_{yy} = C_{my}\left[1 + (2\lambda_y - 0.6)\frac{N_{Ed}}{x_y \times N_{Rk} \times \gamma_{M1}}\right] = 1\left[1 + (2 \times 0.770 - 0.6)\frac{25}{0.681 \times 4,\ 436}\right] = 1.008$$

$$K_{yz1} = 0.6K_{zz} = 0.601$$

$$K_{yz2} = 1 + \frac{0.1 \times \lambda_y}{C_{mLT} - 0.25}\frac{N_{Ed}}{x_y \times N_{Rk} \times \gamma_{M1}} = 1 - \frac{0.1 \times 0.770}{(1 - 0.25)}\frac{25}{0.681 \times 4,\ 436} = 0.999$$

So, $K_{yz} = maximum(K_{yz1}, K_{yz2}) = 0.999$

$K_{zy} = 0.6 \times K_{yy} = 0.6(1.008) = 0.605$

Check for Clause 6.3.3-661:

$$\frac{N_{Ed}}{x_Z\frac{N_{Rk}}{\gamma M_1}} + K_{ZZ}\frac{M_{z,Ed}}{x_{LT}\frac{M_{z,Rk}}{\gamma M_1}} + K_{zy}\frac{M_{y,Ed}}{\frac{M_{y,Rk}}{\gamma M_1}} = \frac{25}{0.9174 \times 4{,}436} + 1.001\frac{10}{1.0 \times 591} + 0.605\frac{5}{258.3} = 0.035$$

Check for Clause 6.3.3-662:

$$\frac{N_{Ed}}{x_y\frac{N_{Rk}}{\gamma M_1}} + K_{yz}\frac{M_{z,Ed}}{x_{LT}\frac{M_{z,Rk}}{\gamma M_1}} + K_{yy}\frac{M_{y,Ed}}{\frac{M_{y,Rk}}{\gamma M_1}} = \frac{25}{0.6809 \times 4{,}436} + 0.999\frac{10}{1.0 \times 591} + 1.008\frac{5}{258.3} = 0.045$$

Results

Table 661:

V. EC3 Singapore NA - I Section with Conc Load

Calculate the bending capacity of a beam subject to a concentrated load per the Singaporean NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 30 kN concentrated load at midpsan.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN}\cdot\text{m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	1.348
C_2	=	0.63
$\frac{\pi^2 E I_y}{(kL)^2}$	=	$7{,}477{,}200$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$22{,}394$
$\frac{(kL)^2 G I_t}{\pi^2 E I_y}$	=	$23{,}737$
$C_2 Z_g$	=	$0.63 \times 160 = 100.8$

Therefore, $M_{cr} = 1{,}375\ kN \cdot m$

From the Singaporean NA, $\lambda_{LT,0} = 0.4$, $\beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times (10)^3 \times 275}{1{,}375 \times (10)^6}} = 0.656$

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.5 of Eurocode 3, $\alpha_{LT} = 0.34$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1+\alpha_{LT} (\lambda_{LT} - \lambda_{LT,0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34 \times (0.656 - 0.4) + 1 \times 0.656^2] = 0.705$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta\lambda_{LT}^2}\right)^{-1} = 0.891$

So, $kc = 1 / \sqrt{C_1} = 1 / \sqrt{1.348} = 0.861$ but this value cannot be used, so from Table 6.6 of the Eurocode 3, $k_c = 0.9$

Modification factor: $f = 1 - 0.5\left(1 - 0.861\right) \times \left[1 - 2(0.656 - 0.8)^2\right] = 0.934$

$\chi_{LT,mod} = \frac{\chi_{LT}}{f} = 0.955 < \frac{1}{\lambda_{LT}^2} = 2.897$, OK

$$M_B = \frac{\chi_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.955 \times 2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 564.3 \text{ kN}\cdot\text{m}$$

Results

Table 662:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	1,375	1,376	negligible	
Bending capacity, M_B (kN·m)	564.3	564.3	none

V. EC3 Singapore NA - I Section with UDL

Calculate the bending capacity of a beam using an I section subject to a uniformly distributed load per the Singaporean NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, fixed-fixed span subject to a 10 kN/m uniform load.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

C_1	=	*0.712*
C_2	=	*0.652*
k	=	*0.5*
$\frac{\pi^2 E I_y}{(kL)^2}$	=	*29,909,000*
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	*5,599*

$$\frac{(kL)^2 GI_t}{\pi^2 EI_y} = 5{,}934$$

$$C_2 Z_g = 0.652 \times 160 = 104.3$$

Therefore, $M_{cr} = 966.7\ kN \cdot m$

From the Singaporean NA, $\lambda_{LT,0} = 0.4$, $\beta = 0.75$

So, $\lambda_{LT} = \sqrt{\frac{w_y f_y}{M_{cr}}} = \sqrt{\frac{2{,}149 \times (10)^3 \times 275}{966.7 \times (10)^6}} = 0.782$

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.5 of Eurocode 3, $a_{LT} = 0.34$.

From Cl. 6.3.2.3 of Eurocode3:

$$\Phi_{LT} = 0.5[1+\alpha_{LT}(\lambda_{LT} - \lambda_{LT,0}) + \beta \times \lambda_{LT}^2] = 0.5[1 + 0.34\times(0.782 - 0.2) + 1 \times 0.782^2] = 0.794$$

So, $\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \beta\lambda_{LT}^2}\right)^{-1} = 0.827$

So, $kc = 1/\sqrt{C_1} = 1/\sqrt{0.712} = 1.182 > 1$ but this value cannot be used, so from Table 6.6 of the Eurocode 3, $k_c = 0.9$

Modification factor: $f = 1 - 0.5(1 - k_c)\left[1 - 2(\lambda_{LT} - 0.8)^2\right] = 1 - 0.5(1 - 0.9)\left[1 - 2(0.782 - 0.8)^2\right] = 0.950$

$\chi_{LT,mod} = \frac{\chi_{LT}}{f} = 0.871 < \frac{1}{\lambda_{LT}^2} = 1.635$, OK

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.871 \times 2{,}149(10)^3 \times 275}{1.0} = 514.4\ \mathrm{kN \cdot m}$$

If Cl. 6.3.2.2 is used to determine χ_{LT}:

$H/b = 320/300 = 1.067 < 2$. So, from Table 6.3 of Eurocode 3, $a_{LT} = 0.21$.

$$\Phi_{LT} = 0.5[1+\alpha_{LT}(\lambda_{LT} - 0.2) + \lambda_{LT}^2] = 0.5[1+0.21\times(0.782 - 0.2) + 1\times0.782^2] = 0.867$$

(Cl. 6.3.2.2)

$$\chi_{LT} = \left(\Phi_{LT} + \sqrt{\Phi_{LT}^2 - \lambda_{LT}^2}\right)^{-1} = 0.806$$

$$M_B = \frac{x_{LT} w_y f_y}{\gamma_{M1}} = \frac{0.806 \times 2{,}149(10)^3 \times 275}{1.0 \times (10)^6} = 476.3\ \mathrm{kN \cdot m}$$

Results

Table 663: Comparison of results for EC3 Singaporean NA - I Section with UDL

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	966.7	967.3	negligible	

Result Type	Reference	STAAD.Pro	Difference	Comments
Bending capacity, M_B (kN·m)	514.4	514.5	negligible	
Bending capacity, M_B (kN·m)	476.3	476.3	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Singapore NA - I Section with UDL.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The Singaporean NA is specified using `NA 7`
- Fully fixed span: `CMN 0.5`
- Uniformly distributed load w/ fixed-fixed supports: `CMM 2`
- The parameter KC instructs the program to calculate the value of k_c
- A second design parameter set is used with `MTH 1` to use Cl 6.3.2.2 to determine Φ_{LT}

> **Note:** The previously set parameters are still used as they are not specified again with a different value, which is the default behavior in STAAD.Pro batch design.

V. EC3 Singapore NA - Tee Section

Calculate the bending capacity of a beam using an Tee section subject to a uniformly distributed load and varying end moments per the Singaporean NA to EC3.

Details

The section is an Indian INST100 with $f_y = 300\ MPa$. The member is a 5 m, simply-supported span under a 2 kN/m uniform load. The left support has a -5.0 kN·m moment applied and the right support has a 2.5 kN·m moment applied.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{45.5 \times (10)^3 \times 300}{1.0 \times (10)^6} = 13.7 \text{ kN}\cdot\text{m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(k_z L)^2}\left[\sqrt{\left(\frac{k_z}{k_w}\right)^2 \frac{I_w}{I_z} + \frac{(k_z L)^2 G I_T}{\pi^2 E I_z} + (C_2 Z_g - C_3 Z_j)^2} - (C_2 Z_g - C_3 Z_j)\right]$$

where

C_1	=	1.0
C_2	=	1.0
C_3	=	1.0
$\frac{\pi^2 E I_y}{(kL)^2}$	=	$64{,}421$
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	$\left(\frac{1}{1}\right)^2 \frac{30.76}{79.6} = 0.386$
$\frac{(kL)^2 G I_T}{\pi^2 E I_y}$	=	$\frac{(1\times 5{,}000)^2 \times 205{,}000 \times 7.33 \times (10)^4}{2.6 \times \pi^2 \times 205{,}000 \times 79.6 \times (10)^4} = 89{,}714$
$C_2 Z_g$	=	$1.0\times 10\ /\ 2 = 5$
Ψ_f	=	1 ($I_{ft} = 0$, as there is no tension flange present in the Tee section)
h_s	=	D - 0.5×t_f = 100 - 0.5 × 10 = 95 mm
z_j	=	$0.8\times\Psi_f\times h_s/2 = 0.8\times 1\times 95\ /\ 2 = 38\ mm$
$C_3 Z_j$	=	$1.0\times 38 = 38$

Therefore, $M_{cr} = 1.0\times 64{,}421\left[\sqrt{0.386 + 89{,}714 + (5 - 38)^2} - (5 - 38)\right] = 21.5\ kN\cdot m$

Results

Table 664:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	13.7	13.7	none	
Critical moment, M_{cr} (kN·m)	21.5	21.5	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Europe\EC3 Singapore NA - Tee Section.std` is typically installed with the program.

The following D5.C.6 Design Parameters (on page 1502) are used:

- The Singaporean NA is specified using `NA 7`

- Simply-supported span: `CMN 1.0`
- Varying end moments and a uniformly distributed load: `CMM 7`
- The values of `C1 1.0`, `C2 1.0`, and `C3 1.0` are specified

Note: Since these parameters are specified, `MU` is *not* specified as it would be ignored in favor of the direct coefficient specifications. Refer to D5.D.10.2 Clause 6.3.2.2 –Elastic critical moment and imperfection factors for LTB checks (on page 1564) for additional details.

V. EC3 Singapore NA - Varying End Mom CMM8

Calculate the bending capacity of a beam using an I section subject to a concentrated load and varying end moments per the Singaporean NA to EC3.

Details

The section is a HD320X127, Grade S275 steel. The member is a 5 m, simply-supported span subject to a 10 kN/m uniform load. The left support has a -10.0 kN·m moment applied and the right support has a 8.0 kN·m moment applied.

Validation

Moment capacity:

$$M_{ckd} = \frac{W_{ply} f_y}{\gamma_{M0}} = \frac{2{,}149 \times (10)^3 \times 275}{1.0 \times (10)^6} = 591.0 \text{ kN·m}$$

The critical moment is given by:

$$M_{cr} = C_1 \frac{\pi^2 EI}{(kL)^2} \left\{ \sqrt{\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I} + \frac{(kL)^2 G I_t}{\pi^2 EI} + (C_2 Z_g)^2} - C_2 Z_g \right\}$$

where

k_w	=	$k = 1$
$\frac{\pi^2 E I_y}{(kL)^2}$	=	*7,477,200*
$\left(\frac{k}{k_w}\right)^2 \frac{I_w}{I_y}$	=	*22,394*
$\frac{(kL)^2 G I_t}{\pi^2 E I_y}$	=	*23,737*
$C_2 Z_g$	=	$0.17 \times 160 = 27.2$

$$\mu = \frac{FL}{4M} = \frac{4 \times 5}{4 \times 10} = 0.5 > 0$$

From the graph, $C_1 = 1.184$, $C_2 = 0.17$

$$C_2 z_g = 0.17 \times 160 = 27.2$$

Therefore, $M_{cr} = 1{,}676\ kN \cdot m$

Results

Table 665:

Result Type	Reference	STAAD.Pro	Difference	Comments
Moment capacity, M_{ckd} (kN·m)	591.0	591.0	none	
Critical moment, M_{cr} (kN·m)	1,676	1,676.5	negligible

Details

The member is a 2.5 m long cantilever subject to a 100 kN compressive force. The section used is a ISA 150x115x16. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, a modulus of elasticity of 205×(10)^3 MPa, and a Poisson's ratio of 0.3.

Section PropertiesFrom IS: 808-1989, Table 6.1:

$A_x = 40$ cm^2

$c_z = 3.07$ cm

$c_y = 4.81$ cm

$I_x = 878$ cm^4

$I_y = 447$ cm^4

$r_u = 5.21$ cm

$r_y = 2.44$ cm

Validation

Check for axial compression about the major principal axis

The non-dimensional slenderness ratio,

$$\lambda_z = \sqrt{\frac{f_y\left(K_zL/r_z\right)^2}{\pi^2 E}} = \sqrt{\frac{250\left(1.0 \times 250/5.21\right)^2}{\pi^2 205{,}000}} 0.533$$

Per Table 10, buckling class is “c” for an angle section. Per Table 7, for buckling class “c”, $a = 0.49$

$$\phi_z = 0.5\left[1 + a\left(\lambda_z - 0.2\right) + \lambda_z^2\right] = 0.5\left[1 + 0.49\left(0.533 - 0.2\right) + (0.533)^2\right] = 0.724$$

$$\mathrm{X}_z = \left(\phi_z + \sqrt{\phi_z^2 - \lambda_z^2}\right)^{-1} = \frac{1}{0.724 + \sqrt{(0.724)^2 - (0.533)^2}} = 0.825$$

$$f_{cdz} = \frac{x_z \times f_y}{\gamma_{m0}} = \frac{0.825 \times 250(10)^6}{1.1} = 187.4 \text{ MPa} \qquad \text{(Cl. 7.1.2.1)}$$

The axial compression capacity with respect to the major principal axis is:

$$P_{dz} = A_x \times f_{cdz} = 40(10)^2 \text{ cm}^2 \times 187.4 \text{ MPa}(10)^{-3} = 749.7 \text{ MPa}$$

Check for axial compression about the minor principal axis

The non-dimensional slenderness ratio,

$$\lambda_y = \sqrt{\frac{f_y\left(K_zL/r_z\right)^2}{\pi^2 E}} = \sqrt{\frac{250\left(1.0 \times 250/2.44\right)^2}{\pi^2 205{,}000}} 1.139$$

$$\phi_y = 0.5\left[1 + a\left(\lambda_y - 0.2\right) + \lambda_y^2\right] = 0.5\left[1 + 0.49\left(1.139 - 0.2\right) + (1.139)^2\right] = 1.379$$

$$\mathrm{X}_y = \left(\phi_y + \sqrt{\phi_y^2 - \lambda_y^2}\right)^{-1} = \frac{1}{1.379 + \sqrt{(1.379)^2 - (1.139)^2}} = 0.464$$

$$f_{cdy} = \frac{x_y \times f_y}{\gamma_{m0}} = \frac{0.464 \times 250(10)^6}{1.1} = 105.4 \text{ MPa} \qquad \text{(Cl. 7.1.2.1)}$$

The axial compression capacity with respect to the minor principal axis is:

$$P_{dy} = A_x \times f_{cdy} = 40(10)^2 \text{ cm}^2 \times 105.4 \text{ MPa}(10)^{-3} = 421.8 \text{ MPa}$$

Check for axial compression against flexural torsional buckling

Since the member being design is an angle loaded through one leg, the axial compression capacity with respect to flexural torsional buckling must be checked. The end connection has two or more bolts (or is welded) and is assumed to be unrestrained (“hinged”). Therefore, from Table 12: $k_1 = 0.7$, $k_2 = 0.6$, and $k_3 = 5$.

$$\lambda_e = \sqrt{k_1 + k_2 \times \lambda_{vv}^2 + k_3 \times \lambda_\phi^2} \qquad \text{(Cl. 7.5.1.2)}$$

$$\varepsilon = \sqrt{250 / f_y} = 1$$

$$\lambda_{\phi} = \frac{(b+d)/2t}{\varepsilon\sqrt{\frac{\pi^2 \times E}{250}}} = \frac{(150+115)/(2 \times 16)}{1.0\sqrt{\frac{\pi^2 \times 205{,}000}{250}}} = 0.092$$

$$\lambda_{vv} = \frac{L \;/r_y}{\varepsilon\sqrt{\frac{\pi^2 \times E}{250}}} = \frac{250/2.44}{1.0\sqrt{\frac{\pi^2 \times 205{,}000}{250}}} = 1.139$$

So, $\lambda_e = \sqrt{0.7 + 0.6 \times 1.139^2 + 5 \times 0.092^2} = 1.233$

$$\phi = 0.5\left[1 + a\left(\lambda_e - 0.2\right) + \lambda_e{}^2\right] = 0.5\left[1 + 0.49\left(1.233 - 0.2\right) + (1.233)^2\right] = 1.513 \qquad \text{(Cl. 7.1.2.1)}$$

$$\chi = \left(\phi + \sqrt{\phi^2 - \lambda_e{}^2}\right)^{-1} = \frac{1}{1.513 + \sqrt{(1.513)^2 - (1.233)^2}} = 0.418$$

$$f_{cd} = \frac{x \times f_y}{\gamma_{m0}} = \frac{0.418 \times 250(10)^6}{1.1} = 95.06 \text{ MPa}$$

The axial compression capacity under flexural torsional buckling is:

$$P_{dft} = A_x \times f_{cd} = 40(10)^2 \text{ cm}^2 \times 95.06 \text{ MPa}(10)^{-3} = 380.2 \text{ MPa}$$

The minimum capacity governs, thus flexural torsional buckling controls. The utilization ratio is

$P / P_d = \frac{100}{380.2} = 0.263$

Results

Table 666:

Result Type	Reference	STAAD.Pro	Difference	Comments
Axial compression capacity,major axis (kN)	749.7	750.202	negligible	
Axial compression , minor axis (kN)	421.8	421.773	negligible	
Axial compression capacity, flexural torsional buckling (kN)	380.2	380.234	negligible	
Ratio for compression	0.263	0.263	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - Angle - Flexural Torsional Buckling.STD` is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1617) are used:

- The beam type is a cantilever, specified by `CAN 1`
- The member is connected by a single angle leg, so `ANG 1`
- The connection is considered "hinged" using `FXTY 0`
- Two or more bolts are assumed at the connection, thus `NBL 1`
- The beam is laterally unsupported, specified by `LAT 0`

V. IS 800 2007 LSD - Angle - Tension with Block Shear

Verify the design of a single angle subject to tension per the IS 800:2007 limit state method.

Reference

BIS. *IS 800: General Construction in Steel - Code of Practice*. 2007. Bureau of Indian Standards. New Delhi.

Related Links

- *D8.A.2 Design Process* (on page 1608)

Details

The member is a 3 m long cantilever subject to a 100 kN tensile force. The section used is a ISA 150x90x15. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, and a modulus of elasticity of $205\times(10)^3$ MPa.

Validation

Constants

$\gamma_{m0} = 1.1$
$\gamma_{m1} = 1.25$

Check for yielding of gross section per Cl. 6.2:

$$T_{dg} = A_g \times f_y / \gamma_{m0} = 770.5 \text{ kN} \quad \text{(Cl 6.2)}$$

Check for rupture of critical section per Cl 6.3:

$$\alpha = 0.8$$

The net section factor is given as 0.79.

$$A_{net} = 0.79 \times 33.9 \text{ cm}^2 = 26.8 \text{ cm}^2$$

$$T_{dn} = \alpha \times A_{net} \times f_u / \gamma_{m1} = 719.9 \text{ kN} \quad \text{(Cl 6.3)}$$

Check for block shear per Cl 6.4.1:

The minimum net area in shear along a bolt line parallel to the external force, $A_{vn} = 2{,}040\ mm^2$.
The minimum gross area in shear along a bolt line parallel to the external force, $A_{vg} = 3{,}525\ mm^2$.
The minimum net area in tension of the angel between the bolt hole and toe or end bolt line, normal to the line of force $A_{tn} = 570\ mm^2$.
The minimum gross area in tension of the angel between the bolt hole and toe or end bolt line, normal to the line of force $A_{tg} = 675\ mm^2$.

$$T_{db\_1} = \frac{A_{vg} f_y}{\sqrt{3}\gamma_{m0}} + \frac{0.9 A_{tn} f_u}{\gamma_{m1}} = 616.8 \text{ kN}$$

$$T_{db\_2} = \frac{0.9A_{vn} f_u}{\sqrt{3}\gamma_{m1}} + \frac{A_{tg} f_y}{\gamma_{m0}} = 509.6 \text{ kN}$$

Then tension capacity in block shear, $T_{db} = min(T_{db\_1}, T_{db\_2}) = 509.6\ kN$

Tension capacity, $T_d = min(T_{dg}, T_{dn}, T_{db}) = 509.6\ kN$

The critical ratio for tension is $100\ kN\ /\ 509.6\ kN = 0.196$

Results

Table 667:

Result Type	Reference	STAAD.Pro	Difference	Comments
Tension capacity, gross yielding (kN)	770.5	770.455	negligible	
Tension capacity, rupture of critical section (kN)	719.9	719.873	negligible	
Tension capacity, block shear (kN)	509.6	509.574	negligible	
Ratio for tension	0.196	0.196	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - Angle - Tension with Block Shear.STD` is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1617) are used:

- The default value of `ALPHA` is used.
- The net section factor is specified by `NSF 0.79`
- The areas considered in the block rupture calculation are specified by:

```
AVN 2040
AVG 3525
ATN 570
ATG 675
```

- The beam type is a cantilever, specified by `CAN 1`
- The beam is laterally unsupported, specified by `LAT 0`

V. IS 800 2007 LSD - Channel - with LTB

Verify the design of a channel section with lateral-torsional buckling per the IS 800:2007 limit state method.

CISC. “Torsional Section Properties of steel Shapes”. Canadian Institute of Steel Construction. 2002. Willowdale, Ont. p.7. http://dir.cisc-icca.ca/files/technical/techdocs/updates/torsionprop.pdf

Details

The member is a 3 m long cantilever subject to a 10 kN compressive force and uniform bending moments of 1 kN/m along both major and minor axes. The section used is a ISMC 200 and is unbraced against lateral-torsional buckling. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, a modulus of elasticity of $205 \times (10)^3$ MPa, and a Poisson's ratio, $\nu = 0.3$.

Section PropertiesFrom IS:808

Cross-sectional area, $A_x = 28.5\ cm^2$
Overall depth of the section, $h = 200\ mm$
Width of flange, $b_f = 75\ mm$
Thickness of flange, $t_f = 11.4\ mm$
Thickness of web, $t_w = 6.2\ mm$
Distance from heel to centroid, $c_y = 2.20\ cm$
Moment of inertia about major axis, $I_z = 1,830\ cm^4$
Moment of inertia about minor axis, $I_y = 139\ cm^4$*
Radius of gyration about major axis, $r_z = 8.02\ cm$
Elastic section modulus about minor axis, $Z_{ey} = 26.4\ cm^3$

* This value have been taken from the built-in section library STAAD.Pro of Indian sections.

Additional section properties:

Plastic section modulus about major axis, $Z_{pz} = 213\ cm^3$
Plastic section modulus about minor axis, $Z_{py} = 51.1\ cm^3$
Torsional moment of inertia, $I_x = 9.83\ cm^4$

Validation

Constants

$\gamma_{m0} = 1.1$
$\gamma_{m1} = 1.25$

Section Classification

$$\varepsilon = \sqrt{250 / f_y} = 1$$

$$b = b_f/2 = 37.5 \text{ mm}$$

$$b / t_f = 6.58 < 9.4\varepsilon = 9.4$$

$$d_w/t_w = 25.03 < 42\varepsilon = 42$$

Hence, from Table 2 of IS 800:2007, the flange is plastic but the web is non-slender (i.e., semi-compact).

Therefore, the overall classification of the section is “semi-compact”.

Hence, from Table 10 of IS 800:2007, the buckling class about both axes is “c”.

Check Slenderness Ratio

$k_y = k_z = 1$

The maximum allowable slenderness ratio is 180.

Slenderness ratio about the major axis, $k_z L / r_z = 37.41 < 180$

Radius of gyration about minor axis, $r_y = \sqrt{I_y / A_x} = \sqrt{139 / 28.5} = 2.21\ cm$

Slenderness ratio about the minor axis, $k_y L / r_y = 135.8 < 180$

So the slenderness is within the limit.

<u>Axial Tension Capacity</u>

Check for yielding of gross section:

$$T_{dg} = A_g \times f_y / \gamma_{m0} = 647.7\ \text{kN}$$

Check for rupture of critical section:

$$\alpha = 0.8$$

$$T_{dn} = \alpha \times A_{net} \times f_u / \gamma_{m1} = 766.1\ \text{kN}$$

Block shear areas are not specified and therefore not checked.

No tension in the member, so critical ratio is 0.

<u>Check Axial Compression</u>

Axial compression capacity of major axis:

The non-dimensional slenderness ratio, $\lambda_z = \sqrt{\dfrac{f_y (k_z L / r_z)^2}{\pi^2 E}} = \sqrt{\dfrac{250(1.0 \times 3{,}000 / 80.2)^2}{\pi^2 \times 205{,}000}} = 0.416$

For buckling class "c", the imperfection factor, $\alpha = 0.49$

$$\phi_z = 0.5\left[1 + \alpha(\lambda_z - 0.2) + \lambda_z^2\right] = 0.639$$

$$\chi_z = \frac{1}{\phi_z + \sqrt{\phi_z^2 - \lambda_z^2}} = \frac{1}{0.639 + \sqrt{0.639^2 - 0.416^2}} = 0.889$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdz} = min\left(\dfrac{\chi_z f_y}{\gamma_{m0}}, \dfrac{f_y}{\gamma_{m0}}\right) = 202.0\ MPa$

Therefore, axial compression capacity in the major axis: $P_{dz} = A_x f_{cdz} = 575.6\ kN$

The critical ratio for axial compression in major axis = $10 / 575.6 = 0.017$

Axial compression capacity of minor axis:

The non-dimensional slenderness ratio, $\lambda_y = \sqrt{\dfrac{f_y (k_y L / r_y)^2}{\pi^2 E}} = \sqrt{\dfrac{205(1.0 \times 3{,}000 / 22.2)^2}{\pi^2 \times 205{,}000}} = 1.502$

For buckling class "c", the imperfection factor, $\alpha = 0.49$

$$\phi_y = 0.5\left[1 + \alpha(\lambda_y - 0.2) + \lambda_y^2\right] = 1.961$$

$$\chi_y = \frac{1}{\phi_y + \sqrt{\phi_y^2 - \lambda_y^2}} = 0.311$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdy} = min\left(\dfrac{\chi_y f_y}{\gamma_{m0}}, \dfrac{f_y}{\gamma_{m0}}\right) = 70.75\ MPa$

Therefore, axial compression capacity in the minor axis: $P_{dy} = A_x f_{cdy} = 201.6\ kN$, which governs.

The critical ratio for axial compression in minor axis = $10 / 201.6 = 0.050$

Check Shear Capacity

Major Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vz} = 2 \times b_f t_f = 1{,}710\ mm^2$

So, as per Cl. 8.4.1, $V_{pz} = \frac{A_{vz} f_{yw}}{\sqrt{3}} = 246.8\ kN$

Hence, shear capacity along major axis: $V_{dz} = \frac{V_{pz}}{\gamma_{m0}} = 224.4\ kN$

Critical shear ratio along major axis: $3 / 224.5 = 0.013$

Minor Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vy} = h \times t_w = 1{,}240\ mm^2$

So, as per Cl. 8.4.1, $V_{py} = \frac{A_{vy} f_{yw}}{\sqrt{3}} = 179.0\ kN$

Hence, shear capacity along major axis: $V_{dy} = \frac{V_{py}}{\gamma_{m0}} = 162.7\ kN$

As per Cl. 8.4.2, $d_w / t_w = 25.03 < 67\varepsilon$, so resistance to shear buckling need not be checked.

Shear force along both axes = $3\ kN$.

Critical shear ratio along minor axis: $3 / 162.7 = 0.018$

Check Bending Capacity

Since the section has been classified as "semi-compact", $\beta_b = Z_{ez} / Z_{pz} = 0.859$.

Major Axis Bending

The elastic lateral-torsional buckling moment:

$$M_{cr} = \sqrt{\frac{\pi^2 E I_y}{L_{LT}^2}\left(G I_t + \frac{\pi^2 E I_w}{L_{LT}^2}\right)}$$

where

G = shear modulus, $= \frac{E}{2(1 + \nu)} = 78{,}850\ MPa$

d' = $d - t_f = 188.6\ mm$

b' = $b - t_w/2 = 71.9\ mm$

a = $\frac{1}{2 + \frac{d' t_w}{3b' t_f}} = \frac{1}{2 + \frac{18.86(0.62)}{3(7.19)(1.14)}} = 0.404$

I_w = warping constant, as taken from the CISC document "Torsional Section Properties of Stee
reference), which is taken from SSRC 1998 and Galambos 1968.

$$I_w = d'^2 b'^3 t_f\left[\frac{1 - 3(0.404)}{6} + \frac{a^2}{2}\left(1 + \frac{d' t_w}{6b' t_f}\right)\right] = (18.86)^2(7.19)^3 1.14\left[\frac{1 - 3(0.404)}{6} + \frac{(0.404)^2}{2}\right.$$

$$M_{cr} = \sqrt{\frac{\pi^2(205{,}000)(141)10^4}{(3{,}000)^2}\left[(78{,}850)(9.83)10^4 + \frac{\pi^2(205{,}000)(9{,}899)10^6}{(3{,}000)^2}\right]}(10)^{-6} = 55.83\ \mathrm{kN \cdot m}$$

$$\lambda_{LT} = \min \left| \begin{array}{l} \sqrt{\frac{\beta_b Z_{pz} f_y}{M_{cr}}} = \sqrt{\frac{0.859(213)(250)}{55.83(10)^3}} = 0.905 \\ \sqrt{\frac{1.2 Z_{cz} f_y}{M_{cr}}} = \sqrt{\frac{1.2(183)(250)}{55.83(10)^3}} = 0.992 \end{array} \right.$$

Since $\lambda_{LT} > 0.4$, per 8.2.2(c), Lateral Torsional Buckling must be considered.

$$\phi_{\mathrm{LT}} = 0.5\left[1 + 0.21(\lambda_{\mathrm{LT}} - 0.2) + \lambda_{\mathrm{LT}}^2\right] = 0.984$$

$$\chi_{\mathrm{LT}} = \frac{1}{\phi_{\mathrm{LT}} + \sqrt{\phi_{\mathrm{LT}}^2 - \lambda_{\mathrm{LT}}^2}} = 0.730$$

$$f_{bd} = \frac{\chi_{LT} f_y}{\gamma_{m0}} = 165.9 \text{ MPa}$$

So, the bending strength with respect to the major axis is $M_{dz} = \beta_b Z_{pz} f_{bd} = 30.35\ kN \cdot m$

Actual bending moment about the major axis is $M_z = 4.5\ kN \cdot m$.

The critical bending ratio in the major axis is $4.5\ /\ 30.35 = 0.148$

Minor Axis Bending

Since the section has been classified as “semi-compact”, $\beta_b = Z_{ey}\ /\ Z_{py} = 0.517$.

Actual shear force in both axes, $V = 3\ kN < 0.6V_d = 89.75\ kN$. Hence, the section is subjected to low shear.

$$\frac{\beta_b Z_{py} f_y}{\gamma_{m0}} = 5.938 \text{ kN} \cdot \text{m}$$

$$\frac{1.2 Z_{ey} f_y}{\gamma_{m0}} = 8.907 \text{ kN} \cdot \text{m}$$

So, the governing bending strength with respect to the minor axis is $M_{dy} = 5.938\ kN \cdot m$

Actual bending moment about the minor axis is $M_z = 4.5\ kN \cdot m$.

The critical bending ratio in the minor axis is $4.5\ /\ 5.938 = 0.758$

Check Combined Interaction of Axial Compression and Bending

Section strength calculation as per Cl. 9.3.1.3:

Compression strength in yielding: $N_d = \frac{A_g f_y}{\gamma_{m0}} = \frac{28.5(10)^{-1}(250)}{1.1} = 647.7\ kN$

$$\frac{N}{N_d} + \frac{M_y}{M_{\mathrm{dy}}} + \frac{M_z}{M_{\mathrm{dz}}} = \frac{10}{647.7} + 0.758 + 0.148 = 0.921$$

Overall member strength in bending and axial compression

$$\mathrm{n_y} = \mathrm{F_x} / \mathrm{P_{dy}} = 0.050$$

$$\mathrm{n_z} = \mathrm{F_x} / \mathrm{P_{dz}} = 0.017$$

$$K_y = \min \left| \begin{array}{l} 1 + (\lambda_y - 0.2) n_y = 1 + (1.51 - 0.2) \cdot 0.050 = 1.066 \\ 1 + 0.8 n_y = 1 + 0.8 \cdot 0.050 = 1.040 \end{array} \right.$$

$$K_z = \min \left| \begin{array}{l} 1 + (\lambda_z - 0.2)n_z = 1 + (0.416 - 0.2) \cdot 0.017 = 1.004 \\ 1 + 0.8n_z = 1 + 0.8 \cdot 0.017 = 1.014 \end{array} \right.$$

$$K_{LT} = \max \left| \begin{array}{l} 1 - \frac{0.1\lambda_{LT}n_y}{C_{mLT} - 0.25} = 1 - \frac{0.1 \times 0.905 \times 0.050}{0.9 - 0.25} = 0.993 \\ 1 - \frac{0.1n_y}{C_{mLT} - 0.25} = 1 - \frac{0.1 \times 0.050}{0.9 - 0.25} = 0.992 \end{array} \right.$$

$$\frac{P}{P_{dy}} + K_y \frac{C_{my}M_y}{M_{dy}} + K_{LT}\frac{M_z}{M_{dz}} = 0.906$$

$$\frac{P}{P_{dz}} + 0.6K_y \frac{C_{my}M_y}{M_{dy}} + K_z \frac{C_{mz}M_z}{M_{dz}} = 0.577$$

Results

Table 668:

Result Type	Reference	STAAD.Pro	Difference	Comments
Slenderness ratio	135.8	135.84	negligible	
Tension capacity, gross yielding (kN)	647.7	647.727	none	
Tension capacity, rupture of critical section (kN)	766.1	766.08	negligible	
Axial compression capacity about major axis (kN)	575.6	575.661	negligible	
Axial compression capacity about minor axis (kN)	201.6	201.646	negligible	
Critical ratio for axial compression	0.050	0.050	none	
Shear capacity in major axis (kN)	224.4	224.379	negligible	
Shear capacity in minor axis (kN)	162.7	162.708	negligible	
Ratio for shear in major axis	0.013	0.013	none	

Result Type	Reference	STAAD.Pro	Difference	Comments
Ratio for shear in minor axis	0.018	0.018	none	
Bending capacity about major axis (kN·m)	30.35	30.382	negligible	
Bending capacity about minor axis (kN·m)	5.938	5.938	none	
Ratio for bending about major axis	0.148	0.148	none	
Ratio for bending about minor axis	0.758	0.758	none	
Ratio per Cl. 9.3.1.3	0.921	0.921	none	
Ratio per Eq. 1 of Cl. 9.3.2.2	0.906	0.906	none	
Ratio per Eq.2 of Cl. 9.3.2.2	0.577	0.577	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - Channel - With LTB.STD` is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1617) are used:

- The default value of `ALPHA` is used.
- The value of `KX 1.0` is directly specified.
- The default value of the maximum allowable slenderness ratio, `MAIN`, of 180 is used.
- The effective length for lateral-torsional buckling is specified as `LX 3` (m).
- The beam type is a cantilever, specified by `CAN 1`
- The beam is laterally unsupported, specified by `LAT 0`
- The default values of `CMX`, `CMY`, and `CMZ` of 0.9 are used (`CMZ 0.9` is directly specified).
