V. IS 800 2007 LSD - I Section - High Shear

Verify the design of an I section beam subject to high shear per the IS 800:2007 limit state method.

Reference

BIS. *IS 800: General Construction in Steel - Code of Practice*. 2007. Bureau of Indian Standards. New Delhi.

Details

The member is a 3 m long, simply-supported beam subject to the following forces:

compression force of 100 kN at the “roller” end, and
concentrated transverse loads of 350 kN at both of the one-third points acting along the minor axis of the section

The section used is a built-up I shape with 400 mm × 20 mm flanges, a web thickness of 8 mm, and an overall depth of 550 mm. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, and a modulus of elasticity of $205\times(10)^3$ MPa. The member is laterally supported along its length.

Validation

<u>Section Properties</u>

Depth of web, $d = 550 - 2\times20 = 510\ mm$

Cross-sectional area, $A_x = 2(400 \times 20) + 510 \times 8 = 20{,}080\ mm^2 = 200.8\ cm^2$

Moment of inertia about major axis, $I_z = \frac{2b_f t_f^3}{12} + 2b_f t_f\left(\frac{h}{2} - \frac{t_f}{2}\right)^2 + \frac{t_2 d^3}{12} = 21{,}336\ cm^4$

Moment of inertia about minor axis, $I_y = \frac{2t_f b_f^3}{12} + \frac{d t_w^3}{12} = 137\ cm^4$

Radius of gyration about major axis, $r_z = \sqrt{I_z / A_x} = 247.7\ \ mm$

Radius of gyration about minor axis, $r_y = \sqrt{I_y / A_x} = 103.1\ \ mm$

Elastic section modulus about major axis, $Z_{ez} = \frac{I_z}{h / 2} = 4{,}409\ cm^3$

Elastic section modulus about minor axis, $Z_{ey} = \frac{I_z}{b_f / 2} = 1{,}067\ cm^3$

Plastic section modulus about major axis, $Z_{pz} = b_f t_f (h - t_f) + 0.25t_w(h - 2t_f)^2 = 4{,}760\ cm^3$

Plastic section modulus about minor axis, $Z_{py} = \frac{b_f^2 t_f}{2} + 0.25t_w^2(h - 2t_f) = 1{,}608\ cm^3$

Constants

$\gamma_{m0} = 1.1$
$\gamma_{m1} = 1.25$

<u>Section Classification</u>

$\varepsilon = \sqrt{250 / f_y} = 1$

$b = b_f/2 = 200$ mm

$b / t_f = 10 < 9.4\varepsilon = 9.4$ and $b / t_f = 10 > 10.5\varepsilon = 10.5$

Since the section is symmetric about both axes, the neutral axis is at mid-depth.

$d_w / t_w = 63.75 < 84\varepsilon = 84$

Hence, from Table 2 of IS 800:2007, the flange is compact and the web is plastic.

Therefore, the overall classification of the section is "compact".

$h / b_f = 1.375 > 1.2$ and $t_f = 20\ mm < 40\ mm$

Hence, from Table 10 of IS 800:2007, the buckling class about the major axis is "a" and the same about the minor axis is "b".

Check Slenderness Ratio

$k_y = k_z = 1$

The maximum allowable slenderness ratio is 180.

Slenderness ratio about the major axis, $k_z L / r_z = 12.21 < 180$

Slenderness ratio about the minor axis, $k_y L / r_y = 29.10 < 180$

So the slenderness is within the limit.

Axial Tension Capacity

Check for yielding of gross section:

$T_{dg} = A_g \times f_y / \gamma_{m0} = 4{,}564$ kN

Check for rupture of critical section:

$\alpha = 0.8$

$T_{dn} = \alpha \times A_{net} \times f_u / \gamma_{m1} = 5{,}398$ kN

Block shear areas are not specified and therefore not checked.

No tension in the member, so critical ratio is 0.

Check Axial Compression

Axial compression capacity of major axis:

The non-dimensional slenderness ratio, $\lambda_z = \sqrt{\frac{f_y (k_z L / r_z)^2}{\pi^2 E}} = 0.136$

For buckling class "a", the imperfection factor, $\alpha = 0.21$

$$\phi_z = 0.5\left[1 + \alpha(\lambda_z - 0.2) + \lambda_z^2\right] = 0.502$$

$$\chi_z = \frac{1}{\phi_z + \sqrt{\phi_z^2 - \lambda_z^2}} = 1.014$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdz} = min\left(\frac{\chi_z f_y}{\gamma_{m0}}, \frac{f_y}{\gamma_{m0}}\right) = 227.3\ MPa$

Therefore, axial compression capacity in the major axis: $P_{dz} = A_x f_{cdz} = 4{,}564\ kN$

Axial compression capacity of minor axis:

The non-dimensional slenderness ratio, $\lambda_y = \sqrt{\frac{f_y (k_y L / r_y)^2}{\pi^2 E}} = 0.324$

For buckling class "b", the imperfection factor, $\alpha = 0.34$

$$\phi_y = 0.5\left[1 + \alpha\left(\lambda_y - 0.2\right) + \lambda_y^2\right] = 0.573$$

$$\chi_y = \frac{1}{\phi_y + \sqrt{\phi_y^2 - \lambda_y^2}} = 0.955$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdy} = min\left(\frac{\chi_y f_y}{\gamma_{m0}}, \frac{f_y}{\gamma_{m0}}\right) = 217.1\ MPa$

Therefore, axial compression capacity in the minor axis: $P_{dy} = A_x f_{cdy} = 4{,}360\ kN$, which governs.

The critical ratio for axial compression = $100\ /\ 4{,}360 = 0.023$

Check Shear Capacity

Major Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vz} = 2 \times b_f t_f = 16{,}000\ mm^2$

So, as per Cl. 8.4.1, $V_{pz} = \frac{A_{vz} f_{yw}}{\sqrt{3}} = 2{,}309\ kN$

Hence, shear capacity along major axis: $V_{dz} = \frac{V_{pz}}{\gamma_{m0}} = 2{,}099\ kN$

Minor Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vy} = h \times t_w = 4{,}400\ mm^2$

So, as per Cl. 8.4.1, $V_{py} = \frac{A_{vy} f_{yw}}{\sqrt{3}} = 635.1\ kN$

Hence, shear capacity along major axis: $V_{dy} = \frac{V_{py}}{\gamma_{m0}} = 577.4\ kN$

As per Cl. 8.4.2, $d\ /\ t_w = 63.75 < 67\varepsilon$, so resistance to shear buckling need not be checked.

No shear force along major axis (i.e., ratio = 0).

Critical shear ratio along minor axis: $350\ /\ 577.4 = 0.606$

Check Bending Capacity

Since the section has been classified as “compact”, $\beta_b = 1$.

Major Axis Bending

The actual shear force along the major axis, $V = 350\ kN > 0.6V_d = 346.4\ kN$. Thus, the section is subjected to high shear.

$$M_{dz} = \min\left(\frac{\beta_b Z_{pz} f_y}{\gamma_{m0}}, \frac{1.2 Z_{ez} f_y}{\gamma_{m0}}\right) = 1{,}082\ \mathrm{kN \cdot m} \qquad \text{(Cl 8.2.1.1)}$$

Per Cl 9.2.2(a) for “compact” sections:

$$\beta = \left(2\frac{V_z}{V_d} - 1\right)^2 = 0.045$$

The plastic section modulus excluding shear area, $Z_{fdz} = Z_{pz} - \frac{t_w h^2}{4} = 4{,}155\ cm^3$

Plastic design strength of cross-section area excluding shear area, $M_{fdz} = \frac{Z_{fdz} f_y}{\gamma_{m0}} = 944.4\ kN{\cdot}m$

$$M_{dvz} = M_{dz} - \beta(M_{dz} - M_{fdz}) = 1{,}082 - 0.045\times(1{,}082 - 944.4) = 1{,}076\ kN{\cdot}m \qquad \text{(Cl. 8.2.1.3)}$$

So, the governing bending strength with respect to the major axis is $M_{dz} = M_{dvz} = 1{,}076\ kN{\cdot}m$

Actual bending moment about the major axis is $M_z = 350\ kN{\cdot}m$.

The critical bending ratio in the major axis is $350\ /\ 1{,}076 = 0.325$

Minor Axis Bending

There is no shear along the minor axis.

$$\frac{\beta_b Z_{py} f_y}{\gamma_{m0}} = 365.5\ kN{\cdot}m$$

$$\frac{1.2 Z_{ey} f_y}{\gamma_{m0}} = 290.9\ kN{\cdot}m$$

So, the governing bending strength with respect to the minor axis is $M_{dy} = 290.9\ kN{\cdot}m$

No bending moment about the minor axis in beam, so critical ratio is 0.

Check Combined Interaction of Axial Compression and Bending

Section strength calculation as per Cl. 9.3.1:

$$n = N / N_d = 0.022 < 0.2$$

Hence, from Table 17:

$$\alpha_1 = \max(5n\ ,\ 1) = 1$$

$$\alpha_2 = 2$$

$$M_{ndy} = M_{dy} = 290.9\ kN{\cdot}m \qquad \text{(Cl. 9.3.1.2(c))}$$

$$1.11{\cdot}M_{dz}{\cdot}(1 - n) = 1{,}168\ kN{\cdot}m > M_{dz}$$

$$M_{ndz} = M_{dz} = 1{,}076\ kN{\cdot}m$$

$$\left(\frac{M_y}{M_{ndy}}\right)^{\alpha_1} + \left(\frac{M_z}{M_{ndz}}\right)^{\alpha_2} = \left(\frac{0}{290.9}\right)^1 + \left(\frac{350}{1{,}076}\right)^2 = 0.106$$

Overall member strength in bending and axial compression

$$n_y = F_x / P_{dy} = 0.023$$

$$n_z = F_x / P_{dz} = 0.022$$

$$K_y = \min \left| \begin{array}{l} 1 + (\lambda_y - 0.2)n_y = 1 + (0.324 - 0.2)0.023 = 1.003 \\ 1 + 0.8n_y = 1 + 0.8\ {\cdot}0.023 = 1.018 \end{array} \right.$$

$$K_z = \min \left| \begin{array}{l} 1 + (\lambda_z - 0.2)n_z = 1 + (0.136 - 0.2)0.022 = 0.999 \\ 1 + 0.8n_z = 1 + 0.8\ {\cdot}0.022 = 1.018 \end{array} \right.$$

$$\frac{P}{P_{dz}} + 0.6K_y \frac{C_{my} M_y}{M_{dy}} + K_z \frac{C_{mz} M_z}{M_{dz}} = 0.314$$

Results

Table 669:

Result Type	Reference	STAAD.Pro	Difference	Comments
Slenderness ratio	29.1	29.10	none

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - I Section - High Shear.STD` is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1617) are used:

- The default value of `ALPHA` is used.
- The default values of `KY` and `KZ` are used.
- The default value of the maximum allowable slenderness ratio, `MAIN`, of 180 is used.
- The beam type is simply supported, specified by `CAN 2`
- The beam is laterally supported, specified by `LAT 1`
- The default values of `CMX`, `CMY`, and `CMZ` of 0.9 are used.

V. IS 800 2007 LSD - I Section - with LTB

Verify the design of an I section with lateral-torsional buckling per the IS 800:2007 limit state method.

Reference

Details

The member is a 3 m long cantilever subject to a 10 kN compressive force and uniform bending moments of 1 kN/m along both major and minor axes. The section used is a ISMB200 and is unbraced against lateral-torsional buckling. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, a modulus of elasticity of 205×(10)^3 MPa, and a Poisson's ratio, $\nu = 0.3$.

Validation

Constants

$\gamma_{m0} = 1.1$
$\gamma_{m1} = 1.25$

Section Classification

$$\varepsilon = \sqrt{250 / f_y} = 1$$

$b = b_f/2 = 50$ mm

$b / t_f = 5 < 9.4\varepsilon = 9.4$

Since the section is symmetric about both axes, the neutral axis is at mid-depth.

$d_w / t_w = 27.72 < 84\varepsilon = 84$

Hence, from Table 2 of IS 800:2007, both the flange and web are plastic.

Therefore, the overall classification of the section is "plastic".

$h / b_f = 2 > 1.2$ and $t_f = 10\ mm < 40\ mm$

Hence, from Table 10 of IS 800:2007, the buckling class about the major axis is "a" and the same about the minor axis is "b".

Check Slenderness Ratio

$k_y = k_z = 1$

The maximum allowable slenderness ratio is 180.

Slenderness ratio about the major axis, $k_z L / r_z = 36.20 < 180$

Slenderness ratio about the minor axis, $k_y L / r_y = 142.2 < 180$

So the slenderness is within the limit.

Axial Tension Capacity

Check for yielding of gross section:

$T_{dg} = A_g \times f_y / \gamma_{m0} = 700$ kN

Check for rupture of critical section:

$\alpha = 0.8$

$T_{dn} = \alpha \times A_{net} \times f_u / \gamma_{m1} = 827.9$ kN

Block shear areas are not specified and therefore not checked.

No tension in the member, so critical ratio is 0.

Check Axial Compression

Axial compression capacity of major axis:

The non-dimensional slenderness ratio, $\lambda_z = \sqrt{\frac{f_y (k_z L / r_z)^2}{\pi^2 E}} = 0.402$

For buckling class "a", the imperfection factor, $\alpha = 0.21$

$$\phi_z = 0.5\left[1 + \alpha(\lambda_z - 0.2) + \lambda_z^2\right] = 0.602$$

$$\chi_z = \frac{1}{\phi_z + \sqrt{\phi_z^2 - \lambda_z^2}} = 0.952$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdz} = min\left(\frac{\chi_z f_y}{\gamma_{m0}}, \frac{f_y}{\gamma_{m0}}\right) = 216.4\ MPa$

Therefore, axial compression capacity in the major axis: $P_{dz} = A_x f_{cdz} = 666.5\ kN$

The critical ratio for axial compression in major axis = $10 / 666.5 = 0.015$

Axial compression capacity of minor axis:

The non-dimensional slenderness ratio, $\lambda_y = \sqrt{\frac{f_y(k_y L / r_y)^2}{\pi^2 E}} = 1.581$

For buckling class "b", the imperfection factor, $\alpha = 0.34$

$$\phi_y = 0.5\left[1 + \alpha(\lambda_y - 0.2) + \lambda_y^2\right] = 1.985$$

$$\chi_y = \frac{1}{\phi_y + \sqrt{\phi_y^2 - \lambda_y^2}} = 0.314$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdy} = min\left(\frac{\chi_y f_y}{\gamma_{m0}}, \frac{f_y}{\gamma_{m0}}\right) = 71.37\ MPa$

Therefore, axial compression capacity in the minor axis: $P_{dy} = A_x f_{cdy} = 219.8\ kN$, which governs.

The critical ratio for axial compression in minor axis = $10 / 219.8 = 0.045$

Check Shear Capacity

Major Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vz} = 2 \times b_f t_f = 2{,}000\ mm^2$

So, as per Cl. 8.4.1, $V_{pz} = \frac{A_{vz} f_{yw}}{\sqrt{3}} = 288.7\ kN$

Hence, shear capacity along major axis: $V_{dz} = \frac{V_{pz}}{\gamma_{m0}} = 262.4\ kN$

Minor Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vy} = h \times t_w = 1{,}140\ mm^2$

So, as per Cl. 8.4.1, $V_{py} = \frac{A_{vy} f_{yw}}{\sqrt{3}} = 164.5\ kN$

Hence, shear capacity along major axis: $V_{dy} = \frac{V_{py}}{\gamma_{m0}} = 149.6\ kN$

As per Cl. 8.4.2, $d_w / t_w = 27.72 < 67\varepsilon$, so resistance to shear buckling need not be checked.

Shear force along both axes = $3\ kN$.

Critical shear ratio along major axis: $3 / 149.6 = 0.020$

Critical shear ratio along minor axis: $3 / 262.4 = 0.011$

Check Bending Capacity

Since the section has been classified as "plastic", $\beta_b = 1$.

Major Axis Bending

The elastic lateral-torsional buckling moment:

$$M_{cr} = \sqrt{\frac{\pi^2 E I_y}{L_{LT}^2}\left(G I_t 6 + \frac{\pi^2 E I_w}{L_{LT}^2}\right)}$$

where

G	=	shear modulus, $= \frac{E}{2(1+\nu)} = 78{,}850\ MPa$
I_t	=	torsional constant, $I_x = 10.6\ cm^4$
d'	=	$h - t_f = 190\ mm$
I_w	=	warping constant, as taken from the CISC document “Torsional Section Properties of Steel Shapes” (see reference), $= \frac{(d')^2 b_f^3 t_f}{24} = 15{,}042\ cm^6$

$M_{cr} = 60.13$ kN·m

$$\lambda_{LT} = \min \begin{cases} \sqrt{\frac{\beta_b Z_{pz} f_y}{M_{cr}}} = 0.999 \\ \sqrt{\frac{1.2 Z_{cz} f_y}{M_{cr}}} = 1.027 \end{cases}$$

$$\phi_{LT} = 0.5\left[1 + 0.21(\lambda_{LT} - 0.2) + \lambda_{LT}^2\right] = 1.803$$

$$\chi_{LT} = \frac{1}{\phi_{LT} + \sqrt{\phi_{LT}^2 - \lambda_{LT}^2}} = 0.666$$

$$f_{bd} = \frac{\chi_{LT} f_y}{\gamma_{m0}} = 151.4 \text{ MPa}$$

So, the bending strength with respect to the major axis is $M_{dz} = \beta_b Z_{pz} f_{bd} = 36.35\ kN{\cdot}m$

Actual bending moment about the major axis is $M_z = 4.5\ kN{\cdot}m$.

The critical bending ratio in the major axis is $4.5\ /\ 36.35 = 0.124$

Minor Axis Bending

Actual shear force in both axes, $V = 3\ kN < 0.6V_d = 89.75\ kN$. Hence, the section is subjected to low shear.

$$\frac{\beta_b Z_{py} f_y}{\gamma_{m0}} = 10.46 \text{ kN·m}$$

$$\frac{1.2 Z_{ey} f_y}{\gamma_{m0}} = 9.341 \text{ kN·m}$$

So, the governing bending strength with respect to the minor axis is $M_{dy} = 9.341\ kN{\cdot}m$

Actual bending moment about the minor axis is $M_z = 4.5\ kN{\cdot}m$.

The critical bending ratio in the minor axis is $4.5\ /\ 9.341 = 0.482$

<u>Check Combined Interaction of Axial Compression and Bending</u>

Section strength calculation as per Cl. 9.3.1:

$$n = N / N_d = 0.014 < 0.2$$

Hence, from Table 17:

$$\alpha_1 = \max(5n\ ,\ 1) = 1$$

$$\alpha_2 = 2$$

$$M_{ndy} = M_{dy} = 9.341 \text{ kN·m} \qquad \text{(Cl. 9.3.1.2(c))}$$

$$1.11 \cdot M_{dz} \cdot (1 - n) = 39.78 \text{ kN} \cdot \text{m} > M_{dz}$$

$$M_{ndz} = M_{dz} = 36.35 \text{ kN} \cdot \text{m}$$

$$\left(\frac{M_y}{M_{ndy}}\right)^{\alpha_1} + \left(\frac{M_z}{M_{ndz}}\right)^{\alpha_2} = \left(\frac{4.5}{9.341}\right)^1 + \left(\frac{4.5}{36.35}\right)^2 = 0.497$$

Overall member strength in bending and axial compression

$$n_y = F_x / P_{dy} = 0.045$$

$$n_z = F_x / P_{dz} = 0.015$$

$$K_y = \min \left| \begin{array}{l} 1 + (\lambda_y - 0.2)n_y = 1 + (1.581 - 0.2) \cdot 0.045 = 1.063 \\ 1 + 0.8n_y = 1 + 0.8 \cdot 0.045 = 1.036 \end{array} \right.$$

$$K_z = \min \left| \begin{array}{l} 1 + (\lambda_z - 0.2)n_z = 1 + (0.402 - 0.2) \cdot 0.015 = 1.003 \\ 1 + 0.8n_z = 1 + 0.8 \cdot 0.015 = 1.012 \end{array} \right.$$

$$K_{LT} = \max \left| \begin{array}{l} 1 - \frac{0.1\lambda_{LT} n_y}{C_{mLT} - 0.25} = 1 - \frac{0.1 \times 0.999 \times 0.045}{0.9 - 0.25} = 0.993 \\ 1 - \frac{0.1 n_y}{C_{mLT} - 0.25} = 1 - \frac{0.1 \times 0.045}{0.9 - 0.25} = 0.993 \end{array} \right.$$

$$\frac{P}{P_{dy}} + K_y \frac{C_{my} M_y}{M_{dy}} + K_{LT} \frac{M_z}{M_{dz}} = 0.618$$

$$\frac{P}{P_{dz}} + 0.6K_y \frac{C_{my} M_y}{M_{dy}} + K_z \frac{C_{mz} M_z}{M_{dz}} = 0.397$$

Results

Table 670:

Result Type	Reference	STAAD.Pro	Difference	Comments
Slenderness ratio	142.3	142.24	negligible	
Tension capacity, gross yielding (kN)	700	700	none	
Tension capacity, rupture of critical section (kN)	827.9	827.904	negligible	
Axial compression capacity about major axis (kN)	666.5	666.502	negligible	
Axial compression capacity about minor axis (kN)	219.8	219.804	negligible	

Result Type	Reference	STAAD.Pro	Difference	Comments
Critical ratio for axial compression	0.045	0.045	none	
Shear capacity in major axis (kN)	262.4	262.432	negligible	
Shear capacity in minor axis (kN)	149.6	149.586	negligible	
Ratio for shear in major axis	0.011	0.011	none	
Ratio for shear in minor axis	0.020	0.020	none	
Bending capacity about major axis (kN·m)	36.35	36.347	negligible	
Bending capacity about minor axis (kN·m)	9.341	9.341	none	
Ratio for bending about major axis	0.124	0.124	none	
Ratio for bending about minor axis	0.482	0.482	none	
Ratio per Cl. 9.3.1.1	0.497	0.497	none	
Ratio per Eq. 1 of Cl. 9.3.2.2	0.618	0.618	none	
Ratio per Eq.2 of Cl. 9.3.2.2	0.397	0.397	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - I Section - with LTB.STD` is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1617) are used:

- The default value of `ALPHA` is used.
- The default values of `KY` and `KZ` are used (`KX 1.0` is directly specified).
- The default value of the maximum allowable slenderness ratio, `MAIN`, of 180 is used.
- The effective length for lateral-torsional buckling is specified as `LX 3` (m).
- The beam type is a cantilever, specified by `CAN 1`

- The beam is laterally unsupported, specified by `LAT 0`
- The default values of `CMX`, `CMY`, and `CMZ` of 0.9 are used (`CMZ 0.9` is directly specified).

V. IS 800 2007 LSD - I Section - without LTB

Verify the design of an I section subject to axial force and biaxial bending per the IS 800:2007 limit state method.

Reference

BIS. *IS 800: General Construction in Steel - Code of Practice*. 2007. Bureau of Indian Standards. New Delhi.

Related Links

- *D8.A.2 Design Process* (on page 1608)

Details

The member is a 3 m long cantilever subject to a 10 kN compressive force and uniform bending moments of 1 kN/m along both major and minor axes. The section used is a ISMB200 and is braced to prevent lateral-torsional buckling. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, and a modulus of elasticity of 205×(10)^3 MPa.

Validation

Constants

$\gamma_{m0} = 1.1$
$\gamma_{m1} = 1.25$

Section Classification

$$\varepsilon = \sqrt{250 / f_y} = 1$$

$$b = b_f/2 = 50 \text{ mm}$$

$$b / t_f = 5 < 9.4\varepsilon = 9.4$$

Since the section is symmetric about both axes, the neutral axis is at mid-depth.

$$d_w / t_w = 27.72 < 84\varepsilon = 84$$

Hence, from Table 2 of IS 800:2007, both the flange and web are plastic.

Therefore, the overall classification of the section is "plastic".

$h / b_f = 2 > 1.2$ and $t_f = 10 \text{ mm} < 40 \text{ mm}$

Hence, from Table 10 of IS 800:2007, the buckling class about the major axis is "a" and the same about the minor axis is "b".

Check Slenderness Ratio

$k_y = k_z = 1$

The maximum allowable slenderness ratio is 180.

Slenderness ratio about the major axis, $k_z L / r_z = 36.20 < 180$

Slenderness ratio about the minor axis, $k_y L \ / \ r_y = 142.2 < 180$

So the slenderness is within the limit.

Axial Tension Capacity

Check for yielding of gross section:

$$T_{dg} = A_g \times f_y / \gamma_{m0} = 700 \text{ kN}$$

Check for rupture of critical section:

$$\alpha = 0.8$$

$$T_{dn} = \alpha \times A_{net} \times f_u / \gamma_{m1} = 827.9 \text{ kN}$$

Block shear areas are not specified and therefore not checked.

No tension in the member, so critical ratio is 0.

Check Axial Compression

Axial compression capacity of major axis:

The non-dimensional slenderness ratio, $\lambda_z = \sqrt{\dfrac{f_y (k_z L \ / r_z)^2}{\pi^2 E}} = 0.402$

For buckling class "a", the imperfection factor, $\alpha = 0.21$

$$\phi_z = 0.5\left[1 + \alpha(\lambda_z - 0.2) + \lambda_z^2\right] = 0.602$$

$$\chi_z = \frac{1}{\phi_z + \sqrt{\phi_z^2 - \lambda_z^2}} = 0.952$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdz} = min\left(\dfrac{\chi_z f_y}{\gamma_{m0}}, \dfrac{f_y}{\gamma_{m0}}\right) = 216.4 \ MPa$

Therefore, axial compression capacity in the major axis: $P_{dz} = A_x f_{cdz} = 666.5 \ kN$

The critical ratio for axial compression in major axis = $10 \ / \ 666.5 = 0.015$

Axial compression capacity of minor axis:

The non-dimensional slenderness ratio, $\lambda_y = \sqrt{\dfrac{f_y (k_y L \ / r_y)^2}{\pi^2 E}} = 1.581$

For buckling class "b", the imperfection factor, $\alpha = 0.34$

$$\phi_y = 0.5\left[1 + \alpha(\lambda_y - 0.2) + \lambda_y^2\right] = 1.985$$

$$\chi_y = \frac{1}{\phi_y + \sqrt{\phi_y^2 - \lambda_y^2}} = 0.314$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdy} = min\left(\dfrac{\chi_y f_y}{\gamma_{m0}}, \dfrac{f_y}{\gamma_{m0}}\right) = 71.37 \ MPa$

Therefore, axial compression capacity in the minor axis: $P_{dy} = A_x f_{cdy} = 219.8 \ kN$, which governs.

The critical ratio for axial compression in minor axis = $10 \ / \ 219.8 = 0.045$

Check Shear Capacity

Major Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vz} = 2 \times b_f t_f = 2{,}000\ mm^2$

So, as per Cl. 8.4.1, $V_{pz} = \frac{A_{vz} f_{yw}}{\sqrt{3}} = 288.7\ kN$

Hence, shear capacity along major axis: $V_{dz} = \frac{V_{pz}}{\gamma_{m0}} = 262.4\ kN$

Minor Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vy} = h \times t_w = 1{,}140\ mm^2$

So, as per Cl. 8.4.1, $V_{py} = \frac{A_{vy} f_{yw}}{\sqrt{3}} = 164.5\ kN$

Hence, shear capacity along major axis: $V_{dy} = \frac{V_{py}}{\gamma_{m0}} = 149.6\ kN$

As per Cl. 8.4.2, $d_w\ /\ t_w = 27.72 < 67\varepsilon$, so resistance to shear buckling need not be checked.

Shear force along both axes = $3\ kN$.

Critical shear ratio along major axis: $3\ /\ 149.6 = 0.020$

Critical shear ratio along minor axis: $3\ /\ 262.4 = 0.011$

Check Bending Capacity

Since the section has been classified as "plastic", $\beta_b = 1$.

Actual shear force in both axes, $V = 3\ kN < 0.6V_d = 89.75\ kN$. Hence, the section is subjected to low shear.

Major Axis Bending

$$\frac{\beta_b Z_{py} f_y}{\gamma_{m0}} = 54.55 \text{ kN}\cdot\text{m}$$

$$\frac{1.2 Z_{ey} f_y}{\gamma_{m0}} = 72.10 \text{ kN}\cdot\text{m}$$

So, the governing bending strength with respect to the minor axis is $M_{dy} = 54.55\ kN \cdot m$

Actual bending moment about the major axis is $M_z = 4.5\ kN \cdot m$.

The critical bending ratio in the major axis is $4.5\ /\ 54.55 = 0.083$

Minor Axis Bending

$$\frac{\beta_b Z_{py} f_y}{\gamma_{m0}} = 10.46 \text{ kN}\cdot\text{m}$$

$$\frac{1.2 Z_{ey} f_y}{\gamma_{m0}} = 9.341 \text{ kN}\cdot\text{m}$$

So, the governing bending strength with respect to the minor axis is $M_{dy} = 9.341\ kN \cdot m$

Actual bending moment about the minor axis is $M_z = 4.5\ kN \cdot m$.

The critical bending ratio in the minor axis is $4.5\ /\ 9.341 = 0.482$

Check Combined Interaction of Axial Compression and Bending

Section strength calculation as per Cl. 9.3.1:

$$n = N / N_d = 0.014 < 0.2$$

Hence, from Table 17:

$$\alpha_1 = \max(5n , 1) = 1$$

$$\alpha_2 = 2$$

$$M_{ndy} = M_{dy} = 9.341 \text{ kN·m} \quad \text{(Cl. 9.3.1.2(c))}$$

$$1.11 \cdot M_{dz} \cdot (1 - n) = 59.70 \text{ kN·m} > M_{dz}$$

$$M_{ndz} = M_{dz} = 54.55 \text{ kN·m}$$

$$\left(\frac{M_y}{M_{ndy}}\right)^{\alpha_1} + \left(\frac{M_z}{M_{ndz}}\right)^{\alpha_2} = \left(\frac{4.5}{9.341}\right)^1 + \left(\frac{4.5}{54.55}\right)^2 = 0.489$$

Overall member strength in bending and axial compression

$$n_y = F_x / P_{dy} = 0.045$$

$$n_z = F_x / P_{dz} = 0.015$$

$$K_y = \min \left| \begin{array}{l} 1 + (\lambda_y - 0.2)n_y = 1 + (1.581 - 0.2) \cdot 0.045 = 1.063 \\ 1 + 0.8n_y = 1 + 0.8 \cdot 0.045 = 1.036 \end{array} \right.$$

$$K_z = \min \left| \begin{array}{l} 1 + (\lambda_z - 0.2)n_z = 1 + (0.402 - 0.2) \cdot 0.015 = 1.003 \\ 1 + 0.8n_z = 1 + 0.8 \cdot 0.015 = 1.012 \end{array} \right.$$

$$\frac{P}{P_{dz}} + 0.6K_y \frac{C_{my} M_y}{M_{dy}} + K_z \frac{C_{mz} M_z}{M_{dz}} = 0.359$$

Results

Table 671:

Result Type	Reference	STAAD.Pro	Difference	Comments
Slenderness ratio	142.3	142.24	negligible	
Tension capacity, gross yielding (kN)	700	700	none	
Tension capacity, rupture of critical section (kN)	827.9	827.904	negligible	
Axial compression capacity about major axis (kN)	666.5	666.502	negligible	
Axial compression capacity about minor axis (kN)	219.8	219.804	negligible	

Result Type	Reference	STAAD.Pro	Difference	Comments
Critical ratio for axial compression	0.045	0.045	none	
Shear capacity in major axis (kN)	262.4	262.432	negligible	
Shear capacity in minor axis (kN)	149.6	149.586	negligible	
Ratio for shear in major axis	0.011	0.011	none	
Ratio for shear in minor axis	0.020	0.020	none	
Bending capacity about major axis (kN·m)	54.55	54.545	negligible	
Bending capacity about minor axis (kN·m)	9.341	9.341	none	
Ratio for bending about major axis	0.082	0.082	none	
Ratio for bending about minor axis	0.482	0.482	none	
Ratio per Cl. 9.3.1.1	0.489	0.489	none	
Ratio per Eq.2 of Cl. 9.3.2.2	0.359	0.359	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - I Section - without LTB.STD` is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1617) are used:

- The default value of `ALPHA` is used.
- The default values of `KY` and `KZ` are used (`KX 1.0` is directly specified).
- The default value of the maximum allowable slenderness ratio, `MAIN`, of 180 is used.
- The effective length for lateral-torsional buckling is specified as `LX 3` (m).
- The beam type is a cantilever, specified by `CAN 1`
- The beam is laterally supported, specified by `LAT 1`

- The default values of CMX, CMY, and CMZ of 0.9 are used (`CMZ 0.9` is directly specified).

V. IS 800 2007 LSD - I Section with Cover Plate

Verify the design of an I section with cover plates subject to axial force and biaxial bending per the IS 800:2007 limit state method.

Reference

- *D8.A.2 Design Process* (on page 1608)

Details

The structure consists of a 5 m long column with fixed based and a 5 m cantilever beam at the top. The resulting loads on the column to be designed are:

a 55.98 kN·m moment about the major axis
a 10 kN·m moment about the minor axis
a 23.984 kN compressive force
a 2 kN shear force along the major axis
a 1.2 kN shear force along the minor axis

The section used is an ISMB500 with a 250 mm × 10 mm top cover plate and a 200 mm × 10 mm bottom cover plate. The section is braced to prevent lateral-torsional buckling. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, and a modulus of elasticity of $205\times(10)^3$ MPa.

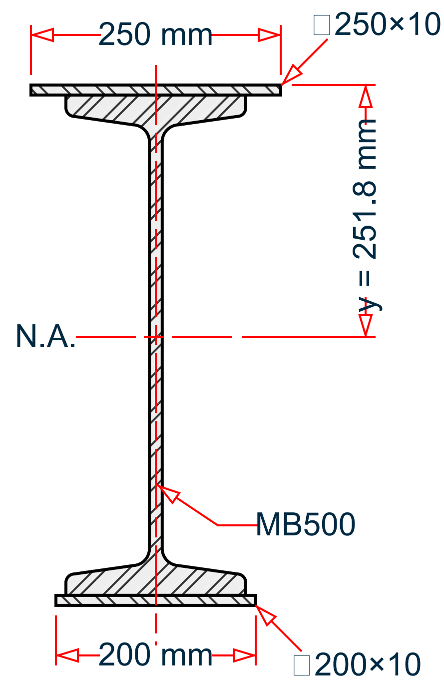

Figure 498: I section with cover plates

Validation

<u>Section Properties</u>

Overall depth of the whole section, $h = D + t_{pl1} + t_{pl2} = 500 + 10 + 10 = 520\ mm$

Depth of web of IS MB500, $d_w = D - 2 \times t_f = 500 - 2 \times 17.2 = 465.6\ mm$

Cross-section area of top cover plate, $A_{top} = 25\ cm \times 1\ cm = 25\ cm^2$

Cross-section area of bottom cover plate, $A_{bottom} = 20\ cm \times 1\ cm = 20\ cm^2$

Cross-section area, $A_x = 111\ cm^2 + 25\ cm^2 + 20\ cm^2 = 156\ cm^2$

Distance of CG from top of overall section: $y = \dfrac{A_{top}\frac{t_{pl1}}{2} + A_x'\left(t_{pl1} + \frac{D}{2}\right) + A_{bottom}\left(t_{pl1} + D + \frac{t_{pl2}}{2}\right)}{A_x} = 251.8\ mm$

Overall moment of inertia about the major axis:

$$I_z = I_z' + A_x'\left(\frac{D}{2} + t_{pl1} - y\right)^2 + \frac{b_{pl1}t_{pl1}^3}{12} + A_{top}\left(\frac{t_{pl1}}{2} - y\right)^2 + \frac{b_{pl2}t_{pl2}^3}{12} + A_{bottom}\left(t_{pl1} + D + \frac{t_{pl2}}{2} - y\right)^2$$

$$I_z = 45{,}200 \times (10)^4 + 111 \times (10)^2\left(\frac{500}{2} + 10 - 251.8\right)^2 + \frac{250 \times 10^3}{12}$$

$$+2{,}500\left(\frac{10}{2} - 251.8\right)^2 + \frac{200 \times 10^3}{12} + 2{,}000\left(10 + 500 + \frac{5}{2} - 251.8\right)^2$$

$$= 743.6(10)^6\ \mathrm{mm}^4 = 74{,}360\ \mathrm{cm}^4$$

Overall moment of inertia about the minor axis (section is symmetric about this axis):

$$I_y = I_y' + \frac{t_{p1} b_{p1}^3}{12} + \frac{t_{p2} b_{p2}^3}{12} = 1{,}370 \times (10)^4 + \frac{10 \times 250^3}{12} + \frac{10 \times 200^3}{12} = 33.39(10)^6 \text{ mm}^4 = 3{,}339 \text{ cm}^4$$

Radius of gyration about the major axis, $r_z = \sqrt{I_z / A_x} = \sqrt{74{,}360 / 156} = 21.8\ cm$

Radius of gyration about the minor axis, $r_y = \sqrt{I_y / A_x} = \sqrt{3{,}339 / 156} = 4.63\ cm$

Elastic section modulus about the major axis, $Z_{ez} = \frac{I_z}{h - y} = \frac{74{,}360}{52 - 25.18} = 2{,}773\ cm^3$

Elastic section modulus about the minor axis, $Z_{ey} = \frac{I_y}{b_{p1} / 2} = \frac{3{,}339}{25 / 2} = 267.1\ cm^3$

Distance to equal area axis from top, $c_p = \frac{(D + 2t_{p1} - t_f)t_w + b_{p2}t_{p2} - b_{p1}t_{p1}}{2t_W} = 226.9\ mm$

Plastic section modulus about the major axis,

$$Z_{pz} = b_{b1}t_{p1}\left(c_p - \frac{t_{p1}}{2}\right) + b_f t_f\left(c_p - t_{p1} - \frac{t_f}{2}\right) + t_w\frac{(c_p - t_{p1} - t_f)^2}{2} + t_w\frac{(D + t_{p1} - c_p - t_f)^2}{2}$$
$$+ b_f t_f\left(D + t_{p1} - c_p - \frac{t_f}{2}\right) + b_{b2}t_{p2}\left(D + t_{p1} + \frac{t_{p2}}{2} - c_p\right) = 3{,}190 \text{ cm}^3$$

Plastic section modulus about the minor axis, $Z_{py} = \frac{2t_f b_f^2}{4} + \frac{d_w t_w^2}{4} + \frac{t_{p1}b_{p1}^2}{4} + \frac{t_{p2}b_{p2}^2}{4} = 547\ cm^3$

Constants

$\gamma_{m0} = 1.1$
$\gamma_{m1} = 1.25$

Section Classification

$$\varepsilon = \sqrt{250 / f_y} = 1$$

Section classification of different portions of the section must be checked separately. Checking is performed per Table 2 of IS 800:2007 as indicated in the following figure:

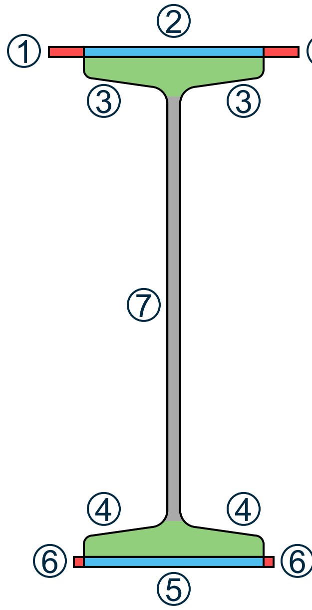

Figure 499: Different portions of the cross section to be checked for section classification

1. Outstanding element of top cover plate: $\frac{b_{p1} - b_f}{2t_{p1}} = 3.5 < 9.4\varepsilon = 9.4$ hence, plastic.
2. Internal element of top cover plate: $\frac{b_f}{t_{p1}} = 18 < 29.3\varepsilon = 29.3$ hence, plastic.
3. Internal element of top flange $\frac{b_f}{2t_f} = 5.23 < 29.3\varepsilon = 29.3$ hence, plastic.
4. Internal element of bottom flange $\frac{b_f}{2t_f} = 5.23 < 29.3\varepsilon = 29.3$ hence, plastic.
5. Internal element of bottom cover plate $\frac{b_f}{t_{p2}} = 18 < 29.3\varepsilon = 29.3$ hence, plastic.
6. Outstanding element of bottom cover plate $\frac{b_{p2} - b_f}{2t_{p2}} = 1 < 9.4\varepsilon = 9.4$ hence, plastic.
7. Web of ISMB section $\frac{d_2}{t_w} = 45.65 < 84\varepsilon = 84$ hence, plastic.

Overall classification of the section is based on the most critical class among the different classes identified above. Here, the overall section is classified as “plastic”.

Since $t_f = 17.2\ mm < 40\ mm$

Hence, from Table 10, as per the requirements of welded I section, the buckling class about major axis buckling is “b” and the same about minor axis buckling is “c”.

<u>Check Slenderness Ratio</u>

$k_y = k_z = 1$

The maximum allowable slenderness ratio is 180.

Slenderness ratio about the major axis, $k_zL\ /\ r_z = 1.0 \times 500\ /\ 21.8 = 22.9 < 180$

Slenderness ratio about the minor axis, $k_y L \ / \ r_y = 1.0 \times 500 \ / \ 4.63 = 108.0 < 180$

So the slenderness is within the limit.

Axial Tension Capacity

Check for yielding of gross section:

$$T_{dg} = A_g \times f_y / \gamma_{m0} = 3{,}545 \text{ kN}$$

Check for rupture of critical section:

$$\alpha = 0.8$$

$$T_{dn} = \alpha \times A_{net} \times f_u / \gamma_{m1} = 4{,}193 \text{ kN}$$

Block shear areas are not specified and therefore not checked.

No tension in the member, so critical ratio is 0.

Check Axial Compression

Axial compression capacity of major axis:

The non-dimensional slenderness ratio, $\lambda_z = \sqrt{\dfrac{f_y (k_z L \ / \ r_z)^2}{\pi^2 E}} = 0.255$

For buckling class “b”, the imperfection factor, $\alpha = 0.34$

$$\phi_z = 0.5\left[1 + \alpha(\lambda_z - 0.2) + \lambda_z^2\right] = 0.542$$

$$\chi_z = \frac{1}{\phi_z + \sqrt{\phi_z^2 - \lambda_z^2}} = 0.981$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdz} = min\left(\dfrac{\chi_z f_y}{\gamma_{m0}}, \ \dfrac{f_y}{\gamma_{m0}}\right) = 222.9 \ MPa$

Therefore, axial compression capacity in the major axis: $P_{dz} = A_x f_{cdz} = 3{,}477 \ kN$

Axial compression capacity of minor axis:

The non-dimensional slenderness ratio, $\lambda_y = \sqrt{\dfrac{f_y (k_y L \ / \ r_y)^2}{\pi^2 E}} = 1.201$

For buckling class “c”, the imperfection factor, $\alpha = 0.49$

$$\phi_y = 0.5\left[1 + \alpha(\lambda_y - 0.2) + \lambda_y^2\right] = 1.467$$

$$\chi_y = \frac{1}{\phi_y + \sqrt{\phi_y^2 - \lambda_y^2}} = 0.433$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdy} = min\left(\dfrac{\chi_y f_y}{\gamma_{m0}}, \ \dfrac{f_y}{\gamma_{m0}}\right) = 98.43 \ MPa$

Therefore, axial compression capacity in the minor axis: $P_{dy} = A_x f_{cdy} = 1{,}536 \ kN$, which governs.

The critical ratio for axial compression in minor axis = $23.98 \ / \ 1{,}536 = 0.007$

Check Shear Capacity

Major Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vz} = 2 \times b_f t_f + b_{p1} t_{p1} + b_{p2} t_{p2} = 10,692\ mm^2$

So, as per Cl. 8.4.1, $V_{pz} = \dfrac{A_{vz} f_{yw}}{\sqrt{3}} = 1,543\ kN$

Hence, shear capacity along major axis: $V_{dz} = \dfrac{V_{pz}}{\gamma_{m0}} = 1,403\ kN$

Minor Axis

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vy} = d_w \times t_w = 4,749\ mm^2$

So, as per Cl. 8.4.1, $V_{py} = \dfrac{A_{vy} f_{yw}}{\sqrt{3}} = 685.5\ kN$

Hence, shear capacity along major axis: $V_{dy} = \dfrac{V_{py}}{\gamma_{m0}} = 623.2\ kN$

As per Cl. 8.4.2, $d_w / t_w = 45.65 < 67\varepsilon$, so resistance to shear buckling need not be checked.

Shear force along major axis = $2\ kN$.

Critical shear ratio along major axis: $2 / 1,403 = 0.001$

Shear force along minor axis = $1.2\ kN$.

Critical shear ratio along minor axis: $1.2 / 623.2 = 0.002$

<u>Check Bending Capacity</u>

Since the section has been classified as “plastic”, $\beta_b = 1$.

The section is low shear in both axes.

Major Axis Bending

$$\frac{\beta_b Z_{py} f_y}{\gamma_{m0}} = 724.9\ \mathrm{kN \cdot m}$$

Actual bending moment about the major axis is $M_z = 55.98\ kN \cdot m$.

The critical bending ratio in the major axis is $55.98 / 724.9 = 0.077$

Minor Axis Bending

$$\frac{\beta_b Z_{py} f_y}{\gamma_{m0}} = 124.3\ \mathrm{kN \cdot m}$$

Actual bending moment about the minor axis is $M_z = 10\ kN \cdot m$.

The critical bending ratio in the minor axis is $10 / 124.3 = 0.080$

<u>Check Combined Interaction of Axial Compression and Bending</u>

Section strength calculation as per Cl. 9.3.1:

$$n = N / N_d = 0.007 < 0.2$$

Hence, from Table 17:

$$\alpha_1 = \max(5n , 1) = 1$$

$$\alpha_2 = 2$$

As per 9.3.1.2(b),

$$a = \frac{A - 2b_f t_f}{A} = 0.603$$

$$n_1 = \max(n,a) = 0.603$$

$$M_{ndy} = \min \begin{vmatrix} M_{dy} = 124.3 \text{ kN}\cdot\text{m} \\ M_{dy}\left[1 - \left(\frac{n_1 - a}{1 - a}\right)^2\right] = 124.3 \text{ kN}\cdot\text{m} \end{vmatrix}$$

$$M_{ndz} = \min \begin{vmatrix} M_{dz} = 724.9 \text{ kN}\cdot\text{m} \\ M_{dz}\left(\frac{1 - n}{1 - 0.5a}\right) = 724.2 \text{ kN}\cdot\text{m} \end{vmatrix}$$

Therefore:

$$\left(\frac{M_y}{M_{ndy}}\right)^{a_1} + \left(\frac{M_z}{M_{ndz}}\right)^{a_2} = \left(\frac{10}{124.3}\right)^1 + \left(\frac{55.98}{724.2}\right)^2 = 0.086$$

Overall member strength in bending and axial compression

$$n_y = F_x / P_{dy} = 0.016$$

$$n_z = F_x / P_{dz} = 0.007$$

$$K_y = \min \begin{vmatrix} 1 + (\lambda_y - 0.2)n_y = 1 + (1.201 - 0.2) \times 0.016 = 1.016 \\ 1 + 0.8n_y = 1 + 0.8 \times 0.016 = 1.013 \end{vmatrix}$$

$$K_z = \min \begin{vmatrix} 1 + (\lambda_z - 0.2)n_z = 1 + (0.255 - 0.2) \times 0.007 = 1.000 \\ 1 + 0.8n_z = 1 + 0.8 \times 0.007 = 1.006 \end{vmatrix}$$

$$\frac{P}{P_{dz}} + 0.6K_y\frac{C_{my}M_y}{M_{dy}} + K_z\frac{C_{mz}M_z}{M_{dz}} = 0.120$$

Results

Table 672:

Result Type	Reference	STAAD.Pro	Difference	Comments
Slenderness ratio	108.0	108.08	negligible	
Tension capacity, gross yielding (kN)	3,545	3,545	none	
Tension capacity, rupture of critical section (kN)	4,193	4,163	negligible	
Axial compression capacity about major axis (kN)	3,477	3,477	none	

Result Type	Reference	STAAD.Pro	Difference	Comments

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - I Section with Cover Plate.std` is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1617) are used:

- The default value of `ALPHA` is used.
- The default values of `KY` and `KZ` are used.
- The default value of the maximum allowable slenderness ratio, `MAIN`, of 180 is used.
- The beam type is a general member, specified by `CAN 0`

- The beam is laterally supported, specified by `LAT 1`
- The default values of `CMX`, `CMY`, and `CMZ` of 0.9 are used.

V. IS 800 2007 LSD - Pipe - Tension and Bending

Verify the design of a pipe section subject to axial tension and biaxial bending per the IS 800:2007 limit state method.

Details

The member is a 3 m long cantilever subject to a 10 kN tensile force and uniform bending moments of 1 kN/m along both major and minor axes. The section used is a 90 mm nominal bore with a wall thickness of 3.6 mm (STAAD.Pro section designation PIP10106L) and is braced to prevent lateral-torsional buckling. The steel has a yield strength of 250 MPa, an ultimate tensile strength of 420 MPa, and a modulus of elasticity of 205×(10)^3 MPa.

Validation

Section Properties

Outer diameter, $OD = 101.6\ mm$

Wall thickness, $t = 3.6\ mm$

Inner diameter, $ID = 101.6 - 2 \times 3.6 = 94.4\ mm$

Cross-section area, $A_x = \frac{\pi}{4}\left(101.6^2 - 94.4^2\right) = 11.08\ cm^2$

Moment of inertia about both axes, $I = \frac{\pi}{64}\left(101.6^4 - 94.4^4\right) = 133.2\ cm^4$

Radius of gyration about both axes, $r = \sqrt{I / A_x} = 3.47\ cm$

Elastic section modulus about both axes, $Z_e = \frac{I}{OD / 2} = 26.23\ cm^3$

Plastic section modulus about both axes, $Z_p = \frac{1}{6}\left(101.6^3 - 94.4^3\right) = 34.6\ cm^3$

Constants

$\gamma_{m0} = 1.1$
$\gamma_{m1} = 1.25$

Section Classification

$$\varepsilon = \sqrt{250 / f_y} = 1$$

For circular, hollow tubes subjected to moment, $OD/t = 28.22 < 42\varepsilon^2 = 42$

Therefore, the classification of the section is “plastic”.

Hence, from Table 10 of IS 800:2007, the buckling class about both axes is “a”.

Check Slenderness Ratio

$k_y = k_z = 1$

The maximum allowable slenderness ratio is 180.

Slenderness ratio about both axes, $k_z L\ /\ r_z = 86.67 < 180$

So the slenderness is within the limit.

Axial Tension Capacity

Check for yielding of gross section per Cl. 6.2:

$$T_{dg} = A_g \times f_y / \gamma_{m0} = 11.08 \times 250 / 1.1 = 251.8 \text{ kN}$$

Check for rupture of critical section per Cl. 6.3:

$$\alpha = 0.8$$

$$T_{dn} = \alpha \times A_{net} \times f_u / \gamma_{m1} = 0.8 \times 11.08 \times 420 / 1.25 = 297.8 \text{ kN}$$

Block shear areas are not specified and therefore not checked.

The critical tension ratio $10 / 251.8 = 0.040$

Check Axial Compression

The non-dimensional slenderness ratio, $\lambda_z = \sqrt{\frac{f_y (k_z L / r_z)^2}{\pi^2 E}} = 0.961$

For buckling class "a", the imperfection factor, $\alpha = 0.21$

$$\phi_z = 0.5\left[1 + \alpha(\lambda_z - 0.2) + \lambda_z^2\right] = 1.042$$

$$\chi_z = \frac{1}{\phi_z + \sqrt{\phi_z^2 - \lambda_z^2}} = 0.692$$

So, as per Cl. 7.1.2.1 of IS 800:2007, $f_{cdz} = min\left(\frac{\chi_z f_y}{\gamma_{m0}}, \frac{f_y}{\gamma_{m0}}\right) = 157.3\ MPa$

Therefore, axial compression capacity for both axes: $P_{dz} = A_x f_{cdz} = 147.3\ kN$

The critical ratio for axial compression is 0 (i.e., no compression).

Check Shear Capacity

As per Cl. 8.4.1.1 of IS 800:2007, the shear area, $A_{vz} = 2 \times A_x / \pi = 7.054\ cm^2$

So, as per Cl. 8.4.1, $V_{pz} = \frac{A_{vz} f_{yw}}{\sqrt{3}} = 101.8\ kN$

Hence, shear capacity along major axis: $V_{dz} = \frac{V_{pz}}{\gamma_{m0}} = 92.56\ kN$

Shear force along both axes = $3\ kN$.

Critical shear ratio along both axes: $3 / 92.56 = 0.032$

Check Bending Capacity

Since the section has been classified as "plastic", $\beta_b = 1$.

Actual shear force in both axes, $V = 3\ kN < 0.6V_d = 55.53\ kN$. Hence, the section is subjected to low shear.

$$\frac{\beta_b Z_{py} f_y}{\gamma_{m0}} = 7.861 \text{ kN} \cdot \text{m}$$

$$\frac{1.5 Z_e f_y}{\gamma_{m0}} = 8.925 \text{ kN} \cdot \text{m}$$

So, the governing bending strength with respect to the minor axis is $M_{dy} = 7.861\ kN \cdot m$

Actual bending moment about the minor axis is $M_z = 4.5\ kN \cdot m$.

The critical bending ratio in the minor axis is $4.5\ /\ 7.861 = 0.572$

Check Combined Interaction of Axial Compression and Bending

Section strength calculation as per Cl. 9.3.1:

$$n = N / N_d = 0.004$$

Hence, from Table 17:

$$\alpha_1 = 2$$

$$\alpha_2 = 2$$

$$M_{ndy} = M_{dy} = 9.341 \text{ kN} \cdot \text{m} \qquad \text{(Cl. 9.3.1.2(c))}$$

$$1.04 \cdot M_{dz} \cdot (1 - n^{1.7}) = 8.175 \text{ kN} \cdot \text{m} > M_{dz}$$

$$M_{ndz} = M_{dz} = 7.861 \text{ kN} \cdot \text{m}$$

$$\left(\frac{M_y}{M_{ndy}}\right)^{\alpha_1} + \left(\frac{M_{yz}}{M_{ndz}}\right)^{\alpha_2} = \left(\frac{4.5}{7.861}\right)^2 + \left(\frac{4.5}{7.861}\right)^2 = 0.655$$

Overall member strength in bending and axial compression

$$M_{\text{eff}} = M_z - \frac{\psi F_x Z_{ez}}{A_x} = 4.5 - \frac{1.0 \times 10 \times 26.23}{11.08 \times 10^2} = 4.264 \text{ kN} \cdot \text{m}$$

$$M_{\text{eff}} / M_{dz} = 4.263 / 7.861 = 0.542$$

The loading and section is the same in both axes.

Results

Table 673:

Result Type	Reference	STAAD.Pro	Difference	Comments
Slenderness ratio	86.46	86.67	negligible	
Tension capacity, gross yielding (kN)	251.8	252.273	negligible	
Tension capacity, rupture of critical section (kN)	297.8	298.368	negligible	
Axial compression capacity about both axes (kN)	174.3	174.338	negligible	
Shear capacity in both axes (kN)	92.56	92.723	negligible	
Ratio for shear	0.032	0.032	none	

Result Type	Reference	STAAD.Pro	Difference	Comments
Bending capacity about both axes (kN·m)	7.861	7.864	negligible	
Ratio for bending about both axes	0.572	0.572	none	
Ratio per Cl. 9.3.1.1	0.655	0.655	none	
Ratio for both axes per Cl. 9.3.2.1	0.542	0.542	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - Pipe - Tension and Bending.STD` is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1617) are used:

- The default value of `ALPHA` is used.
- The default values of `KY` and `KZ` are used.
- The default value of the maximum allowable slenderness ratio, `MAIN`, of 180 is used.
- The default value of Ψ.
- The beam type is a cantilever, specified by `CAN 1`
- The beam is laterally supported, specified by `LAT 1`

V. IS 800 2007 - LSD Rod Compression and Bending

Verify the program-calculated design results for a 3 m long cantilever beam, subjected to axial compression and biaxial bending. The beam section used is a 50 mm diameter steel rod and is designed as per IS 800:2007.

Details

The 3 m cantilever section is subject to a 10 kN axial compression load at the free end as well as 1 kN/m uniform loads along the length in both the “major” and “minor” axes. The cantilever is assumed to be laterally supported.

The steel yield stress is $f_y = 250\ MPa$, the specified minimum tensile strength is $F_u = 420\ MPa$, and the modulus of elasticity is $E = 205(10)^3\ MPa$

Validation

<u>Section Properties</u>

Gross area:

$$A_g = \frac{\pi(5\text{ cm})^2}{4} = 19.6\text{ cm}^2$$

Moment of inertia:

$$I_y = I_z = \frac{\pi (5\text{ cm})^4}{64} = 30.7\text{ cm}^4$$

Elastic section modulus:

$$Z_e = \frac{I}{D/2} = 12.28\text{ cm}^3$$

Plastic section modulus:

$$Z_p = \frac{(5\text{ cm})^3}{6} = 20.83\text{ cm}^3$$

Radius of gyration:

$$r_{yy} = r_{zz} = \sqrt{\frac{I}{A_g}} = 1.252\text{ cm}$$

Partial Safety Factors

Partial safety factor for failure in tension by yielding (per Table 5 of IS:800 2007), $\gamma_{m0} = 1.1$.

Partial safety factor for failure at ultimate stress (per Table 5 of IS:800 2007), $\gamma_{m1} = 1.25$.

Forces

Axial force, $F_x = 10\ kN$

Shear forces, $F_y = F_z = 1\ kN/m \times 3\ m = 3\ kN$

Moments, $M_y = M_z = \frac{(1\ kN/m) \times (3\ m)^2}{2} = 4.5\ kN \cdot m$

Section Classification

Although Table 2 of IS800:2007 does not specify the classification for solid rod sections, the width to thickness ratio for a solid rod is 1.0. Hence, it is a Class 1 section (Plastic).

Check Slenderness Ratio

$K_y = K_z = 1$

The allowable slenderness ratio is 180.

$$\frac{k_y L}{r_{yy}} = \frac{k_z L}{r_{zz}} = \frac{(1.0) \times 300\text{ cm}}{1.252\text{ cm}} = 239.7 > 180$$

Section fails in slenderness.

Check Axial Tension

The design strength in tension (or compression) due to yielding (per Section 6),

$$T_{dg} = N_d = \frac{A_g \times F_y}{\gamma_{m0}} = \frac{19.6 \times (10)^{-4}\ m^2 \times 250 \times (10)^3 kN/m^2}{1.1} = 445.5\ kN$$

Assume that $A_{net} = A_g$ and $a = 0.8$, the design strength in rupture of critical section,

$$T_{dn} = a \times A_{net} \frac{F_u}{\gamma_{m1}} = 0.8 \times 19.6 \times (10)^{-4}\ m^2 \times \frac{420 \times (10)^3 kN/m^2}{1.25} = 526.8\ kN$$

Check Axial Compression

Per Section 7 of IS: 800-2007

Euler buckling stress, $f_{cc} = \frac{\pi^2 E}{\left(KL/r\right)^2} = \frac{\pi^2 \times 205(10)^3\ MPa}{(239.7)^2} = 35.21\ MPa$

Non-dimensional effective slenderness ratio, $\lambda = \sqrt{\frac{f_y}{f_{cc}}} = \sqrt{\frac{250\ MPa}{35.21\ MPa}} = 2.665$

The imperfection factor given in Table 7; for buckling class (as per Table 10 for solid sections), $a = 0.49$.

$$\phi = 0.5\left[1 + a(\lambda - 0.2) + \lambda^2\right] = 4.654$$

$$\chi = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}} = 0.118$$

The design compressive stress,

$$f_{cd} = \chi \frac{f_y}{\gamma_{m0}} = 0.118 \frac{250}{1.1} = 26.84 \text{ MPa} < \frac{f_y}{\gamma_{m0}} = \frac{250}{1.1} = 227.3 \text{ MPa}$$

The design compressive strength,

$$P_d = A_g f_{cd} = 19.6 \times (10)^{-4} \text{ m}^2 \times 26.84 \times (10)^3 \text{kN}/\text{m}^2 = 52.6 \text{ kN}$$

Design ratio in compression: $\frac{F_x}{P_d} = \frac{10}{52.6} = 0.19$ (for both local z and y axes)

Check for Shear

Per Cl 8.4 and 8.4.1 of IS: 800-2007

Per Cl. 8.4.1.1, the shear area is taken as the gross area of the solid round section; $A_v = A_g = 19.6\ cm^2$.

The shear force used for design is taken as the resultant SRSS combination of the “major” and “minor” axes:

$$V_u = \sqrt{(F_y)^2 + (F_z)^2} = \sqrt{(3 \text{ kN})^2 + (3 \text{ kN})^2} = 4.243 \text{ kN}$$

The plastic under pure shear is taken as the nominal shear strength,

$$V_p = A_v \frac{f_{yw}}{\sqrt{3}} = 19.6 \times (10)^{-4} \text{ m}^2 \times \frac{250 \times (10)^3}{\sqrt{3}} = 282.9 \text{ kN}$$

$$V_d = \frac{V_p}{\gamma_{m0}} = \frac{282.9 \text{ kN}}{1.1} = 257.2 \text{ kN}$$

Design ratio in shear: $\frac{V_u}{V_d} = \frac{4.654}{257.2} = 0.016$

Check for Bending

Per Section 8 of IS: 800-2007

The bending moment used for design is taken as the resultant SRSS combination of the “major” and “minor” axes:

$$M' = \sqrt{(M_y)^2 + (M_z)^2} = \sqrt{(4.5 \text{ kN}\cdot\text{m})^2 + (4.5 \text{ kN}\cdot\text{m})^2} = 6.364 \text{ kN}\cdot\text{m}$$

This is used as the “major” axis bending moment and the “minor” axis bending moment is taken as zero.

When $V < 0.6V_d$ on a cantilever beam, then the design bending strength is taken as:

$$V_u = 4.343 \text{ kN} < 0.6(257.2 \text{ kN}) = 154.3 \text{ kN}$$

$$M_d = \frac{\beta_b \times Z_p \times F_y}{\gamma_{m0}} < \frac{1.5 \times Z_e \times F_y}{\gamma_{m0}}$$

where

β_b = 1

$$M_d = \min \left| \begin{array}{l} \frac{1.0(20.83 \times 10^{-6} \text{ m}^3)(250 \times 10^3 \text{kN/m}^2)}{1.1} = 4.734 \text{ kN·m} \\ \frac{1.5(12.28 \times 10^{-6} \text{ m}^3)(250 \times 10^3 \text{kN/m}^2)}{1.1} = 4.186 \text{ kN·m} \end{array} \right.$$

Design ratio in bending: $\frac{M'}{M_d} = \frac{6.364}{4.186} = 1.52$

Check for Combined Axial Force

Check the reduced flexural strength under combined axial force and the respective uniaxial moment acting alone (Cl. 9.3.1.2).

The ratio for the compression yielding is $n = \frac{N}{N_d} = 0.022$

$$M_{nd,max} = 1.04 \times M_d(1 - n^{1.7}) = 1.04 \times 4.186 \text{ kN·m}(1 - 0.022^{1.7}) = 4.347 \text{ kN·m}$$

Use $M_d = 4.186$ kN·m.

The combined bending ratio is taken as:

$$\left(\frac{M_y'}{M_{nd,y}}\right)^{a_1} + \left(\frac{M_z'}{M_{nd,z}}\right)^{a_2}$$

where

a_1 = 1

a_2 = 1

$$\left(\frac{0}{4.186}\right)^{1.0} + \left(\frac{6.364}{4.186}\right)^{1.0} = 1.52$$

Check for Combined Axial Force and Bending Moment

Per Cl 9.3.2.2 of IS: 800-2007

$$K_y = K_z = \min \left| \begin{array}{l} 1 + (\lambda - 0.2)n = 1 + (2.665 - 0.2)0.19 = 1.468 \\ 1 + 0.8n = 1 + 0.8 \times 0.19 = 1.152 \end{array} \right.$$

$$K_{LT} = 1.0$$

$$\frac{P}{P_{dy}} + K_y\left(\frac{C_{my} \times M_y}{M_{dy}}\right) + K_{LT}\frac{M_z}{M_{dz}} = 0.19 + 1.152\left(\frac{0.9 \times 4.5}{4.186}\right) + 1.0\frac{4.5}{4.186} = 2.380$$

$$\frac{P}{P_{dy}} + K_y\left(\frac{C_{my}\sqrt{M_y^2 + M_z^2}}{M_{dy}}\right) + 0 = 0.19 + 1.152\left(\frac{0.9\sqrt{4.5^2 + 4.5^2}}{4.186}\right) + 0 = 1.766$$

$$\frac{P}{P_{dz}} + 0.6K_y\left(\frac{C_{my} \times M_y}{M_{dy}}\right) + K_z\left(\frac{C_{mz} \times M_z}{M_{dz}}\right) = 0.19 + 0.6 \times 1.152\left(\frac{0.9 \times 4.5}{4.186}\right) + 1.152\left(\frac{0.9 \times 4.5}{4.186}\right) = 1.973$$

Results

Table 674: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Slenderness ratio	239.7	239.71	negligible	
Yielding tension capacity (kN)	445.5	445.455	negligible

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 LSD - ROD - Compression and Bending.STD` is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1617) are used:

- The lateral support condition is specified by `LAT 1`
- The cantilever member is specified by `CAN 1`

V. IS 800 2007 - WSD Rod Compression and Bending

Verify the program-calculated design results for a 3 m long cantilever beam, subjected to axial compression and biaxial bending. The beam section used is a 50 mm diameter steel rod and is designed as per IS 800:2007 working stress design method.

Details

The 3 m cantilever section is subject to a 10 kN axial compression load at the free end as well as 1 kN/m uniform loads along the length in both the “major” and “minor” axes. The cantilever is assumed to be laterally supported.

The steel yield stress is $f_y = 250\ MPa$, the specified minimum tensile strength is $F_u = 420\ MPa$, and the modulus of elasticity is $E = 205(10)^3\ MPa$

Validation

Section Properties

Gross area:

$$A_g = \frac{\pi(5\text{ cm})^2}{4} = 19.6\text{ cm}^2$$

Moment of inertia:

$$I_y = I_z = \frac{\pi(5\text{ cm})^4}{64} = 30.7\text{ cm}^4$$

Elastic section modulus:

$$Z_e = \frac{I}{D/2} = 12.28\text{ cm}^3$$

Plastic section modulus:

$$Z_p = \frac{(5\text{ cm})^3}{6} = 20.83\text{ cm}^3$$

Radius of gyration:

$$r_{yy} = r_{zz} = \sqrt{\frac{I}{A_g}} = 1.252\text{ cm}$$

Partial Safety Factors

Partial safety factor for failure in tension by yielding (per Table 5 of IS:800 2007), $\gamma_{m0} = 1.1$.

Partial safety factor for failure at ultimate stress (per Table 5 of IS:800 2007), $\gamma_{m1} = 1.25$.

Forces

Axial force, $F_x = 10\ kN$

Shear forces, $F_y = F_z = 1\ kN/m \times 3\ m = 3\ kN$

Moments, $M_y = M_z = \frac{(1\ kN/m) \times (3\ m)^2}{2} = 4.5\ kN{\cdot}m$

Section Classification

Although Table 2 of IS800:2007 does not specify the classification for solid rod sections, the width to thickness ratio for a solid rod is 1.0. Hence, it is a Class 1 section (Plastic).

Check Slenderness Ratio

$K_y = K_z = 1$

The allowable slenderness ratio is 180.

$$\frac{k_y L}{r_{yy}} = \frac{k_z L}{r_{zz}} = \frac{(1.0) \times 300\text{ cm}}{1.252\text{ cm}} = 239.7 > 180$$

Section fails in slenderness.

Check Axial Tension

The permissible stress in compression/tension due to yielding (per Section 11.2.1(a)),
$f_{atg} = 0.6 f_y = 0.6 \times 250\ MPa = 150\ MPa$

Assume that $A_{net} = A_g$ and $a = 0.8$, the design strength in rupture of critical section,

$$T_{dn} = a \times A_{net} \frac{F_u}{\gamma_{m1}} = 0.8 \times 19.6 \times (10)^{-4}\ m^2 \times \frac{420 \times (10)^3 kN / m^2}{1.25} = 526.8\ kN$$

The permissible stress governed by rupture of the net section,

$$f_{att} = 0.69 \frac{T_{dn}}{A_g} = 0.69 \frac{526.8\ kN (10)^3}{19.6 \times (10)^{-4}\ m^2} = 185.5\ MPa$$

<u>Check Axial Compression</u>

Per section 11.3 of IS:800 2007.

The actual compression under service load, $f_c = \frac{P_s}{A_e} = \frac{F_x}{A_g} = \frac{10\ kN \times (10)^3}{19.6 \times (10)^{-4}\ m^2} = 5.102\ MPa$

Euler buckling stress, $f_{cc} = \frac{\pi^2 E}{\left(KL / r \right)^2} = \frac{\pi^2 \times 205 (10)^3\ MPa}{(239.7)^2} = 35.21\ MPa$

Non-dimensional effective slenderness ratio, $\lambda = \sqrt{\frac{f_y}{f_{cc}}} = \sqrt{\frac{250\ MPa}{35.21\ MPa}} = 2.665$

The imperfection factor given in Table 7; for buckling class (as per Table 10 for solid sections), $a = 0.49$.

$$\phi = 0.5 \left[1 + a(\lambda - 0.2) + \lambda^2 \right] = 4.654$$

$$\chi = \frac{1}{\phi + \sqrt{\phi^2 - \lambda^2}} = 0.118$$

The design compressive stress,

$$f_{cd} = \chi \frac{f_y}{\gamma_{m0}} = 0.118 \frac{250}{1.1} = 26.84 \text{ MPa} < \frac{f_y}{\gamma_{m0}} = \frac{250}{1.1} = 227.3 \text{ MPa}$$

$$f_{ac} = 0.6 \times f_{cd} = 0.6 \times 26.84 \text{ MPa} = 16.10 \text{ MPa}$$

Design ratio in compression: $\frac{f_c}{f_{ac}} = \frac{5.102}{16.10} = 0.317$ (for both local z and y axes)

<u>Check for Shear</u>

Per Cl 11.42 of IS: 800-2007

Per Cl. 8.4.1.1, the shear area is taken as the gross area of the solid round section; $A_v = A_g = 19.6\ cm^2$.

The shear force used for design is taken as the resultant SRSS combination of the “major” and “minor” axes:

$$V_u = \sqrt{(F_y)^2 + (F_z)^2} = \sqrt{(3 \text{ kN})^2 + (3 \text{ kN})^2} = 4.243 \text{ kN}$$

The plastic under pure shear is taken as the nominal shear strength,

$$\tau_b = \frac{V_s}{A_v} = \times \frac{4.243 \text{ kN}}{19.6 \times (10)^{-4} \text{ m}^2} = 2.165 \text{ MPa}$$

The permissible shear stress at working load, $\tau_{ab} = 0.4 f_y = 0.4 \times 250\ MPa = 100\ MPa$

Design ratio in shear: $\frac{\tau_s}{\tau_{ab}} = \frac{2.165}{100} = 0.022$

<u>Check for Bending</u>

Per Section 11.4 of IS: 800-2007

The bending moment used for design is taken as the resultant SRSS combination of the “major” and “minor” axes:

$$M' = \sqrt{(M_y)^2 + (M_z)^2} = \sqrt{(4.5\ \text{kN}\cdot\text{m})^2 + (4.5\ \text{kN}\cdot\text{m})^2} = 6.364\ \text{kN}\cdot\text{m}$$

This is used as the “major” axis bending moment and the “minor” axis bending moment is taken as zero.

The actual bending stress, $f_b = \frac{M_s}{Z_e} = \frac{6.364 kN\cdot m \times 10^3}{12.28\ cm^3} = 518.2\ MPa$

The permissible bending stress at working load, $f_{ab} = 0.66 f_y = 0.66 \times 250\ MPa = 165\ MPa$

Design ratio in bending: $\frac{f_b}{f_{ab}} = \frac{518.2}{165} = 3.141$

<u>Check for Combined Axial Force and Bending</u>

As per Cl. 11.5.2(a) of IS: 800 2007.

$$C_{mLT} = 0.9$$

$$K_y = K_z = \min \begin{cases} 1 + (\lambda - 0.2)(f_c / f_{ac}) = 1 + (2.665 - 0.2)0.317 = 1.781 \\ 1 + 0.8(f_c / f_{ac}) = 1 + 0.8(0.317) = 1.254 \end{cases}$$

$$K_{LT} = -\frac{0.1(f_c / f_{ac})}{C_{mLT} - 0.25} = -\frac{0.1(0.317)}{0.9 - 0.25} = -0.049$$

$$\frac{f_c}{f_{ac}} + 0.6 K_y C_{my} \frac{f_{bcy}}{f_{abcy}} + K_{LT} \frac{f_{bc}}{f_{abcz}} = 0.317 + 0.6(1.254)(0.9)(0) - 0.049(3.141) = 0.163$$

$$\frac{f_c}{f_{ac}} + 0.6 K_y C_{my} \frac{f_{bcy}}{f_{abcy}} + K_z C_{mz} \frac{f_{bc}}{f_{abcz}} = 0.317 + 0.6(1.254)(0.9)(0) + 1.254(0.9)(3.141) = 3.862$$

As per Cl. 11.5.2(b) of IS: 800 2007.

$$\frac{f_c}{0.6 f_y} + \frac{f_{bcy}}{f_{abcy}} + \frac{f_{bcz}}{f_{abcz}} = \frac{5.102}{0.6(250)} + \frac{0}{165} + 3.141 = 3.175$$

Results

Table 675:

Result Type	Reference	STAAD.Pro	Difference	Comments
Slenderness ratio	239.7	239.71	negligible	

Result Type	Reference	STAAD.Pro	Difference	Comments
Allowable stress in tension yielding on gross section (MPa)	150	150	none	
Allowable stress in tension rupture on critical section (MPa)	185.5	185.472	negligible	
Allowable stress in compression (MPa)	16.10	16.101	negligible	
Critical ratio for axial compression	0.317	0.317	none	
Allowable stress in shear (MPa)	100	100	none	
Shear stress ratio	0.022	0.022	none	
Allowable stress in bending (MPa)	165	165	none	
Bending stress ratio	3.141	3.141	none	
Interaction ratio for Cl. 11.5.2(a)(ii)	3.862	3.860	negligible	
Interaction ratio for Cl. 11.5.2(b)	3.175	3.175	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\India\IS 800 2007 WSD - ROD - Compression and Bending.STD` is typically installed with the program.

The following D8.A.4 Design Parameters (on page 1617) are used:

- The lateral support condition is specified by `LAT 1`
- The cantilever member is specified by `CAN 1`

V. IS 801-Beam with axial and major axis bending

Verification example for a cold-formed beam subject to axial compression and bending moment according to IS: 801-1975.

Details

Verifies the calculations for an IS 60CU40x4 (Channel without lips) beam that is 2 m long and subject to axial compression and major axis bending moment. This example checks for compression, shear, bending and compression and bending interaction as per IS 801.

Material properties:

$E = 2{,}074{,}000\ kgf/cm^2 = 203{,}400\ MPa$
$F_{yi} = 350.0\ MPa = 3{,}569\ kgf/cm^2$
$F_u = 450\ MPa$
$G = 795{,}000\ kgf/cm^2 = 77{,}963\ MPa$

Design forces:

$P = 0.5\ kN$
$M_z = 0.748\ kN{\cdot}m$
$V_y = 1.874\ kN$

Verification

Section Dimension Checks

Check for flat width ratio:

$$w = b - (r + t) = r - (0.4 + 0.6) = 3\text{ mm}$$

$$w/t = 3 / 0.4 = 7.5 < 60$$

Hence, OK (ref. cl 5.2.3(a))

$$h_w/t = (d - 2\times t_f - 2\times \text{ root radius}) / t = (6 - 2\times0.4 - 2\times0.6)/0.4 = 10 < 500$$

Hence, OK (ref. cl 5.2.3(b))

Check for web height to thickness ratio:

$$h/t = (6 - 2\times0.4) / 0.4 = 13 < 150$$

Hence, OK (ref. cl 5.2.4(a))

Check for limiting slenderness

$$k\frac{L_y}{r_y} = 1.0\frac{200\ mm}{1.263\ mm} = 158.3\ < 200$$

Hence, OK (ref. cl 6.3.3)

Calculation of Allowable Compressive Stress

For calculation of axially loaded member, " Q " is an important factor. The definition and method of calculation for value of Q is provided in Clause no. 6.6.1.1 (a). Channel section without lips is a combination of stiffened & unstiffened elements.

As per clause no 6.1.1.1 of IS801, the increase of steel strength happens due to cold work of forming.

Total corner area, $A_{corner} = 2(45.2\ mm^2) = 91.2\ mm^2 = 0.912\ cm^2$

Total area of flanges, $A_{flange} = 2 \times b \times t = 2(0.4)(0.4) = 3.2\ cm^2$

$$C = A_{corner} / A_{flange} = 0.931 / 3.2 = 0.285$$

Effective depth, $h_e = h = 4\ cm$

Therefore, effective area, $A_e = A = 4.91\ cm^2$

$$B_e = 3.69\frac{F_u}{F_y} - 0.819\left(\frac{F_u}{F_y}\right)^2 - 1.79 = 1.6004$$

$$m = 0.192\frac{F_u}{F_y} - 0.068 = 0.1789$$

Tensile yield point of corner, $F_{yc} = \dfrac{B_e \times F_y}{\left(\frac{r}{t}\right)^m} = 521.0\ MPa$

Tensile yield point of flat portions, $F_{yt} = F_y = 350.0\ MPa$

Average yield point of cold-forming for tension/compression members, $F_{ya(compression)} = (C \times F_{yc}) + (1 - C) \times F_{yc} = 381.8\ MPa\ (= 3{,}893\ kgf/cm^2)$

Average yield point of cold-forming for flexural members, $F_{ya(bending)} = (C \times F_{yc}) + (1 - C) \times F_{yc} = 398.8\ MPa$

$$w = 3\text{ cm}$$

$$w / t = 7.5$$

As per cl. 6.2 of IS 801, compressive stress:

$$F_c = 0.6 \times F_{ya} = 0.6 \times 381.8 = 229.1\text{ MPa}$$

$$Q_s = \frac{F_c}{0.6F_{ya}} = \frac{229.1}{229.1} = 1$$

$$h = d - 2(r + t) = 4\text{ cm}$$

$$\frac{h}{t} = 13 < \frac{1435}{\sqrt{Fc}} = 29.69$$

$$Q_a = \frac{A_e}{A} = 1$$

$$Q = Q_s \times Q_a = 1$$

Allowable compression stress, F_{a1} , for members braced against twisting (ref. cl 6.6.1.1)

$$C_e = \sqrt{\frac{2\pi E}{F_{ya}}} = 102.5$$

$$\frac{C_e}{\sqrt{Q}} = 102.5$$

Slenderness ratio $KL/r = 158.3$

$$F_{a1} = \frac{12}{23}Q \times F_{ya} - \frac{3(Q \times F_{ya})}{23\pi^2 E}\left(\frac{KL}{r}\right)^2 = 41.06\ MPa$$

Maximum allowable compressive stress (Fa2) for flexural-torsional buckling (ref. cl 6.6.1.2 of IS 801)

$$r_0 = \sqrt{(r_x{}^2) + (r_y{}^2) + (x_0{}^2)} = 3.732\ cm$$

$$\sigma_x = \pi^2 \times \frac{E}{\left(K_x \frac{L_x}{r_x}\right)^2} = 274.8\ MPa$$

$$\beta = 1 - \left(\frac{x_0}{r_x}\right)^2 = 0.5071$$

$$\sigma_t = \frac{1}{A \times r_o{}^2} \times \frac{(G \times J) + (\pi^2 \times E \times C_w)}{(K_x \times L_x)^2} = 324.2\ MPa$$

$$\sigma_{TF0} = \frac{1}{2\beta}\left[(\sigma_{ex} + \sigma_t) - \sqrt{(\sigma_{ex} + \sigma_t)^2 - 4\beta \times \sigma_{ex} \times \sigma_t}\right] = 174.5 \text{ MPa}$$

$$F_{qy} = F_y \times Q = 381.8 \text{ MPa}$$

$$F_{a2} = 0.522 \times \sigma_{TF0} = 91.09 \text{ MPa}$$

The allowable compressive stress, F_a is the minimum of F_{a1} and F_{a2} :

$$F_a = 41.06 \text{ MPa}$$

Calculation of Allowable Bending Stress

As per clause number 6.1, maximum allowable stress on extreme fiber is:

$$F = 0.6 \times F_{ya(compression)} = 0.6 \times 381.8 \text{ MPa} = 229.1 \text{ MPa}$$

As the section is channel without lips, the flanges are unstiffened. So, as per clause 6.2 we need to check allowable compressive stress on the unstiffened element.

$$\frac{w}{t} = 7.5 < \frac{530}{\sqrt{F_{ya}}} = \frac{530}{\sqrt{3{,}893\ kgf / cm^2}} = 8.494$$

Also, the yield strength of steel, $F_y > 2{,}230\ kgf/cm^2$ (= 227.5 MPa).

$$F_c = 0.6 \times F_{ya(compression)} = 229.1 \text{ MPa}$$

For the major axis bending, the allowable compressive stress, F_{bc} , is the minimum of F and F_c

$$F_{bc} = 229.1 \text{ MPa}$$

Similarly, for major axis bending, the allowable tensile stress, $F_{bt} = 0.6 \times F_{ya(compression)} = 229.1\ MPa$

Calculate the allowable bending stress for laterally unbraced beams:

Allowable bending stress for laterally unbraced beams has been calculated as per clause 6.3 (a).

Unsupported length, $L = 2\ m$ (the `UNL` parameter can be used for this).

$$S_{xc} = Z_{xx} = 8.93 \text{ cm}^3$$

$C_b = 1.0$ for a member under compression and bending.

$$\frac{L^2 \times S_{xc}}{d \times I_{yc}} = 14{,}140 > 1.8\pi^2 E \frac{C_b}{F_{ya(compression)}} = 9{,}464$$

$$F_b = 0.6\pi^2 E \times C_b \frac{d \times I_{yc}}{L^2 \times S_{xc}} = 85.18\ MPa$$

Allowable bending stress in the web:

$$F_{bw1} = \frac{36{,}560{,}000}{\left(h/t\right)^2} = 216{,}330 \frac{kgf}{cm^2} = 21{,}215\ MPa$$

Per cl. 6.4.2, F_{bw} is the minimum of F_{bw1} and $0.6 \times F_{ya(bending)} = 239.2\ MPa$

$$F_{bw} = 239.2 \text{ MPa}$$

<u>Calculation of Allowable Shear Stress</u>

Per cl. 6.4:

Clear distance between flanges = $h = d - 2t = 52\ mm$

$$F_{v1} = \frac{1275 \times \sqrt{F_y}}{h/t} = 577.1042\ MPa \qquad \text{(cl. 6.4.1(a))}$$

$$F_{v2} = \frac{585000}{\left(h/t\right)^2} = 3{,}395\ MPa \qquad \text{(cl. 6.4.1(b))}$$

$$\frac{h}{t} = 13 < \frac{4{,}590}{\sqrt{F_y}} = 76.8$$

Allowable shear stress, F_v is the minimum of F_{v1} or $0.4 \times F_y = 140.1\ MPa$

$$F_v = 140.1 \text{ MPa}$$

Allowable combined bending and shear stress:

As $h/t < 4590/\sqrt{F_y}$, $F_{vc} = F_{vc1} = 577.1\ MPa$

<u>Actual Stresses</u>

Compression

$$f_a = P/A = 0.5 \text{ kN} / 4.91 \text{ mm}^2 = 1.018 \text{ MPa}$$

Bending

$$f_b = M / Z_{xx} = 0.748 \text{ kN·m} / 8.93 \text{ cm}^3 = 83.76 \text{ MPa}$$

Bending in Web

Actual bending stress in the web is calculated by interpolation of bending stress diagram:

$$f_{bw} = f_b \times \left(1 - t/_{0.5 \times d}\right) = 72.59\ MPa$$

Shear

$$f_v = \frac{V_y}{N_w t(d - 2t)} = \frac{1.874(10)^3}{(1)4(60 - 2 \times 4)} = 9.01\ MPa$$

<u>Stress Ratio</u>

Compression

$$f_a / F_a = 1.018 / 41.06 = 0.024$$

Bending

for bending compression: f_b / F_{bc} = *83.76 / 229.1 = 0.366*
for bending tension: f_b / F_{bt} = *83.76 / 229.1 = 0.366*
for unbraced bending: f_b / F_b = *83.76 / 85.18 = 0.983*
for web bending: f_{bw} / F_{bw} = *72.59 / 239.2 = 0.303*

Shear

$$f_v / F_v = 9.01 / 140.1 = 0.064$$

Combined bending and shear (ref. cl 6.4.3 of IS 801):

$$\sqrt{\left(\frac{f_{bw}}{F_{bw1}}\right)^2 + \left(\frac{f_{vy}}{F_{vy1}}\right)^2} = \sqrt{\left(\frac{75.59}{21,215}\right)^2 + \left(\frac{9.01}{577.1}\right)^2} = 0.016$$

Interaction ratio for axial and bending

As $Q = 1.0$, F_{a0} can be calculated using cl. 6.6.1.1(b) with $L = 0$:

$$F_{a0} = \frac{12}{23} Q \times F_{ya} - \frac{3(Q \times F_{ya})^2}{23\pi^2 E}\left(\frac{K^*L}{r}\right)^2 = 182.6\ MPa$$

$$\frac{f_a}{F_{a0}} + \frac{f_{b1}}{F_{b1}} = \frac{1.018}{182.6} + \frac{83.76}{229.1} = 0.371 \quad \text{(6.7.2(a) - 2nd eq)}$$

Results

Table 676: Comparison of results

V. IS 801-Column with axial and major axis bending

Verification example for a cold-formed column subject to axial compression and bending moment according to IS:801-1975.

Details

Verifies the calculations for an IS 60CS40x4 (channel with lips) column that is 2 m long and subject to axial compression and major axis bending moment. This example checks for compression, shear, bending, and compression and bending interaction as per IS 801.

Material properties:

$E = 2{,}074{,}000\ kgf/cm^2 = 203{,}400\ MPa$
$F_y = 3{,}569\ kgf/cm^2 = 353.0\ MPa$
$F_u = 4{,}588\ kgf/cm^2 = 450\ MPa$
$G = 795{,}000\ kgf/cm^2 = 77{,}963\ MPa$

Design forces:

$P = 10\ kN$
$M_z = 4.0\ kN{\cdot}m$
$V_y = 2\ kN$

Verification

Section Dimension Checks

Flanges (ref. cl 5.2.3):

$$w = 4 - 2\times 0.4 - 2\times 0.6 = 2$$

$w/t = 2\ /\ 0.4 = 5 < 60$, Hence OK

Web (ref. cl 5.2.4):

$W/t = (6 - 2\times 0.4 - 2\times 0.6)\ /\ 0.4 = 10 < 500$ and

$h/t = (6 - 2\times 0.4)\ /\ 0.4 = 13 < 150$, Hence OK

Check for limiting slenderness (ref. cl 6.3.3):

$$K\times L_y/r_y = 1.0\times 200\text{ mm} / 1.453\text{ mm} = 137.6 < 200$$

Hence, OK

Allowable Compression Strength

Maximum allowable compressive stress for flexural buckling Y (ref. cl 6.6.1.1 of IS 801)

Design stress, $F = 0.6\times f_y = 2{,}160\ kgf/cm^2 = 211.8\ MPa$

Effective width of flange, B_{eff}

$$W = 4 - 2\times 0.4 - 2\times 0.6 = 2\text{ cm}$$

$$\frac{w}{t} = 5 < \frac{1{,}435}{\sqrt{F}} = 30.87$$

B_{eff} = w = 2 cm

Effective width of web, B_{eff}

W/t < 30.87

B_{eff} = w = 10 cm

A_{eff} = 5.8 cm^2

Factor, $Q = A_{eff} / A = 1.0$=

$$C_e = \sqrt{\frac{2\pi^2 E}{F_y}} = 106.6$$

Slenderness limit $= \frac{C_e}{\sqrt{Q}} = 106.6 < 137.6$

$$F_{a1} = \frac{10{,}680{,}000}{(kL\ /r)^2} = 564.1\ kgf \Big/ cm^2$$

Maximum allowable compressive stress for flexural torsional buckling (ref. cl 6.6.1.2 of IS 801)

Polar radius of gyration, $r_0 = \sqrt{r_x{}^2 + r_y{}^2 + x_0{}^2} = 5.181\ cm$

$$\beta = 1\ -\ (x_0 / r_0)^2 = 0.259$$

σ_t = 2,036 kgf/cm^2

σ_{ex} = 2,480 kgf/cm^2

$$\sigma_{TF0} = \frac{1}{2\beta}\left[(\sigma_{ex} + \sigma_t)\ -\ \sqrt{(\sigma_{ex} + \sigma_t)^2 - 4\beta \times \sigma_{ex} \times \sigma_t}\right] = 1{,}201\ \text{kgfcm}^2 = 117.8\ \text{MPa}$$

1,201 kgf/cm^2 < 0.5×F = 1,800 kgf/cm^2

$F_{a2} = 0.522 \times \sigma_{TF0}$ = 626.9 kgf/cm^2

The allowable compressive stress, F_a is the minimum of F_{a1} and F_{a1} .

F_a = 546.1 kgf/cm^2 = 55.32 MPa

<u>Allowable Bending Strength</u>

$C = 1.0$ for member under combined axial and bending.

$$F_b = \frac{2}{3}F_y\ -\ \frac{F_y{}^2}{54\pi^2 E\ \cdot\ C_b}\left(\frac{L^2 S_{xc}}{d \times I_{yc}}\right) = 1{,}412\ kgf \Big/ cm^2 = 138.5\ MPa \qquad \text{(ref. cl 6.3)}$$

Maximum allowable compressive stress:

$F_{b1} = 0.6 \times F_y$ = 2,160 kgf/cm^2 = 211.8 MPa

<u>Allowable Shear Strength</u>

$$\frac{h}{t} = 13\ <\ \frac{4{,}590}{\sqrt{F_y}} = 76.5$$

$$F_{v1} = \frac{1{,}275\sqrt{F_y}}{(h\ /t)} = 5{,}884\ kgf \Big/ cm^2$$

$$F_{v2} = 0.4F_y = 1{,}440\ kgf \big/ cm^2$$

The allowable shear stress, F_v is the minimum of F_{v1} and F_{v2} :

F_v = 1,440 kgf/cm^2 = 141.3 MPa

<u>Axial and Bending Interaction</u>

f_a = P / A = 10 kN / 5.8 cm^2 = 1,019.7 kgf / 5.8 cm^2 = 175.8 kgf/cm^2

f_{b1} = M / Z = 4.0 kN·m / 9.4 cm^3 = 40,789 kgf·cm / 9.4 cm^3 = 4,339 kgf/cm^2

C_{mx} = 0.6

F'_e = 1,294 kgf/cm^2

$$\frac{f_a}{F_{a1}} + \frac{f_{b1}C_m}{F_{b1}\left[1 - \frac{f_a}{F'_e}\right]} = \frac{175.8}{564.1} + \frac{4{,}339(0.6)}{2{,}160\left[1 - \frac{175.8}{1{,}294}\right]} = 0.312 + 1.395 = 1.705$$

Hence, not OK

F_{a0} = 1,879 kgf/cm^3

$$\frac{f_a}{F_{a0}} + \frac{f_{b1}}{F_{b1}} = \frac{175.8}{1{,}879} + \frac{4339}{2{,}160} = 0.094 + 2.009 = 2.103$$

Results

Table 677: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Allowable compressive stress (MPa)	55.32	55.371	negligible	
Allowable bending stress (MPa)	211.8	211.854	negligible	
Allowable unbraced bending stress (MPa)	138.5	138.583	negligible	
Allowable shear stress along Y (MPa)	141.3	141.236	negligible	
Axial and Bending interaction	2.103	2.102	negligible

V. IS 801-Pipe subject to axial compression and bending

Verification example for a cold-formed beam subject to axial compression and bending moment according to IS: 801-1975.

Details

The section used is an ST 101.6x2.6CHS (pipe) section. The beam is a 6 m span subject to axial compression and bending moments. Both ends of the span are fixed.

Material properties:

$E = 203{,}400\ MPa$
$F_y = 353.0\ MPa$

Design forces:

$P = \pm 2.5\ kN$
$M_z = 3.88\ kN{\cdot}m$
$V_y = 3.88\ kN$

Section properties:

Outer diameter, $OD = 101.6\ mm$
Thickness, $t = 2.6\ mm$
Area, $A = 8.09\ cm^2$
Moment of inertia about the major axis, $I_{zz} = 99.1\ cm^3$

Section modulus about the major axis, $Z_{xx} = 19.51\ cm^3$

Verification

Compressive Stress

Radius of gyration, $r_x = \sqrt{\frac{I_{zz}}{A}} = \sqrt{\frac{99.1}{8.09}} = 3.50\ cm$

Allowable compression stress:

$$C_e = \sqrt{\frac{2\pi^2 E}{F_y}} = \sqrt{\frac{2\pi^2 \times 203{,}404}{353.1}} = 106.6$$

$$Q = 1$$

$$\frac{C_e}{\sqrt{Q}} = \frac{106.6}{\sqrt{1.0}} = 106.6 < {KL}/{r} = \frac{1.0(600)}{3.50} = 171.4$$

Therefore, the allowable compressive stress:

$$F_c = \frac{12\pi^2 E}{23\left({KL}/{r}\right)^2} = \frac{12\pi^2 \times 203{,}404}{23(171.4)^2} = 35.65\text{ MPa}$$

Actual stress in compression

$$f_c = \frac{P}{A} = \frac{2.5 \times 10^3}{8.09 \times 10^2} = 3.09\text{ MPa}$$

Stress ratio in compression: $3.09\ /\ 35.65 = 0.087$

Bending Stress

Avg. diameter = 101.6 mm - 2.6 mm = 99.0 mm

$$\frac{D}{t} = \frac{99.0}{2.6} = 38.1 < \frac{232{,}000}{F_y} = \frac{232{,}000}{353.1} = 657.0$$

Per Cl. 6.8, the maximum allowable stress in bending:

$$F = 0.6 \times F_y = 0.6 \times 353.1 = 211.9\text{ MPa}$$

Actual bending stress:

$$f_b = \frac{M}{Z_{xx}} = \frac{3.88 \times 10^3}{19.51} = 198.9\text{ MPa}$$

Stress ratio in bending: $198.9\ /\ 211.9 = 0.939$

Tensile Stress

Allowable tension stress:

$$F = 0.6 \times F_y = 0.6 \times 353.1 = 211.9\text{ MPa}$$

Actual stress in tension

$$f_t = \frac{P}{A} = \frac{2.5 \times 10^3}{8.09 \times 10^2} = 3.09\text{ MPa}$$

Stress ratio in tension: $3.09\ /\ 211.9 = 0.015$

Calculation of Allowable Shear Stress

Allowable shear stress:

$$F_v = 0.4 \times F_y = 0.4 \times 353.1 = 141.2 \text{ MPa}$$

Shear area:

$$A_z = 0.5 \times 2\pi\left(10.16/2\right)0.26 = 4.15 \text{ cm}^2$$

Actual shear stress:

$$f_v = \frac{V_y}{A_z} = \frac{3.88(10)}{4.15} = 9.349 \text{ MPa}$$

Stress ration in shear: $9.35 \ / \ 141.2 = 0.066$

Results

V. IS 801-Zee with lips having axial compression and bending

Verification example for a cold-formed beam subject to axial compression and bending moment according to IS: 801-1975.

Details

The section used is a IS 125ZS45x2.55 section. The beam is a 2 m span subject to axial compression and major axis bending moments. The span is a propped cantilever (one end fixed, the other pinned).

Material properties:

$E = 203{,}400\ MPa = 2{,}074{,}000\ kgf/cm^2$
$F_{yi} = 350\ MPa = 3{,}569\ kgf/cm^2$
$G = 77{,}968\ MPa = 795{,}000\ kgf/cm^2$

Design forces:

$P = 25\ kN$
$M_z = 2.71\ kN{\cdot}m$
$V_y = 6.85\ kN$

Section properties:

Depth of section, $d = 125\ mm$
Width of section, $b = 45\ mm$
Thickness, $t = 2.55\ mm$
Length of lips, $c = 20\ mm$
Fillet radius, $r = 3.825\ mm$
Area, $A = 5.94\ cm^2$
Moment of inertia about the major axis, $I_{zz} = 135\ cm^3$
Moment of inertia about the minor axis, $I_{yy} = 27.5\ cm^3$
Section modulus about the major axis, $Z_{xx} = 21.6\ cm^3$
Section modulus about the minor axis, $Z_{yy} = 6.3\ cm^3$
Torsion constant, $J = 0.125\ cm^4$
Warping constant, $C_w = 834\ cm^6$
Number of corners, $N_c = 4$
Area of corner, $A_c = 74\ mm^2$

Verification

Section Dimension Checks

Check flat width ratio per Cl. 5.2.3:

$$w = b - 2 \times (r + t) = 4.5 - 2 \times (0.3825 + 0.255) = 3.225 \text{ cm}$$

$$\frac{w}{t} = \frac{3.225}{0.255} = 12.65 < 60$$

Hence, OK.

Check web height to thickness ratio per Cl. 5.2.4:

$$h = D - 2(t + r) = 125 - 2\times(2.55 + 3.825) = 112.3 \text{ mm}$$

$$\frac{h}{t} = \frac{11.23}{0.255} = 44.02 < 150$$

Hence, OK.

Check slenderness ratio limits per Cl. 6.3.3:

Radius of gyration, about major axis $r_x = \sqrt{\frac{I_{zz}}{A}} = \sqrt{\frac{135}{5.94}} = 4.77\ cm$

$$KL/r_x = \frac{1.0(200)}{4.77} = 41.95$$

Radius of gyration, about minor axis $r_y = \sqrt{\frac{I_{yy}}{A}} = \sqrt{\frac{27.5}{5.94}} = 2.15\ cm$

$$KL/r_y = \frac{1.0(200)}{2.15} = 92.95 < 200$$

Hence, OK.

Compressive Stress Actual stress in compression

$$f_c = \frac{P}{A} = \frac{25 \times 10^3}{5.94 \times 10^2} = 42.1 \text{ MPa} = 429 \text{ kgf/cm}^2$$

Calculate the factor, Q, per Cl. 6.6.1.1(a):

$$F_c = 0.6 \times F_y = 0.6 \times 350 = 210 \text{ MPa} = 2{,}141 \text{ kgf/cm}^2$$

$$\frac{w}{t} = 12.65 < \frac{1{,}435}{\sqrt{F_c}} = \frac{1{,}435}{\sqrt{2{,}141}} = 31.0$$

Therefore, $b_{eff} = w = 3.225\ cm$ and $A_{lost,f} = (w - b_{eff}) \times t = 0\ cm^2$

Compression stress:

$$Q_s = \frac{F_c}{0.6 \times F_y} = 1.0$$

$$\frac{h}{t} = 44.02 > \frac{1{,}435}{\sqrt{F_c}} = 31.0$$

Calculate the effective depth of the section by re-arranging the flange ratio:

$$h_{\text{eff}} = t \times \frac{2{,}120}{\sqrt{f}}\left[1 - \frac{465}{(h/t)\sqrt{f}}\right] = 0.255 \times \frac{2{,}120}{\sqrt{2{,}141}}\left[1 - \frac{465}{(44.02)\sqrt{2{,}141}}\right] = 9.015 \text{ cm} \quad (5.2.1.1)$$

and $A_{lost,d} = (h - h_{eff}) \times t = (11.23 - 9.015) \times 0.255 = 0.565\ cm^2$

Therefore the effective area, $A_{eff} = A - A_{lost,f} - A_{lost,d} = 5.94 - 0 - 0.565 = 5.38\ cm^2$

$$Q_a = \frac{A_{\text{eff}}}{A} = \frac{5.38}{5.94} = 0.905$$

$$Q = Q_s \times Q_a = 0.905$$

Allowable compression stress:

$$C_e = \sqrt{\frac{2\pi^2 E}{F_y}} = \sqrt{\frac{2\pi^2 \times 203{,}404}{350}} = 107.1$$

$$\frac{C_e}{\sqrt{Q}} = \frac{106.6}{\sqrt{1.0}} = 107.1 < KL/r = \frac{1.0(200)}{2.15} = 92.95$$

Allowable compression stress for members braced against twisting (Ref Cl. 6.6.1.1):

$$F_{a1} = \frac{12}{23}QF_y - \frac{3(QF_y)^2}{23\pi^2 E}\left(\frac{KL}{r}\right)^2 = \frac{12}{23} \times 0.905 \times 3{,}569 - \frac{3(0.905 \times 3{,}569)^2}{23\pi^2(2{,}074{,}000)}(92.95)^2 = 1{,}111 \text{ kgf/cm}^2 = 108.9$$

Maximum allowable compressive stress for flexural torsional buckling (Ref Cl.6.6.1.2). The section is symmetric, so the distance between the geometric and shear center, $x_0 = 0$.

$$r_0 = \sqrt{r_x{}^2 + r_x{}^2 + x_0{}^2} = \sqrt{(4.77)^2 + (2.15)^2 + (0)^2} = 5.23 \text{ cm}$$

$$\sigma_x = \frac{\pi^2 E}{(KL\ / r)_x{}^2} = \frac{\pi^2(203{,}400)}{(41.95)^2} = 274.8 \text{ MPa}$$

$$\beta = 1 - (x_0 / r_0)^2 = 1.0$$

$$\sigma_t = \frac{1}{A \times r_0{}^2} \times \frac{GJ + \pi^2 EC_w}{(KL\ )^2} = \frac{1}{(594) \times (52.3)^2} \times \frac{77{,}968(1{,}260) + \pi^2(203{,}400)(834 \times 10^6)}{(2{,}000)^2} = 318.2 \text{ MPa}$$

$$\sigma_{TF0} = \frac{1}{2\beta}\left[\left(\sigma_{ex} + \sigma_t\right) - \sqrt{(\sigma_{ex} + \sigma_t)^2 - 4\beta\sigma_{ex}\sigma_t}\right]$$

$$= \frac{1}{2}\left[\left(274.8 + 318.2\right) - \sqrt{(274.8 + 318.2)^2 - 4(274.8 \times 318.2)}\right] = 274.8 \text{ MPa}$$

$$> 0.5 \times Q \times F_y = 0.5 \times 0.905 \times 350 = 158.4 \text{ MPa}$$

$$F_{a2} = 0.522 \times Q \times F_y - \frac{(Q \times F_y)^2}{7.67 \times \sigma_{TF0}} = 165.3 - \frac{(0.905 \times 350)^2}{7.67 \times 274.8} = 118.3 \text{ MPa}$$

Therefore, the allowable compressive stress:

$$F_c = \min \left| \begin{array}{l} F_{a1} = 108.9 \text{ MPa} \\ F_{a2} = 118.3 \text{ MPa} \end{array} \right.$$

Stress ratio in compression: *42.1 / 108.9 = 0.387*

<u>Bending Stress</u>

Actual bending stress:

$$f_b = \frac{M}{Z_{xx}} = \frac{2.71 \times 10^3}{21.60} = 125.5 \text{ MPa}$$

Per Cl. 6.8, the maximum allowable stress on the extreme fiber: $F_c = 0.6 \times F_y = 210 \text{ MPa}$

Per Cl. 6.3(b) , the allowable bending stress for laterally unbraced beams:

$$C_b = 1.0$$

$$\frac{L^2 S_{sc}}{d \times I_{yc}} = \frac{(2{,}000)^2(21.6 \times 10^3)}{125(15.14 \times 10^4)} = 4{,}565$$

$$\frac{0.18\pi^2 E \times C_b}{F_y} = \frac{0.18\pi^2(203{,}400)1.0}{350} = 1{,}032$$

$$\frac{0.9\pi^2 E \times C_b}{F_y} = \frac{0.9\pi^2(203{,}400)1.0}{350} = 5{,}162$$

Since $\frac{0.18\pi^2 E \times C_b}{F_y} < \frac{L^2 S_{sc}}{d \times I_{yc}} < \frac{0.9\pi^2 E \times C_b}{F_y}$,

$$F_b = \frac{2}{3}\pi^2 E \times C_b \frac{d \times I_{\mathrm{yc}}}{L^2 S_{\mathrm{xc}}} = 130.1 \text{ MPa}$$

Stress ratio in bending: *125.5 / 130.1 = 0.963*

Shear Stress

Shear area:

$$A_z = 2Bt = 2.295 \text{ cm}^2$$

$$A_y = t\left[\left(D - 2t\right) + 2\left(\mathrm{c} - t\right)\right] = 3.947 \text{ cm}^2$$

Clear distance between flanges, $h = d - 2t = 12.5 - 2\times 0.255 = 11.99\ cm$

$$\frac{h}{t} = \frac{11.99}{0.255} = 47.02 < \frac{4{,}590}{\sqrt{F_y}} = 99.20$$

$$F_v = \min \left| \begin{array}{l} \frac{1{,}275\sqrt{F_y}}{h\ /t} = \frac{1{,}275\sqrt{3{,}600}}{47.02} = 1{,}627 \text{ kgf/cm}^2 = 159.6 \text{ MPa} \\ 0.4F_y = 0.4 \text{ x } 350 = 140 \text{ MPa} \end{array} \right.$$

Actual shear stress:

$$f_v = \frac{V_y}{A_z} = \frac{6.85(10)}{3.947} = 17.36 \text{ MPa}$$

Stress ratio in shear: *17.36 / 140 = 0.124*

Bending in Web Stress

The actual bending stress in the web is calculated by interpolating from the bending stress diagram:

$$f_{\mathrm{bw}} = f_b\left(1 - \frac{t}{0.5d}\right) = 125.5\left(1 - \frac{0.255}{0.5 \times 12.5}\right) = 120.4 \text{ MPa}$$

The allowable bending stress in the web:

$$F_{\mathrm{bw}} = \frac{36{,}560{,}000}{\left(h/t\right)^2} = 16{,}536 \text{ kgf/cm}^2 = 1622 \text{ MPa} > 0.6F_y = 211.9 \text{ MPa} \qquad (6.4.2)$$

Stress ratio in web bending: *120.4 / 211.9 = 0.568*

Combined Bending and Shear Stress in Web

Per Cl. 6.4.3, use $F_{bw} = \frac{36{,}560{,}000}{\left(h/t\right)^2} = 16{,}536\ kgf / cm^2 = 1622\ MPa$ and $F_v = 159.6\ MPa$

Stress ratio in combined web bending and shear: $\sqrt{\left(\frac{f_{bw}}{F_{bw}}\right)^2 + \left(\frac{f_v}{F_{vc}}\right)^2} = \sqrt{\left(\frac{120.3}{1{,}622}\right)^2 + \left(\frac{17.35}{159.6}\right)^2} = 0.132$

Results

Table 679: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Allowable compression stress (MPa)	108.9	109.052	negligible

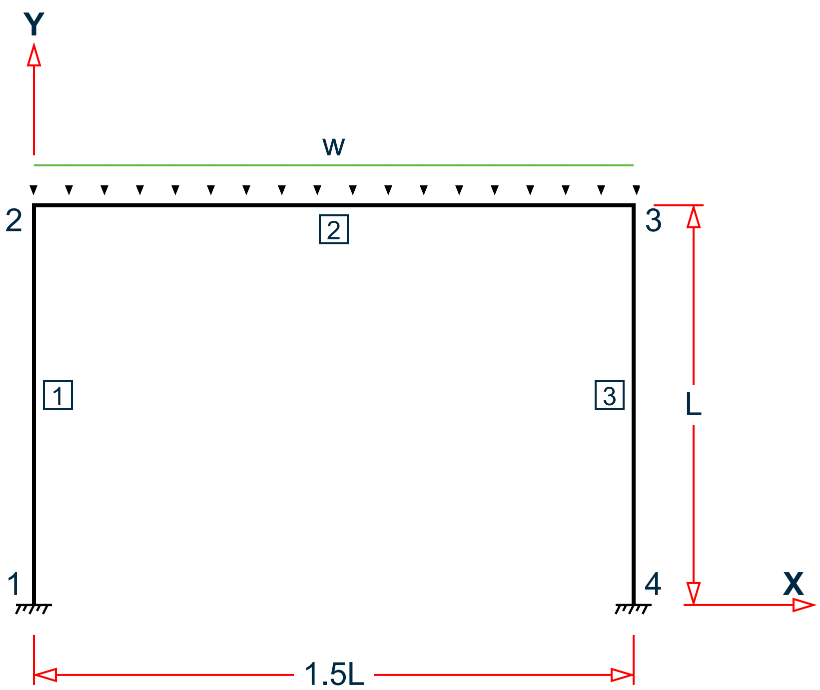
V. Japan

V.AIJ 2002 Check for MBG parameter

Verify the effect of the `MBG` parameter of the AIJ 2002 code on a doubly symmetric I shaped beam of span 6m, that is subjected to UDL of -20 KN/m on its span.

Details

Japanese H Shape Doubly Symmetric I Section H400X200X12X22 used in the following frame, E = 205,000 MPa, F_y = 235 MPa



where w = -20 kN/m and L = 4 m

Equation SSB-1.10 of JSME is used to evaluate Young's modulus, E, for equation 5.8 (`YNG 1`).

d = 400 mm, b_f = 200 mm, t_w = 12 mm, t_f = 22 mm

Verification

Maximum Moment, $MZ1 = 43.714\ kN{\cdot}m$

Minimum Moment, $MZ2 = 43.714\ kN{\cdot}m$

Span Moment = $46.286\ kN{\cdot}m$

Unbraced length of compression flange, $l_b = 6{,}000\ mm$

Note: Only the flanges will be considered (i.e., the web is ignored for calculating the section modulus). (`MBG 1`)

Area of compression flange = $A_f = b_f \times t_f = 4{,}400\ mm^2$

$$C_g = \frac{b_f \times t_f \times \left(d - \frac{t_f}{2}\right) + b_f \times t_f \times \frac{t_f}{2}}{\left(b_f \times t_f\right) + \left(b_f \times t_f\right)} = 200\ mm$$

$$I_{zz} = 2 \times \left(b_f \times \frac{t_f{}^3}{12}\right) + 2 \times b_f \times t_f \times \left(c_g - \frac{t_f}{2}\right)^2 = 3.147 \times (10)^8\ mm^4$$

Elastic Section Modulus about Z axis on compression side $Z_{zc} = I_{zz}/c_g = 1.573{\times}10^6\ mm^3$

$I_{yc} = t_f{\times}b_f^3/12 = 1.467{\times}107\ mm^4$

$A_C = t_f{\times}b_f = 4{,}400\ mm^2$

$r_i = \sqrt{(I_{yc}/A_C)} = 57.735\ mm$

Bending Moment Factor C = 1.75 – 1.05×(-MZ2/MZ1) + 0.3×(-MZ2/MZ1)2 = 3.198, but not more than 2.3

As Span moment > MZ1, C will be 1

Allowable slenderness ratio $\Lambda = \sqrt{\frac{\pi^2 * E}{0.6 * FYLD}} = 119.789$

$$f_{b1} = 1.5 \times \left[1 - 0.4 \times \frac{\left(\frac{l_b}{r_i}\right)^2}{C \times \Lambda^2} \right] \times \frac{f_t}{\Upsilon} = 109.501\ N/mm^2$$

As per Eq. SSB-1.10 for YNG = 1:

$$f_{b2} = 1.5 \times \frac{0.433 \times E}{\frac{l_b \times d}{A_f} \times \Upsilon} = 162.736\ N/mm^2$$

$$f_{bz1} = \max(f_{b1}, f_{b2}) = 162.736\ \text{N/mm}^2$$

Allowable tensile bending stress, $f_{bzt} = f_t = 156.67\ N/mm^2$

Actual tensile bending stress about Z axis = $46.286/Z_{ZC} = 29.43\ N/mm^2$

Utilization ratio = Actual bending stress/Allowable bending stress = $29.43/156.67 = 0.188$

Allowable compressive bending stress, $f_{bzc} = min(f_{bz1}, f_t) = 156.67\ N/mm^2$

Actual compressive bending stress about Z axis = $46.286/Z_{ZC} = 29.43\ N/mm^2$

Utilization ratio = Actual bending stress/Allowable bending stress = $29.43/156.67 = 0.188$

Results

Table 680: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Actual bending tensile stress (N/mm^2)	29.43	29.42	negligible

V.AIJ 2002 Check for MISES parameter

Verify the von Mises stress calculations per the AIJ 2002 code using a cantilever beam.

Details

Japanese Angle section L250X250X35, E = 205,000 MPa, F_y = 200 MPa

The member is a 5 m cantilever with the following applied loads at the end:

Fx = 10 kN
Vz = 5 kN
Vy = 5 kN
T = 5 kN·m

Verification

The maximum of the left-hand side of the von Mises stress equation apparently occurs at the fixed support of the beam. Section forces at the fixed end are calculated as below.

FX = -10 KN
FY = -5 KN
FZ = -5 KN
MX = -5 KN-m
MY = 25 KN-m
MZ = -25 KN-m

The standard AIJ calculation is used (`MISES 1`). From these section forces, σ_x and τ_{xy} at the section of the fixed end are calculated:

$$\sigma_x = \left|\frac{F_x}{A_x}\right| + \left|\frac{M_y}{Z_y}\right| + \left|\frac{M_z}{Z_z}\right|$$

$$= \left|\frac{-10{,}000}{16{,}260}\right| + \left|\frac{25{,}000{,}000}{838{,}660}\right| + \left|\frac{-25{,}000{,}000}{355{,}900}\right|$$

$$=0.615 + 29.809 + 70.244 = 100.668 \text{ N/mm}^2$$

$$\tau_{xy} = \left|\frac{Mx}{Zx}\right| + \sqrt{\left|\frac{Fy}{Ay}\right|^2 + \left|\frac{Fz}{Az}\right|^2}$$

$$= \left|\frac{5{,}000{,}000}{189{,}700}\right| + \sqrt{\left|\frac{5{,}000}{5{,}833}\right|^2 + \left|\frac{5{,}000}{5{,}833}\right|^2}$$

$$= 27.57 \text{ N/mm}^2$$

From σ_x and τ_{xy} , f_m is calculated:

$$f_m = \sqrt{\sigma_x^2 + 3\tau_{xy}^2} = 111.42 \ N / mm^2$$

For permanent loading, $k = 1$ and $f_t = f_y / 1.5 = 133.33 \ N/mm^2$

Therefore, the ratio = $f_m / k \times f_t = 111.419/(1 \times 133.33) = 0.836$

Results

Table 681: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
f_m (N/mm^2)	111.42	111.42	none	
f_t (N/mm^2)	133.33	133.33	none	
σ_x (N/mm^2)	100.668	100.669	negligible	
τ_{xy} (N/mm^2)	27.569	27.57	negligible	
Ratio	0.836	0.836	none

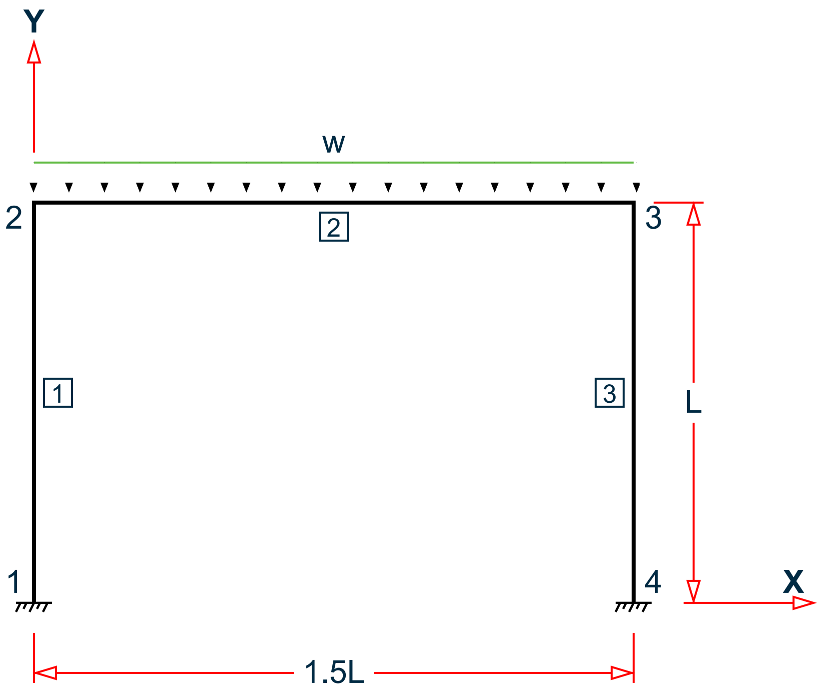
V.AIJ 2005 Check for MBG parameter

Verify the effect of the `MBG` parameter of the AIJ 2005 code on a doubly symmetric I shaped beam of span 6m, that is subjected to UDL of -20 KN/m on its span.

Details

Japanese H Shape Doubly Symmetric I Section H400X200X12X22 used in the following frame, E = 205,000 MPa, F_y = 235 MPa



where w = -20 kN/m and L = 4 m

Equation SSB-1.10 of JSME is used to evaluate Young's modulus, E, for equation 5.8 (`YNG 1`).

d = 400 mm, b_f = 200 mm, t_w = 12 mm, t_f = 22 mm

Verification

Maximum Moment, $MZ1 = 43.714\ kN{\cdot}m$

Minimum Moment, $MZ2 = 43.714\ kN{\cdot}m$

Span Moment = $46.286\ kN{\cdot}m$

Unbraced length of compression flange, $l_b = 6{,}000\ mm$

Note: Only the flanges will be considered (i.e., the web is ignored for calculating the section modulus). (`MBG 1`)

Area of compression flange = $A_f = b_f \times t_f = 4{,}400\ mm^2$

$$C_g = \frac{b_f \times t_f \times \left(d - \frac{t_f}{2}\right) + b_f \times t_f \times \frac{t_f}{2}}{\left(b_f \times t_f\right) + \left(b_f \times t_f\right)} = 200\ mm$$

$$I_{zz} = 2 \times \left(b_f \times \frac{t_f{}^3}{12}\right) + 2 \times b_f \times t_f \times \left(c_g - \frac{t_f}{2}\right)^2 = 3.147 \times (10)^8\ mm^4$$

Elastic Section Modulus about Z axis on compression side $Z_{zc} = I_{zz}/c_g = 1.573{\times}10^6\ mm^3$

$$I_{yc} = t_f{\times}b_f{}^3/12 = 1.467{\times}107\ mm^4$$

$$A_C = t_f{\times}b_f = 4{,}400\ mm^2$$

$$r_i = \sqrt{(I_{yc}/A_C)} = 57.735\ mm$$

Bending Moment Factor C = 1.75 – 1.05×(-MZ2/MZ1) + 0.3×(-MZ2/MZ1)2 = 3.198, but not more than 2.3

As Span moment > MZ1, C will be 1. (Eq. 5.15)

Elastic critical slenderness ratio ${}_e\lambda_b = 1/\sqrt{0.6} = 1.291$ (Eq. 5.11)

Plastic slenderness ratio = ${}_p\lambda_b = 0.3$ (Eq. 5.14)

$$M_y = f_y \times Z_Z = 427.7 \text{ k}\cdot\text{m}$$

$M_e = 558.21\ kN\cdot m$
(Eq. 5.16)

So, $\lambda_b = \sqrt{(M_y/M_e)} = 0.8753$ (Eq. 5.10)

So, here ${}_p\lambda_b < \lambda_b < {}_e\lambda_b$

So, we calculate Allowable bending stress as per Eq. 5.8

$$v = 3/2 + 2/3\times(\lambda_b/{}_e\lambda_b)^2 = 1.8065$$

$$f_b = \frac{\left[1 - 0.4 \times \frac{\lambda_b - {}_p\lambda_b}{{}_e\lambda_b - {}_p\lambda_b}\right] \times f_y}{v} = 99.88\ N/mm^2$$

Allowable tensile bending stress, $f_{bzt} = f_t = 156.667\ N/mm^2$

Actual tensile bending stress about Z axis = $46.286/ZZC = 29.425\ N/mm^2$

Utilization ratio = Actual bending stress/Allowable bending stress = $29.425/156.667 = 0.1878$

Allowable compressive bending stress $f_{bzc} = min(f_b, f_t) = 99.88\ N/mm^2$

Actual compressive bending stress about Z axis = $46.286/ZZC = 29.425\ N/mm^2$

Utilization ratio = Actual bending stress/Allowable bending stress = $29.425/99.88 = 0.295$

Results

Table 682: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Actual bending tensile stress (N/mm^2)	29.425	29.42	Negligible	
Allowable bending tensile stress (N/mm^2)	156.667	156.67	Negligible	
Ratio	0.1878	0.188	Negligible	
My (kN·m)	427.7	427.7	None	
Me (kN·m)	558.21	558.21	None	

Result Type	Reference	STAAD.Pro	Difference	Comments
${}_{p}\lambda_{b}$	0.3	0.3	None	
C	1	1	None	
Actual bending compressive stress (N/mm^2)	29.425	29.42	Negligible	
Allowable bending compressive stress (N/mm^2)	99.88	99.88	None	
Ratio	0.295	0.295	None

V.AIJ 2005 Check for MISES parameter

Verify the Von Mises stresses per the AIJ 2005 code of a beam in a frame.

Details

A cantilever beam is subject to the following forces at the free end. The cantilever member is a pair of C12X30, back-to-back.

$F_x = 5$ kN

$F_y = -15$ kN

$F_z = 5$ kN

$M_x = 10$ kN·m

$M_y = -6.667$ kN·m

The member is steel with the following material properties:

E = 205,000 MPa

$F_y = 200$ MPa

The section forces at the fixed-end of the left cantilever are taken from the STAAD.Pro analysis:

$F_x = -5$ kN

$F_y = -15$ kN

$F_z = -5$ kN

$M_x = -10$ kN·m

$M_y = 15$ kN·m

$M_z = 25$ kN·m

Validation

From the section forces, σ_x and τ_{xy} at the cross-section at the fixed end are calculated:

$$\sigma_x = \left| \frac{F_x}{A_x} \right| + \left| \frac{M_y}{Z_y} \right| + \left| \frac{M_z}{Z_z} \right| = \left| \frac{\text{-5,000}}{11{,}368} \right| + \left| \frac{1{,}5000{,}000}{425{,}030} \right| + \left| \frac{25{,}000{,}000}{884{,}900} \right|$$

$$= 0.440 + 35.292 + 28.25 = 63.98 \ \ \text{N/mm}^2$$

$$\tau_{xy} = \left| \frac{Mx}{Zx} \right| + \sqrt{\left| \frac{Fy}{Ay} \right|^2 + \left| \frac{Fz}{Az} \right|^2} = \frac{10{,}000{,}000}{51{,}605} + \sqrt{\left(\frac{15{,}000}{7{,}897}\right)^2 + \left(\frac{5{,}000}{2{,}732}\right)^2} = 196.4 \ \ \text{N/mm}^2$$

From these, the Von Mises stress, f_m, is calculated as:

$$f_m = \sqrt{\sigma_x^2 + 3\tau_{xy}^2} = \sqrt{(63.98)^2 + 3(196.5)^2} = 346.17 \ \ \text{N/mm}^2$$

For permanent loading conditions, $k = 1$ and $f_t = F_y/1.5 = 133.3\ N/mm^2$

The ratio = $f_m\ /\ (k \times f_t\ ) = 346.17\ /\ (1 \times 133.3) = 2.596$

Results

Table 683: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
σ_x (N/mm^2)	63.98	63.983	negligible	
τ_{xy} (N/mm^2)	196.4	196.415	negligible	
f_m (N/mm^2)	346.17	346.16	negligible	
f_t (N/mm^2)	133.3	133.3	negligible	
Ratio	2.596	2.596	none

- *D9.B.4 Von Mises Stresses Check* (on page 1727)

V.AIJ 2005 Check for MISES parameter 2

A slender, cantilever beam subjected to a load at the end.

Given

A cantilever beam of length 0.3 meters is subjected to a permanent joint load of 3 kN in the Y direction and 2 kN in the Z direction as well as a 0.008 kN·m torque applied at the end. Axial tension of 10 kN is also applied to the member. An H100x50x5 section is used from the Japanese steel tables.

Section properties

$D = 100$ mm, $B = 50$ mm, $t_f = 7$ mm, $t_w = 5$ mm
$I_x = 15{,}000$ mm^4
$A_x = 1185$ mm^2, $A_y = 500$ mm^2, $A_z = 467$ mm^2
$Z_x = I_x/t_{max} = 15{,}000/7 = 2{,}143$ mm^3, $Z_y = 5{,}920$ mm^3, $Z_z = 37{,}400$ mm^3

The maximum of the left hand side of the von Mises stress equation apparently occurs at the fixed end of the beam. Section forces at the fixed end are as follows:

-10.0 kN (Tension)
0.6 kN·m (Bending-Y)
0.9 kN·m (Bending-Z)
-3.0 kN (Shear-Y)

-2.0 kN (Shear-Z)
-0.008 kN·m (Torsion

Material

FYLD = 300 MPa
E = 2.05E+05 MPa
G = E/2.6 MPa

Solution

From these section forces, σ_x and τ_{xy} at the section of the fixed end are calculated as follows:

$$\sigma_x = \left| \frac{F_x}{A_x} \right| + \left| \frac{M_y}{Z_y} \right| + \left| \frac{M_z}{Z_z} \right|$$
$$= \left| \frac{-10,000}{1,185} \right| + \left| \frac{600,000}{5,920} \right| + \left| \frac{-900,000}{37,400} \right| = 8.44 + 101.35 + 24.06 = 133.85 \; N/mm^2$$

$$\tau_{xy} = \left| \frac{M_x}{Z_x} \right| + \sqrt{\left| \frac{F_y}{A_y} \right|^2 + \left| \frac{F_z}{A_z} \right|^2}$$
$$= \left| \frac{-8,000}{2,143} \right| + \sqrt{\left| \frac{-3,000}{500} \right|^2 + \left| \frac{-2,000}{467} \right|^2} = 3.73 + \sqrt{6^2 + 4.28^2} = 11.10 \; N/mm^2$$

From σ_x and τ_{xy}, f_m is calculated:

$$f_m = \sqrt{\sigma_x^2 + 3\tau_{xy}^2} = \sqrt{(133.85)^2 + 3(11.10)^2} = 135.22 N / mm^2$$

Since $f_t = FYLD/1.5 = 300.0\ MPa/15 = 200.0\ N/mm^2$ and k = 1 for permanent loading,

Ratio = $135.22/(200.0 \cdot 1) = 0.676 < 1$, So OK.

Comparison

Table 684: Comparison of results

	Hand Calculation	STAAD.Pro Result	Comments
von Mises Stress, f_m (N/mm^2)	135.22	135.21	negligible

V.AIJ 2005 UPT Channel

Verify the bending capacity and compression capacity of a channel section beam.

Details

The member is a 5 m long simply-supported beam. The section used is a C380X100X10.5. The steel has a yield strength of 235 MPa, a modulus of elasticity of $205\times(10)^3$ MPa, and a shear modulus of $79\times(10)^3$ MPa.

The member is subject to the following loads:

a 10 kN·m concentrated moment at the left end
a -3 kN·m concentrated moment at the right end

Validation

Section Properties

Dimensions:

Depth, $D = 380\ mm$
Width, $B = 100\ mm$
Thickness of web, $t_w = 10.5\ mm$
Thickness of flange, $t_f = 16\ mm$

Height of web, $d = D - 2t_f = 348\ mm$

Area, $A_x = 2B \times t_f + d \times t_w = 6{,}854\ mm^2$

Distance from heel to centroid, $c_z = \dfrac{t_f B^2 + \frac{1}{2} t_w{}^2 d}{A} = \dfrac{16(100)^2 + \frac{1}{2}(10.5)^2(348)}{6{,}854} = 26.14\ mm$

Moment of inertia about major axis, $I_z = \dfrac{d^3 t_w}{12} + 2\left[\dfrac{t_f{}^3 B}{12} + t_f B\left(\dfrac{t_f}{2} + \dfrac{d}{2}\right)^2\right] = 142.9(10)^6\ mm^4$

Moment of inertia about minor axis, $I_y = \dfrac{t_w{}^3 d}{12} + t_w d\left(c_z - \dfrac{t_w}{2}\right)^2 + 2\left[\dfrac{t_f B^3}{12} + t_f B\left(\dfrac{B}{2} - c_z\right)^2\right] = 6.117(10)^6\ mm^4$

Major axis section modulus, $Z_z = \dfrac{I_z}{D/2} = 752.3(10)^3\ mm^3$

Minor axis section modulus, $Z_y = \dfrac{I_y}{B - c_z} = 82.82(10)^3\ mm^3$

Torsional constant, $J = \frac{1}{3}\left(d t_w{}^3 + 2B t_f{}^3\right) = 407.4(10)^3\ mm^4$

Warping constant, $C_W = 144.3(10)^9\ mm^6$

Radius of gyration about major axis, $r_z = \sqrt{I_z / A} = 144.4\ mm$

Radius of gyration about minor axis, $r_y = \sqrt{I_y / A} = 29.87\ mm$

Section Classification

For webs of beams (Cl. 8.5):

$$\frac{d}{t_w} = 33.14 < 2.4\sqrt{\frac{E}{F}} = 2.4\sqrt{\frac{205{,}000}{235}} = 70.89$$

Depth to thickness ratio is “OK”.

Allowable Compressive Stress

The slenderness ratio of compression members (Cl. 11.1):

$$\lambda = \frac{K_y \times L_y}{r_y} = \frac{1 \times 5{,}000}{29.87} = 167.4$$

Slenderness ratio dividing elastic and inelastic buckling (Cl no 5.5):

$$\Lambda = \sqrt{\frac{\pi^2 \times E}{0.6 \times F}} = \sqrt{\frac{\pi^2 \times 205{,}000}{0.6 \times 235}} = 119.8$$

$$v = \frac{3}{2} + \frac{2}{3} \times \left(\frac{\lambda}{\Lambda}\right)^2 = \frac{3}{2} + \frac{2}{3} \times \left(\frac{167.4}{119.8}\right)^2 = 2.802$$

$\lambda > \Lambda$, so the allowable compressive stress is given by Cl. 5.4:

$$f_c = \frac{0.277 \times F}{\left(\frac{\lambda}{\Lambda}\right)^2} = \frac{0.277 \times 235}{\left(\frac{167.4}{119.8}\right)^2} = 33.35 \text{ MPa}$$

Allowable Flexural Stress

Distance between braced points of the compression flange, $l_b = 5{,}000\ mm$.

The yield moment, $M_y = F \times Z_z = \frac{235 \times 752.3(10)^3}{10^6} = 176.8\ kN{\cdot}m$

The modification factor for allowable flexural stress (Cl. 5.13):

$$C = 1.75 - 1.05 \times \left(\frac{M_2}{M_1}\right) + 0.3 \times \left(\frac{M_2}{M_1}\right)^2 = 1.75 - 1.05 \times \left(\frac{3}{10}\right) + 0.3 \times \left(\frac{3}{10}\right)^2 = 1.462$$

The elastic lateral-torsional buckling moment (Cl 5.12):

$$M_e = C \times \sqrt{\frac{\pi^4 \times E \times I_y \times E \times I_w}{{l_b}^4} + \frac{\pi^2 \times E \times I_y \times G \times J}{{l_b}^2}}$$

$$\frac{\pi^4 \times E \times I_y \times E \times I_w}{{l_b}^4} = \frac{\pi^4 \times 205{,}000 \times 6.117 \times 10^6 \times 205{,}000 \times 144.3 \times 10^9}{5{,}000^4} = 5.791 \times 10^{15}$$

$$\frac{\pi^2 \times E \times I_y \times G \times J}{{l_b}^2} = \frac{\pi^2 \times 205{,}000 \times 6.117 \times 10^6 \times 79{,}000 \times 407.4 \times 10^3}{5{,}000^2} = 15.93 \times 10^{15}$$

$$= 1.462 \times \sqrt{5.791 \times 10^{15} + 15.93 \times 10^{15}} = 215.4 \text{ kN·m}$$

The maximum slenderness ratio to achieve the plastic strength (Cl. 5.12):

$$p\lambda_b = 0.6 + 0.3 \times \left(\frac{-M_2}{M_1}\right) = 0.6 + 0.3 \times \left(\frac{-3}{10}\right) = 0.51$$

The elastic slenderness limit:

$$e\lambda_b = \frac{1}{\sqrt{0.6}} = 1.291$$

Slenderness ratio of the flexural member, $\lambda_b = \sqrt{\frac{M_y}{M_e}} = 0.906$

Here, $p\lambda_b < \lambda_b \leq e\lambda_b$, so:

$$\nu = \frac{3}{2} + \frac{2}{3} \times \left(\frac{\lambda_b}{e\lambda_b}\right)^2 = \frac{3}{2} + \frac{2}{3} \times \left(\frac{0.483}{1.291}\right)^2 = 1.828$$

$$f_b = \frac{\left(1 - 0.4 \times \frac{\lambda_b - p\lambda_b}{e\lambda_b - p\lambda_b}\right) \times F}{\nu} = \frac{\left(1 - 0.4 \times \frac{0.906 - 0.3}{1.291 - 0.3}\right) \times 235}{1.828} = 102.5 \text{ MPa}$$

Results

Table 685:

Result Type	Reference	STAAD.Pro	Difference	Comments
Allowable compressive stress (MPa)	33.35	33.34	negligible	
Allowable flexural stress (MPa)	102.5	102.48	negligible

- *D9.B.2 Member Capacities* (on page 1720)

V.AIJ 2005 UPT Double Angle

Verify the bending capacity and compression capacity of a double angle section beam.

Details

The member is a 5 m long simply-supported beam. The section used is a 2x L100x100x13, with no spacing. The steel has a yield strength of 235 MPa, a modulus of elasticity of $205 \times (10)^3$ MPa, and a shear modulus of $79 \times (10)^3$ MPa.

The member is subject to the following loads:

a -5 kN concentrated force at mid-span in the global Y direction
a 3 kN concentrated force at mid-span in the global Z direction
a -40 kN axial force
a -0.2 kN·m concentrated moment at the left end

Validation

<u>Section Properties</u>

Dimensions:

Leg, $D = 100\ mm$
Width, $B = 200\ mm$
Thickness, $t = 13\ mm$

Outstanding leg length, $d = D - t = 87\ mm$

Area, $A_x = B \times t + 2d \times t = 4{,}862\ mm^2$

Distance from heel to centroid, $c_y = \dfrac{\frac{1}{2} B t^2 + 2dt\left(t + \frac{d}{2}\right)}{A} = \dfrac{\frac{1}{2} 200(13)^2 + 2\left(87\right)\left(13\right)\left(13 + \frac{87}{2}\right)}{4{,}862} = 29.76\ mm$

Moment of inertia about major axis, $I_z = \dfrac{Bt^3}{12} + Bt\left(c_y - \frac{t}{2}\right) + 2\left[\dfrac{td^3}{12} + td\left(t + \frac{d}{2} - c_y\right)^2\right] = 4.487(10)^6\ mm^4$

Moment of inertia about minor axis, $I_y = \dfrac{tB^3}{12} + \frac{2}{3} d t^3 = 8.676(10)^6\ mm^4$

Major axis section modulus, $Z_z = \frac{I_z}{D - c_y} = 63.81(10)^3\ mm^3$

Minor axis section modulus, $Z_y = \frac{I_y}{D} = 86.76(10)^3\ mm^3$

Torsional constant, $J = 273.9(10)^3\ mm^4$

Warping constant, $C_W = 199.5(10)^9\ mm^6$

Radius of gyration about major axis, $r_z = \sqrt{I_z/A} = 30.38\ mm$

Radius of gyration about minor axis, $r_y = \sqrt{I_y/A} = 42.53\ mm$

<u>Section Classification</u>

For webs of beams (Cl. 8.1):

$$\frac{d}{t_w} = 7.69 < 0.44\sqrt{\frac{E}{F}} = 0.44\sqrt{\frac{205{,}000}{235}} = 13.0$$

Depth to thickness ratio is “OK”.

<u>Allowable Compressive Stress</u>

The slenderness ratio of compression members (Cl. 11.1):

$$\lambda_z = \frac{K_z \times L_z}{r_z} = \frac{1 \times 5{,}000}{30.38} = 164.6$$

$$\lambda_y = \frac{K_y \times L_y}{r_y} = \frac{1 \times 5{,}000}{42.53} = 117.6$$

Therefore, $\lambda = 164.6$.

Slenderness ratio dividing elastic and inelastic buckling (Cl no 5.5):

$$\Lambda = \sqrt{\frac{\pi^2 \times E}{0.6 \times F}} = \sqrt{\frac{\pi^2 \times 205{,}000}{0.6 \times 235}} = 119.8$$

$$\text{v} = \frac{3}{2} + \frac{2}{3} \times \left(\frac{\lambda}{\Lambda}\right)^2 = \frac{3}{2} + \frac{2}{3} \times \left(\frac{164.6}{119.8}\right)^2 = 2.758$$

$\lambda > \Lambda$, so the allowable compressive stress is given by Cl. 5.4:

$$f_c = \frac{0.277 \times F}{\left(\frac{\lambda}{\Lambda}\right)^2} = \frac{0.277 \times 235}{\left(\frac{164.6}{119.8}\right)^2} = 34.49\ \text{MPa}$$

<u>Allowable Flexural Stress</u>

Distance between braced points of the compression flange, $l_b = 5{,}000\ mm$.

The yield moment, $M_y = F \times Z_z = \frac{235 \times 87.94(10)^3}{10^6} = 20.67\ kN \cdot m$

The modification factor for allowable flexural stress (Cl. 5.13):

$$C = 1$$

The elastic lateral-torsional buckling moment (Cl 5.12):

$$M_e = C \times \sqrt{\frac{\pi^4 \times E \times I_{zz} \times E \times I_w}{l_b^4} + \frac{\pi^2 \times E \times I_{zz} \times G \times J}{l_b^2}}$$

$$\frac{\pi^4 \times E \times I_y \times E \times I_w}{l_b^4} = \frac{\pi^4 \times 205{,}000 \times 4.847 \times 10^6 \times 205{,}000 \times 199.5 \times 10^6}{5{,}000^4} = 6.333 \times 10^{12}$$

$$\frac{\pi^2 \times E \times I_y \times G \times J}{l_b^2} = \frac{\pi^2 \times 205{,}000 \times 4.847 \times 10^6 \times 79{,}000 \times 273.9 \times 10^3}{5{,}000^2} = 8.488 \times 10^{15}$$

$$= 1.0 \times \sqrt{6.333 \times 10^{12} + 8.488 \times 10^{15}} = 88.59 \text{ kN·m}$$

The maximum slenderness ratio to achieve the plastic strength (Cl. 5.12):

$$p\lambda_b = 0.3$$

The elastic slenderness limit:

$$e\lambda_b = \frac{1}{\sqrt{0.6}} = 1.291$$

Slenderness ratio of the flexural member, $\lambda_b = \sqrt{\frac{M_y}{M_e}} = 0.483$

Here, $p\lambda_b < \lambda_b \leq e\lambda_b$, so:

$$\nu = \frac{3}{2} + \frac{2}{3} \times \left(\frac{\lambda_b}{e\lambda_b}\right)^2 = \frac{3}{2} + \frac{2}{3} \times \left(\frac{0.483}{1.291}\right)^2 = 1.593$$

$$f_b = \frac{\left(1 - 0.4 \times \frac{\lambda_b - p\lambda_b}{e\lambda_b - p\lambda_b}\right) \times F}{\nu} = \frac{\left(1 - 0.4 \times \frac{0.483 - 0.3}{1.291 - 0.3}\right) \times 235}{1.593} = 136.6 \text{ MPa}$$

Results

Table 686:

Result Type	Reference	STAAD.Pro	Difference	Comments
Allowable compressive stress (MPa)	34.49	34.48	negligible	
Allowable flexural stress (MPa)	136.6	136.62	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\ Verification Models\09 Steel Design\Japan\AIJ 2005 UPT Double Angle.STD` is typically installed with the program.

- *D9.B.2 Member Capacities* (on page 1720)

V.AIJ 2005 UPT General

Verify the bending capacity and compression capacity of an H section beam.

Details

The member is a 5 m long simply-supported beam. The section used is an H300x150x6.5x9. The steel has a yield strength of 235 MPa, a modulus of elasticity of 205×(10)^3 MPa, and a shear modulus of 79×(10)^3 MPa.

The member is subject to the following loads:

a -10 kN concentrated force at mid-span in the global Y direction
a 3 kN concentrated force at mid-span in the global Z direction
a -40 kN axial force
a -0.2 kN·m concentrated moment at the left end

Validation

<u>Section Properties</u>

Dimensions:

Leg, $D = 300\ mm$
Width, $B = 150\ mm$
Thickness of web, $t_w = 6.5\ mm$
Thickness of flange, $t_f = 9\ mm$

Depth of web, $d = D - 2t_f = 282\ mm$

Area, $A_x = 4{,}678\ mm^2$

Moment of inertia about major axis, $I_z = 72.1(10)^6\ mm^4$

Moment of inertia about minor axis, $I_y = 0.508(10)^6\ mm^4$

Major axis section modulus, $Z_z = 480.7(10)^3\ mm^3$

Minor axis section modulus, $Z_y = 67.73(10)^3\ mm^3$

Torsional constant, $J = 99.5(10)^3\ mm^4$

Warping constant, $C_W = 107.5(10)^9\ mm^6$

Radius of gyration about major axis, $r_z = \sqrt{I_z / A} = 124.1\ mm$

Radius of gyration about minor axis, $r_y = \sqrt{I_y / A} = 32.95\ mm$

<u>Section Classification</u>

For webs of beams in compression (Cl. 8.1):

$$\frac{d}{t_w} = \frac{282}{8} = 43.39 < 1.6\sqrt{\frac{E}{F}} = 1.6\sqrt{\frac{205{,}000}{235}} = 47.26$$

Depth to thickness ratio is “OK”.

For webs of beams in bending (Cl. 8.1):

$$\frac{d}{t_w} = 43.39 < 2.4\sqrt{\frac{E}{F}} = 2.4\sqrt{\frac{205{,}000}{235}} = 70.89$$

Depth to thickness ratio is “OK”.

<u>Allowable Compressive Stress</u>

The slenderness ratio of compression members (Cl. 11.1):

$$\lambda_z = \frac{K_z \times L_z}{r_z} = \frac{1 \times 5{,}000}{124.1} = 40.27$$

$$\lambda_y = \frac{K_y \times L_y}{r_y} = \frac{1 \times 5{,}000}{32.95} = 151.7$$

Therefore, $\lambda = 151.7$.

Slenderness ratio dividing elastic and inelastic buckling (Cl no 5.5):

$$\Lambda = \sqrt{\frac{\pi^2 \times E}{0.6 \times F}} = \sqrt{\frac{\pi^2 \times 205{,}000}{0.6 \times 235}} = 119.8$$

$$\nu = \frac{3}{2} + \frac{2}{3} \times \left(\frac{\lambda}{\Lambda}\right)^2 = \frac{3}{2} + \frac{2}{3} \times \left(\frac{151.7}{119.8}\right)^2 = 2.570$$

$\lambda > \Lambda$, so the allowable compressive stress is given by Cl. 5.4:

$$f_c = \frac{0.277 \times F}{\left(\frac{\lambda}{\Lambda}\right)^2} = \frac{0.277 \times 235}{\left(\frac{151.7}{119.8}\right)^2} = 40.57 \text{ MPa}$$

<u>Allowable Flexural Stress</u>

Distance between braced points of the compression flange, $l_b = 5{,}000\ mm$.

The yield moment, $M_y = F \times Z_z = \frac{235 \times 480.7(10)^3}{10^6} = 113.0\ kN \cdot m$

The modification factor for allowable flexural stress (Cl. 5.13):

$$C = 1$$

The elastic lateral-torsional buckling moment (Cl 5.12):

$$M_e = C \times \sqrt{\frac{\pi^4 \times E \times I_y \times E \times I_w}{l_b^4} + \frac{\pi^2 \times E \times I_y \times G \times J}{l_b^2}}$$

$$\frac{\pi^4 \times E \times I_y \times E \times I_w}{l_b^4} = \frac{\pi^4 \times 205{,}000 \times 50.8 \times 10^6 \times 205{,}000 \times 107.5 \times 10^9}{5{,}000^4} = 35.77 \times 10^{15}$$

$$\frac{\pi^2 \times E \times I_y \times G \times J}{l_b^2} = \frac{\pi^2 \times 205{,}000 \times 50.8 \times 10^6 \times 79{,}000 \times 99.54 \times 10^3}{5{,}000^2} = 32.32 \times 10^{15}$$

$$= 1.0 \times \sqrt{35.77 \times 10^{15} + 32.32 \times 10^{15}} = 82.49 \text{ kN} \cdot \text{m}$$

The maximum slenderness ratio to achieve the plastic strength (Cl. 5.12):

$$p\lambda_b = 0.3$$

The elastic slenderness limit:

$$e\lambda_b = \frac{1}{\sqrt{0.6}} = 1.291$$

Slenderness ratio of the flexural member, $\lambda_b = \sqrt{\frac{M_y}{M_e}} = 1.17$

Here, $p\lambda_b < \lambda_b \le e\lambda_b$, so:

$$\nu = \frac{3}{2} + \frac{2}{3} \times \left(\frac{\lambda_b}{e\lambda_b}\right)^2 = \frac{3}{2} + \frac{2}{3} \times \left(\frac{1.17}{1.291}\right)^2 = 2.048$$

$$f_b = \frac{\left(1 - 0.4 \times \frac{\lambda_b - p\lambda_b}{e\lambda_b - p\lambda_b}\right) \times F}{\nu} = \frac{\left(1 - 0.4 \times \frac{1.17 - 0.3}{1.291 - 0.3}\right) \times 235}{2.048} = 74.45 \text{ MPa}$$

Results

Table 687:

Result Type	Reference	STAAD.Pro	Difference	Comments
Allowable compressive stress (MPa)	40.57	40.57	none	
Allowable flexural stress (MPa)	74.45	74.47	negligible

- *D9.B.2 Member Capacities* (on page 1720)

V.AIJ 2005 UPT I

Verify the bending capacity and compression capacity of an I section beam.

Details

The member is a 5 m long simply-supported beam. The section used is an I300X150X8. The steel has a yield strength of 235 MPa, a modulus of elasticity of $205\times(10)^3$ MPa, and a shear modulus of $79\times(10)^3$ MPa.

The member is subject to the following loads:

a -10 kN concentrated force at mid-span in the global Y direction
a 3 kN concentrated force at mid-span in the global Z direction
a -40 kN axial force
a -0.2 kN·m concentrated moment at the left end

Validation

<u>Section Properties</u>

Dimensions:

Leg, $D = 300\ mm$
Width, $B = 150\ mm$
Thickness of web, $t_w = 8\ mm$
Thickness of flange, $t_f = 13\ mm$

Depth of web, $d = D - 2t_f = 274\ mm$

Area, $A_x = 6{,}092\ mm^2$

Moment of inertia about major axis, $I_z = 94.08(10)^6\ mm^4$

Moment of inertia about minor axis, $I_y = 7.324(10)^6\ mm^4$

Major axis section modulus, $Z_z = 627.2(10)^3\ mm^3$

Minor axis section modulus, $Z_y = 97.66(10)^3\ mm^3$

Torsional constant, $J = 26.87(10)^3\ mm^4$

Warping constant, $C_W = 150.6(10)^9\ mm^6$

Radius of gyration about major axis, $r_z = \sqrt{I_z/A} = 124.3\ mm$

Radius of gyration about minor axis, $r_y = \sqrt{I_y/A} = 34.67\ mm$

<u>Section Classification</u>

For webs of beams in bending (Cl. 8.5):

$$\frac{d}{t_w} = \frac{274}{8} = 34.25 < 2.4\sqrt{\frac{E}{F}} = 2.4\sqrt{\frac{205,000}{235}} = 70.89$$

Depth to thickness ratio is “OK”.

For flanges of beams in bending (Cl. 8.3):

$$\frac{B}{t_f} = \frac{150}{13} = 11.54 < 1.6\sqrt{\frac{E}{F}} = 1.6\sqrt{\frac{205,000}{235}} = 47.26$$

Depth to thickness ratio is “OK”.

<u>Allowable Compressive Stress</u>

The slenderness ratio of compression members (Cl. 11.1):

$$\lambda_y = \frac{K_y \times L_y}{r_y} = \frac{1 \times 5,000}{34.67} = 144.2$$

Slenderness ratio dividing elastic and inelastic buckling (Cl no 5.5):

$$\Lambda = \sqrt{\frac{\pi^2 \times E}{0.6 \times F}} = \sqrt{\frac{\pi^2 \times 205,000}{0.6 \times 235}} = 119.8$$

$$v = \frac{3}{2} + \frac{2}{3} \times \left(\frac{\lambda}{\Lambda}\right)^2 = \frac{3}{2} + \frac{2}{3} \times \left(\frac{144.2}{119.8}\right)^2 = 2.466$$

$\lambda > \Lambda$, so the allowable compressive stress is given by Cl. 5.4:

$$f_c = \frac{0.277 \times F}{\left(\frac{\lambda}{\Lambda}\right)^2} = \frac{0.277 \times 235}{\left(\frac{144.2}{119.8}\right)^2} = 44.92\ \text{MPa}$$

<u>Allowable Flexural Stress</u>

Distance between braced points of the compression flange, $l_b = 5,000\ mm$.

The yield moment, $M_y = F \times Z_z = \frac{235 \times 627.2(10)^3}{10^6} = 147.4\ kN \cdot m$

The modification factor for allowable flexural stress (Cl. 5.13):

$$C = 1$$

The elastic lateral-torsional buckling moment (Cl 5.12):

$$M_e = C \times \sqrt{\frac{\pi^4 \times E \times I_y \times E \times I_w}{l_b{}^4} + \frac{\pi^2 \times E \times I_y \times G \times J}{l_b{}^2}}$$

$$\frac{\pi^4 \times E \times I_y \times E \times I_w}{l_b{}^4} = \frac{\pi^4 \times 205{,}000 \times 7.324 \times 10^6 \times 205{,}000 \times 150.6 \times 10^9}{5{,}000^4} = 7.224 \times 10^{15}$$

$$\frac{\pi^2 \times E \times I_y \times G \times J}{l_b{}^2} = \frac{\pi^2 \times 205{,}000 \times 7.324 \times 10^6 \times 79{,}000 \times 26.87 \times 10^3}{5{,}000^2} = 1.258 \times 10^{15}$$

$$= 1.0 \times \sqrt{7.224 \times 10^{15} + 1.258 \times 10^{15}} = 140.6 \text{ kN} \cdot \text{m}$$

The maximum slenderness ratio to achieve the plastic strength (Cl. 5.12):

$$p\lambda_b = 0.3$$

The elastic slenderness limit:

$$e\lambda_b = \frac{1}{\sqrt{0.6}} = 1.291$$

Slenderness ratio of the flexural member, $\lambda_b = \sqrt{\frac{M_y}{M_e}} = 1.024$

Here, $p\lambda_b < \lambda_b \le e\lambda_b$, so:

$$\nu = \frac{3}{2} + \frac{2}{3} \times \left(\frac{\lambda_b}{e\lambda_b}\right)^2 = \frac{3}{2} + \frac{2}{3} \times \left(\frac{1.024}{1.291}\right)^2 = 1.919$$

$$f_b = \frac{\left(1 - 0.4 \times \frac{\lambda_b - p\lambda_b}{e\lambda_b - p\lambda_b}\right) \times F}{\nu} = \frac{\left(1 - 0.4 \times \frac{1.024 - 0.3}{1.291 - 0.3}\right) \times 235}{1.919} = 86.68 \text{ MPa}$$

Results

Table 688:

- *D9.B.2 Member Capacities* (on page 1720)

V.AIJ 2005 UPT Tee

Verify the bending capacity and compression capacity of a tee section beam.

Details

The member is a 2 m long simply-supported beam. The section used is a CT100x200x8x12. The steel has a yield strength of 235 MPa, a modulus of elasticity of $205\times(10)^3$ MPa, and a shear modulus of $79\times(10)^3$ MPa.

The member is subject to the following loads:

a -10 kN concentrated force at mid-span in the global Y direction
a -2 kN·m concentrated moment at the left end
a 2 kN·m concentrated moment at the right end

Validation

Section Properties

Dimensions:

Leg, $D = 100\ mm$
Width, $B = 200\ mm$
Thickness of web, $t_w = 8\ mm$
Thickness of flange, $t_f = 12\ mm$

Depth of web, $d = D - t_f = 88\ mm$

Area, $A_x = 3{,}104\ mm^2$

Moment of inertia about major axis, $I_z = 1.844(10)^6\ mm^4$

Moment of inertia about minor axis, $I_y = 8.004(10)^6\ mm^4$

Major axis section modulus, $Z_z = 22.31(10)^3\ mm^3$

Minor axis section modulus, $Z_y = 80.04(10)^3\ mm^3$

Torsional constant, $J = 130(10)^3\ mm^4$

Warping constant, $C_W = 107.8(10)^9\ mm^6$

Radius of gyration about major axis, $r_z = \sqrt{I_z/A} = 24.07\ mm$

Radius of gyration about minor axis, $r_y = \sqrt{I_y/A} = 50.21\ mm$

Section Classification

For webs of beams in bending (Cl. 8.5):

$$\frac{d}{t_w} = \frac{88}{8} = 11 < 0.53\sqrt{\frac{E}{F}} = 0.53\sqrt{\frac{205{,}000}{235}} = 15.65$$

Depth to thickness ratio is “OK”.

Allowable Compressive Stress

The slenderness ratio of compression members (Cl. 11.1):

$$\lambda_z = \frac{K_z \times L_z}{r_z} = \frac{1 \times 2{,}000}{24.07} = 83.11$$

Slenderness ratio dividing elastic and inelastic buckling (Cl no 5.5):

$$\Lambda = \sqrt{\frac{\pi^2 \times E}{0.6 \times F}} = \sqrt{\frac{\pi^2 \times 205{,}000}{0.6 \times 235}} = 119.8$$

$$\nu = \frac{3}{2} + \frac{2}{3}\times\left(\frac{\lambda}{\Lambda}\right)^2 = \frac{3}{2} + \frac{2}{3}\times\left(\frac{83.11}{119.8}\right)^2 = 1.821$$

$\lambda < \Lambda$, so the allowable compressive stress is given by Cl. 5.3:

$$f_c = \frac{\left[1 - 0.4\left(\frac{\lambda}{\Lambda}\right)^2\right] \times F}{\nu} = \frac{\left[1 - 0.4\left(\frac{83.11}{119.8}\right)^2\right] \times 235}{1.821} = 104.2\ \mathrm{MPa}$$

Allowable Flexural Stress

Distance between braced points of the compression flange, $l_b = 2{,}000\ mm$.

The yield moment, $M_y = F \times Z_z = \frac{235 \times 80.04(10)^3}{10^6} = 18.8\ kN{\cdot}m$

The modification factor for allowable flexural stress (Cl. 5.13):

$$C = 1$$

The elastic lateral-torsional buckling moment (Cl 5.12):

$$M_e = C \times \sqrt{\frac{\pi^4 \times E \times I_y \times E \times I_w}{l_b^4} + \frac{\pi^2 \times E \times I_y \times G \times J}{l_b^2}}$$

$$\frac{\pi^4 \times E \times I_y \times E \times I_w}{l_b^4} = \frac{\pi^4 \times 205{,}000 \times 1.844 \times 10^6 \times 205{,}000 \times 107.8 \times 10^9}{2{,}000^4} = 50.86 \times 10^{15}$$

$$\frac{\pi^2 \times E \times I_y \times G \times J}{l_b^2} = \frac{\pi^2 \times 205{,}000 \times 1.844 \times 10^6 \times 79{,}000 \times 13 \times 10^3}{2{,}000^2} = 0.958 \times 10^{15}$$

$$= 1.0 \times \sqrt{50.86 \times 10^{15} + 0.958 \times 10^{15}} = 98.03 \text{ kN} \cdot \text{m}$$

The maximum slenderness ratio to achieve the plastic strength (Cl. 5.12):

$$p\lambda_b = 0.6$$

The elastic slenderness limit:

$$e\lambda_b = \frac{1}{\sqrt{0.6}} = 1.291$$

Slenderness ratio of the flexural member, $\lambda_b = \sqrt{\frac{M_y}{M_e}} = 0.43$

Here, $\lambda_b < p\lambda_b$, so:

$$\nu = \frac{3}{2} + \frac{2}{3} \times \left(\frac{\lambda_b}{e\lambda_b}\right)^2 = \frac{3}{2} + \frac{2}{3} \times \left(\frac{0.43}{1.291}\right)^2 = 1.573$$

$$f_b = \frac{F}{\nu} = \frac{235}{1.573} = 149.4 \text{ MPa}$$

Results

Table 689:

Result Type	Reference	STAAD.Pro	Difference	Comments
Allowable compressive stress (MPa)	104.2	104.24	negligible	
Allowable flexural stress (MPa)	149.4	149.04	negligible

V. New Zealand

V.NZS3404 1997-Angle section compact

Verify the design capacity of compact angle section as per NZ3404 1997.

Details

The member is an A150X150X19 section used in a 5 m cantilever member. The cantilever is loaded with a 2 kN point load at the free end. Steel grade is 280 MPa.

Validation

<u>Section Classification</u>

$$\lambda_{ef} = \frac{B}{2t_f}\sqrt{\frac{f_y}{250}} = \frac{150}{19}\sqrt{\frac{280}{250}} = 7.297$$

Section classification is compact.

<u>Section Bending Capacity About Z-Axis</u>

Effective Section Modulus, $Z_{ez} = 110{,}960\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sz} = \phi f_y \times Z_{ez}$

$M_{sz} = 280\times 110{,}960/10^6 = 31.07$ kN·m

$\phi M_{sz} = 0.9\times 31.07 = 27.962$ kN·m

<u>Section Bending Capacity About Y-Axis</u>

Effective Section Modulus, $Z_{ey} = 248{,}967\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sy} = \phi f_y \times Z_{ey}$

$M_{sy} = 280\times 248{,}967/10^6 = 69.71$ kN·m

$\phi M_{sy} = 0.9\times 69.71 = 62.74$ kN·m

<u>Member Bending Capacity</u>

End restraint arrangement = FU

A twist restraint factor, $K_t = 1.0$

Minor axis rotation restraints = Both

Lateral rotation restraint factor, $K_r = 1.0$

Load Height factor, Kl, (LHT) = 1.00 *[Ref : Table 5.6.3(2)]*

Effective length = 1×1×0.7×9,000 = 6,300 mm

$$\alpha_m = \frac{1.7M_m^*}{\sqrt{\left(M_2^*\right)^2 + \left(M_3^*\right)^2 + \left(M_4^*\right)^2}} \leq 2.5$$

$\alpha_m = 1.25$

Reference buckling moment, M_o

$$M_o = \sqrt{\frac{\pi^2 EI_y}{L_e^2}\left[GJ + \left(\frac{\pi^2 EI_w}{L_e^2}\right)\right]} = 137.62\ kN \cdot m$$

$$\alpha_s = 0.6\left\{\sqrt{\left[\left(\frac{M_{sy}}{M_{oa}}\right)^2 + 3\right]} - \left(\frac{M_{sy}}{M_{oa}}\right)\right\} = 0.780$$ [Ref : Clause 5.6.1.1 (c)]

$M_{bx} = \alpha_m \alpha_s M_{sy} \leq M_{sy}$

$M_{bz} = 1.25 \times 0.780 \times 69.71 = 67.98$ kN·m $\leq (M_{sz}, M_{sy})_{Max.}$ [Ref : Clause 5.6.1.1.1(a)]

$\phi M_{bz} = 0.9\times 67.98 = 61.17$ kN·m

<u>Check for Shear</u>

Shear Area of the section, $A_y = d\times t_w = 150\times 19 = 2{,}850\ mm^2$

Section Shear Capacity (Along Y axis), $V_y = 0.6\times f_y\times A_y = 0.6\times 280\times 2{,}850 = 478\ kN$

$V_{vn} = 2\times 478/(0.9 + 1.2) = 456$ kN [Ref : Clause 5.11.2]

$\phi V_y = 0.9\times 456 = 410.4$ kN

Shear Area of the section, $A_Z = b_f\times t_f = 150\times 19 = 2{,}850\ mm^2$

Section Shear Capacity (Along z axis), $V_z = 0.6 \times f_y \times A_z = 0.6 \times 280 \times 2{,}850 = 478\ kN$

$V_{vn} = 2 \times 478/(0.9 + 1.2) = 456$ kN

$\phi V_z = 456 \times 0.9 = 410.4$ kN

Check for Axial Compression

Section Compression Capacity:

Gross Area, $A_g = 5{,}360\ mm^2$

Net Area, $A_n = 5{,}360\ mm^2$

Form factor, $K_f = A_e / A_g = 1$

The nominal member section capacity for axial compression,

$N_s = K_f \times A_n \times f_y = 1 \times 5{,}360 \times 280 = 1500.8$ kN

$\phi N_s = 0.9 \times 1500.8 = 1{,}350.7$ kN [Ref : Clause 6.2.1]

Member Compression Capacity

Length of the member, $L = 5{,}000\ mm$

Effective length factor for slenderness & buckling about minor Y- axis, $K_y = 1.00$

Effective length factor for slenderness & buckling about minor Z- axis, $K_z = 1.00$

Effective Length of member, $L_{ez} = 5{,}000\ mm$

Effective Length of member, $L_{ey} = 5{,}000\ mm$

Geometrical Slenderness Ratio = $L_{ez}/r_z = 5{,}000\ /\ 29.3 = 170.648$

Geometrical Slenderness Ratio = $L_{ey}/r_y = 5{,}000\ /\ 57.362 = 87.166$

Member slenderness,

$$\lambda_{nz} = \frac{L_{ez}}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 170.648\sqrt{1}\sqrt{\frac{280}{250}} = 180.097$$ [Ref : Clause 6.3.3]

$$\lambda_{ny} = \frac{L_{ey}}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 87.166\sqrt{1}\sqrt{\frac{280}{250}} = 92.248$$ [Ref : Clause 6.3.3]

$\alpha_{az} = 2{,}100 \times (\lambda_{nz} - 13.5)/(\lambda_{nz}^2 - 15.3\lambda_{nz} + 2{,}050) = 10.999$

$\alpha_{ay} = 2{,}100 \times (\lambda_{ny} - 13.5)/(\lambda_{ny}^2 - 15.3\lambda_{ny} + 2{,}050) = 18.077$

$\alpha_b = 0.5$ [Ref : Table 6.3.3(2)]

$\lambda_z = \lambda_{nz} + \alpha_{az} \times \alpha_z = 186.097$

$\lambda_y = \lambda_{ny} + \alpha_{ay} \times \alpha_b = 101.286$

$\eta = 0.563$

$\eta = 0.286$

$\xi_z = ((\lambda_z/90)^2 + 1 + \eta)/(2 \times (\lambda_z/90)^2) = 0.683$

$\xi_y = ((\lambda_y/90)^2 + 1 + \eta)/(2 \times (\lambda_y/90)^2) = 1.008$

$\alpha_{cz} = 0.201$

$\alpha_{cy} = 0.532$

The nominal member capacity,

$N_{cz}= \alpha_{cz}\times N_s = 0.201\times 1{,}500.8 = 301.388$ kN [Ref : Clause 6.3.3]

$\phi N_{cz} = 271.3$ kN

The nominal member capacity,

$N_{cy}= \alpha_{cy}\times N_s = 0.532\times 1{,}500.8 = 798.946$ kN [Ref : Clause 6.3.3]

$\phi N_{cy} = 719.1$ kN

Nominal Section tension Capacity

[Ref : Clause 7.1]

$K_{te} = 1.00$

$N_{t1} = A_g\times f_y = 1{,}500.8$ kN

$N_{t2} = 0.85\times K_{te}\times A_n\times f_u = 2{,}004.6$ kN

$\phi N_t = 1{,}350.7$ kN [Ref : Clause 5.6.1.1.1(a)]

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\New Zealand\NZS3404 1997-Angle section compact.std` is typically installed with the program.

The following D11.A.6 Design Parameters (on page 1776) are used:

- The twist restraint factor, K_t = 1 is specified by `SKT 1.0` (default value; K_t is calculated)

- The lateral rotation restraint factor, K_r = 1.0 is specified by `SKR 1.0` (default value; K_r is calculated)

V.NZS3404 1997-Angle section Non compact

Verify the design capacity of equal leg, non-compact angle section as per NZ3404 1997.

Details

The member is an A150X150X12 section used in a 5 m cantilever member. The cantilever is loaded with a 2 kN point load at the mid-point. Steel grade is 300 MPa.

Validation

Section Classification

Evaluate the slenderness effects of the beam flanges:

$$\lambda_{ef} = \frac{B}{t_f}\sqrt{\frac{f_y}{250}} = \frac{138}{12}\sqrt{\frac{300}{250}} = 12.60$$

Section flange classification is non-compact.

Evaluate the slenderness effects of the beam web:

$$\lambda_{ew} = \frac{d}{t_w}\sqrt{\frac{f_y}{250}} = \frac{138}{12}\sqrt{\frac{300}{250}} = 12.60$$

Section web classification is non-compact

Section Bending Capacity About Z-Axis

Effective Section Modulus, $Z_{ez} = 72{,}560\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sz} = \phi f_y \times Z_{ez}$

$$M_{sz} = 300\times 72{,}560/10^6 = 21.77\ kN\cdot m$$

$$\phi M_{sz} = 0.9\times 21.77 = 19.59\ kN\cdot m$$

Section Bending Capacity About Y-Axis

Effective Section Modulus, $Z_{ey} = 155{,}980\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sy} = \phi f_y \times Z_{ey}$

$$M_{sy} = 300\times 155{,}980/10^6 = 46.79\ kN\cdot m$$

$$\phi M_{sy} = 0.9\times 46.79 = 42.11\ kN\cdot m$$

Member Bending Capacity

End restraint arrangement = FU

A twist restraint factor, $K_t = 1.00$

Lateral rotation restraint factor, K_r = 1.0

Load Height factor, Kl, = 1.00 *[Ref : Table 5.6.3(2)]*

Effective length = 1×1×1×5,000 = 5,000 mm

$$\alpha_m = \frac{1.7M_m^*}{\sqrt{(M_2^*)^2 + (M_3^*)^2 + (M_4^*)^2}} \leq 2.5$$

$\alpha_m = 1.25$

Reference buckling moment, M_o

$$M_o = \sqrt{\frac{\pi^2 EI_y}{L_e^2}\left[GJ + \left(\frac{\pi^2 EI_w}{L_e^2}\right)\right]} = 57.42\ kN \cdot m$$

$$\alpha_s = 0.6\left\{\sqrt{\left[\left(\frac{M_{sy}}{M_{oa}}\right)^2 + 3\right]} - \left(\frac{M_{sy}}{M_{oa}}\right)\right\} = 0.660$$ [Ref : Clause 5.6.1.1 (c)]

$M_{bx} = \alpha_m \alpha_s M_{sy} \leq M_{sy}$

$M_{bz} = 1.25 \times 0.660 \times 46.79 = 38.61\ kN \cdot m \leq (M_{sz}, M_{sy})_{Max.}$ [Ref : Clause 5.6.1.1.1(a)]

$\phi M_{bz} = 0.9 \times 38.61 = 34.74\ kN \cdot m$

<u>Check for Shear</u>

Shear Area of the section, $A_y = d \times t_w = 150 \times 12 = 1{,}800\ mm^2$

Section Shear Capacity (Along Y axis), $V_y = 0.6 \times f_y \times A_y = 0.6 \times 300 \times 1{,}800 = 324\ kN$

$V_{vn} = 2 \times 324/(0.9 + 1.2) = 308.6\ kN$ [Ref : Clause 5.11.2]

$\phi V_y = 0.9 \times 308.6 = 277.7\ kN$

Shear Area of the section, $A_Z = b_f \times t_f = 150 \times 12 = 1{,}800\ mm^2$

Section Shear Capacity (Along z axis), $V_z = 0.6 \times f_y \times A_z = 0.6 \times 300 \times 1{,}800 = 324\ kN$

$V_{vn} = 2 \times 324/(0.9 + 1.2) = 308.6\ kN$

$\phi V_z = 0.9 \times 308.6 = 277.7\ kN$

<u>Check for Axial Compression</u>

Section Compression Capacity:

Gross Area, $A_g = 3{,}480\ mm^2$

Net Area, $A_n = 3{,}480\ mm^2$

Form factor, $K_f = A_e/A_g = 1$

The nominal member section capacity for axial compression,

$N_s = K_f \times A_n \times f_y = 1 \times 3{,}480 \times 300 = 1{,}044\ kN$ [Ref : Clause 6.2.1]

$\phi N_s = 0.9 \times 1{,}044 = 939.6\ kN$

<u>Member Compression Capacity</u>

Length of the member, $L = 5{,}000\ mm$

Effective length factor for slenderness & buckling about minor Y- axis, $K_y = 2.2$

Effective length factor for slenderness & buckling about minor Z- axis, $K_z = 2.2$

Effective Length of member, $L_{ez} = 2.2 \times 5{,}000\ mm = 11{,}000\ mm$

Effective Length of member, $L_{ey} = 2.2 \times 5{,}000\ mm = 11{,}000\ mm$

Geometrical Slenderness Ratio = $L_{ez}/r_z = 11{,}000\ /\ 29.6 = 371.62$

Geometrical Slenderness Ratio = $L_{ez}/r_z = 11{,}000\ /\ 58.609 = 187.7$

Member slenderness,

$$\lambda_{nz} = \frac{L_{ez}}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 371.62\sqrt{1}\sqrt{\frac{300}{250}} = 407.1$$ [Ref : Clause 6.3.3]

$$\lambda_{ny} = \frac{L_{ey}}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 187.7\sqrt{1}\sqrt{\frac{300}{250}} = 205.6$$ [Ref : Clause 6.3.3]

$\alpha_{az} = 2{,}100 \times (\lambda_{nz} - 13.5)/(\lambda_{nz}^2 - 15.3\lambda_{nz} + 2{,}050) = 5.116$

$\alpha_{ay} = 2{,}100 \times (\lambda_{ny} - 13.5)/(\lambda_{ny}^2 - 15.3\lambda_{ny} + 2{,}050) = 9.797$

$\alpha_b = 0.5$ [Ref : Table 6.3.3(2)]

$\lambda_z = \lambda_{nz} + \alpha_{az} \times \alpha_z = 409.65$

$\lambda_y = \lambda_{ny} + \alpha_{ay} \times \alpha_b = 210.50$

$\eta = 1.29$

$\eta = 0.64$

$\xi_z = ((\lambda_z/90)^2 + 1 + \eta)/(2 \times (\lambda_z/90)^2) = 0.56$

$\xi_y = ((\lambda_y/90)^2 + 1 + \eta)/(2 \times (\lambda_y/90)^2) = 0.65$

$\alpha_{cz} = 0.045$

$\alpha_{cy} = 0.160$

The nominal member capacity,

$N_{cz} = \alpha_{cz} \times N_s = 0.045 \times 1{,}044 = 46.98$ kN [Ref : Clause 6.3.3]

$\phi N_{cz} = 42.28$ kN

The nominal member capacity,

$N_{cy} = \alpha_{cy} \times N_s = 0.160 \times 1{,}044 = 167.0$ kN

$\phi N_{cy} = 150.3$ kN

Nominal Section tension Capacity *[Ref : Clause 7.1]*

$K_{te} = 1.00$

$N_{t1} = A_g \times f_y = 1{,}044$ kN

$N_{t2} = 0.85 \times K_{te} \times A_n \times f_u = 1{,}301.5$ kN

$\phi N_t = 0.9 \times 1{,}044 = 939.6$ kN [Ref : Clause 5.6.1.1.1(a)]

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\New Zealand\NZS3404 1997-Angle section Non compact.std` is typically installed with the program.

The following D11.A.6 Design Parameters (on page 1776) are used:

- The twist restraint factor, K_t = 1 is specified by `SKT 1.0` (default value; K_t is calculated)
- The lateral rotation restraint factor, K_r = 1.0 is specified by `SKR 1.0` (default value; K_r is calculated)

- *D11.A.5.1 Analytical Member Design* (on page 1769)

V.NZS3404 1997-Channel Section

Verify the design capacity of a channel section per NZS 3404 1997.

Details

The member is a PFC250 section used in a 9 m simply supported span. The beam is loaded with a vertical load of 8.4 kN point load at 5m from start end, a 10 kN axial load at the mid-point, and a distributed load that decreases from 0.5 kN/m at the start down to 0.2 kN/m at the end. Steel grade is 300 MPa.

Validation

Section Classification

Evaluate the slenderness effects of the beam flanges:

$$\lambda_{ef} = \frac{B}{2t_f}\sqrt{\frac{f_y}{250}} = \frac{90}{15}\sqrt{\frac{300}{250}} = 5.988$$

Section flange classification is compact.

Evaluate the slenderness effects of the beam web:

$$\lambda_{ew} = \frac{d}{t_w}\sqrt{\frac{f_y}{250}} = \frac{220}{8}\sqrt{\frac{300}{250}} = 30.124 < 89$$

Section web classification is compact

Section Bending Capacity About Z-Axis

Effective Section Modulus, $Z_{ez} = 421{,}000\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sz} = \phi f_y \times Z_{ez}$

$$M_{sz} = 300\times 421{,}000/10^6 = 126.3\ kN{\cdot}m$$

$$\phi M_{sz} = 0.9\times 126.3 = 113.67\ kN{\cdot}m$$

Section Bending Capacity About Y-Axis

Effective Section Modulus, $Z_{ey} = 88{,}925\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sy} = \phi f_y \times Z_{ey}$

$$M_{sy} = 300\times 88{,}925/10^6 = 26.68\ kN{\cdot}m$$

$$\phi M_{sy} = 0.9\times 26.68 = 24.01\ kN{\cdot}m$$

Member Bending Capacity

End restraint arrangement = FF

A twist restraint factor, K_t (SKT) = 1.00

Minor axis rotation restraints = Both

Lateral rotation restraint factor, K_r (SKR) = 0.70

Load Height factor, Kl, (LHT) = 1.00 *[Ref : Table 5.6.3(2)]*

Effective length = 1×1×1×9,000 = 9,000 mm

$$\alpha_m = \frac{1.7M_m^*}{\sqrt{\left(M_2^*\right)^2 + \left(M_3^*\right)^2 + \left(M_4^*\right)^2}} = \frac{1.7 \times 22.416}{\sqrt{(-12.087)^2 + (-22.416)^2 + (-12.087)^2}} = 1.352 \leq 2.25$$

Reference buckling moment, M_o

$$M_o = \sqrt{\frac{\pi^2 EI_y}{L_e^2}\left[GJ + \left(\frac{\pi^2 EI_w}{L_e^2}\right)\right]} = 42.25\ kN{\cdot}m$$

[Ref : Clause 5.6.1.1 (c)]

$$\alpha_s = 0.6\left\{\sqrt{\left[\left(\frac{M_{sx}}{M_{oa}}\right)^2 + 3\right]} - \left(\frac{M_{sx}}{M_{oa}}\right)\right\} = 0.281$$

$M_{bx} = \alpha_m \alpha_s M_{sx} \leq M_{sx}$

$M_{bz} = 1.352 \times 0.281 \times 126.3 = 48.0$ kN·m $\leq (M_{sz}, M_{sy})_{Max.}$ [Ref : Clause 5.6.1.1.1(a)]

$\phi M_{bz} = 0.9 \times 48.0 = 43.19$ kN·m

Check for Shear

Shear Area of the section, $A_y = d \times t_w = 250 \times 8 = 2{,}000\ mm^2$

Section Shear Capacity (Along Y axis), $V_y = 0.6 \times f_y \times A_y = 0.6 \times 300 \times 2{,}000 = 384\ kN$

$V_{vn} = 2 \times 324/(0.9 + 1.2) = 308.6$ kN [Ref : Clause 5.11.2]

$\phi V_y = 0.9 \times 384 = 345.6$ kN

Shear Area of the section, $A_Z = 2 \times b_f \times t_f = 2 \times 90 \times 15 = 2{,}700\ mm^2$

Section Shear Capacity (Along z axis), $V_z = 0.6 \times f_y \times A_z = 0.6 \times 300 \times 2{,}700 = 486\ kN$

$\phi V_z = 0.9 \times 486 = 437.4$ kN

Check for Axial Compression

Section Compression Capacity:

The flange slenderness, $\lambda_{eb} = 5.9884$ [Ref : Cl - 6.2.3.1]

Yield slender for flange, $\lambda eby = 14$ [Ref : Table 6.2.4]

The web slenderness, $\lambda_{ew} = 30.125$

Gross Area, $A_g = 4{,}520\ mm^2$

Net Area, $A_n = 4{,}520\ mm^2$

Form factor, $K_f = A_e / A_g = 1$

The nominal member section capacity for axial compression,

$N_s = K_f \times A_n \times f_y = 1 \times 4{,}520 \times 300 = 1{,}356$ kN [Ref : Clause 6.2.1]

$\phi N_s = 0.9 \times 1{,}356 = 1{,}220.4$ kN

Member Compression Capacity

Length of the member, $L = 9{,}000\ mm$

Effective length factor for slenderness & buckling about minor Y- axis, $K_y = 1.0$

Effective length factor for slenderness & buckling about minor Z- axis, $K_z = 1.0$

Effective Length of member, $L_{ez} = 1.0 \times 9{,}000\ mm = 9{,}000\ mm$

Effective Length of member, $L_{ey} = 1.0 \times 9{,}000\ mm = 9{,}000\ mm$

Geometrical Slenderness Ratio = $L_{ez}/r_z = 9{,}000\ /\ 99.89 = 90.10$

Geometrical Slenderness Ratio = $L_{ey}/r_y = 9{,}000\ /\ 28.37 = 317.2$

Member slenderness,

[Ref : Clause 6.3.3]

$$\lambda_{nz} = \frac{L_{ez}}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 90.10\sqrt{1}\sqrt{\frac{300}{250}} = 98.70$$

[Ref : Clause 6.3.3]

$$\lambda_{ny} = \frac{L_{ey}}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 317.2\sqrt{1}\sqrt{\frac{300}{250}} = 347.5$$

$\alpha_{az} = 2{,}100 \times (\lambda_{nz} - 13.5)/(\lambda_{nz}^2 - 15.3\lambda_{nz} + 2{,}050) = 17.402$

$\alpha_{ay} = 2{,}100 \times (\lambda_{ny} - 13.5)/(\lambda_{ny}^2 - 15.3\lambda_{ny} + 2{,}050) = 5.970$

$\alpha_b = 0.5$ [Ref : Table 6.3.3(2)]

$\lambda_z = \lambda_{nz} + \alpha_{az} \times \alpha_z = 107.4$

$\lambda_y = \lambda_{ny} + \alpha_{ay} \times \alpha_b = 350.5$

$\eta = 0.31$

$\eta = 1.10$

$\xi_z = ((\lambda_z/90)^2 + 1 + \eta)/(2 \times (\lambda_z/90)^2) = 0.96$

$\xi_y = ((\lambda_y/90)^2 + 1 + \eta)/(2 \times (\lambda_y/90)^2) = 0.57$

$\alpha_{cz} = 0.493$

$\alpha_{cy} = 0.061$

The nominal member capacity,

$N_{cz} = \alpha_{cz} \times N_s = 0.493 \times 1{,}356 = 668.7$ kN [Ref : Clause 6.3.3]

$\phi N_{cz} = 601.8$ kN

The nominal member capacity,

$N_{cy} = \alpha_{cy} \times N_s = 0.061 \times 1{,}356 = 82.72$ kN [Ref : Clause 6.3.3]

$\phi N_{cy} = 74.44$ kN

Nominal Section tension Capacity

[Ref : Clause 7.1]

$K_{te} = 1.00$

$N_{t1} = A_g \times f_y = 1{,}356$ kN

$N_{t2} = 0.85 \times K_{te} \times A_n \times f_u = 1{,}690.5$ kN

$\phi N_t = 0.9 \times 1{,}356 = 1{,}220.4$ kN [Ref : Clause 5.6.1.1.1(a)]

Results

   AXIS NOTATION FOR ANY SECTION OTHER THAN ST ANGLE:-
   STAAD.Pro     NZS3404 Spec.     Description
   ---------     -------------     ---------------
      X/x             Z/z          Longitudinal axis of section
      Y/y             Y/y          Minor principal axis of section
      Z/z             X/x          Major Principal axis of section
   MEMBER DESIGN OUTPUT FOR PMEMBER     1
   DESIGN Notes
   ------------
   1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for
      that particular Load Case; i.e. analysis does not include second-order
effects.
   2. φ = 0.9 for all the calculations [NZS3404 Table 3.4]
   3. (#) next to Young's modulus E indicates that its value is not 200000
MPa as per NZS3404 1.4.

- *D11.A.5.1 Analytical Member Design* (on page 1769)

V.NZS3404 1997-I section

Verify the Design Capacity of I Section as per NZS3404 1997.

Details

Verify the Section bending capacity of an UB530X92.4. Span of the member = 9 m. Both ends of the member are simply supported.

Loads:

Concentrated in the Y direction: 84.5 kN (at a distance of 5m from the left support)
Concentrated in the Z direction: 10 kN (at mid-span)
Concentrated in the X direction: 10 kN (at mid-span)

Fy = 300 MPa

Validation

<u>Section Classification</u>

Evaluate the slenderness effects of the beam flanges:

$$\lambda_{ef} = \frac{B}{2t_f}\sqrt{\frac{f_y}{250}} = \frac{198.8}{2(15.60)}\sqrt{\frac{300}{250}} = 6.98 < 8$$

Section flange classification is compact.

Evaluate the slenderness effects of the beam web:

$$\lambda_{ew} = \frac{d}{t_w}\sqrt{\frac{f_y}{250}} = \frac{501.8}{10.20}\sqrt{\frac{300}{250}} = 56.89 < 89$$

Section web classification is compact

<u>Section Bending Capacity About Z-Axis</u>

Effective Section Modulus, $Z_{ez} = 2.37 \times 10^6\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sz} = \phi f_y \times Z_{ez}$

$$M_{sz} = 300\times 2.37 = 711 \text{ kN}\cdot\text{m}$$

$$\phi M_{sz} = 0.9\times 700 = 639.9 \text{ kN}\cdot\text{m}$$

<u>Section Bending Capacity About Y-Axis</u>

Effective Section Modulus, $Z_{ey} = 341.6 \times 10^3\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sy} = \phi f_y \times Z_{ey}$

$$M_{sy} = 300\times 341.6\times 10^3/10^6 = 102.5 \text{ kN}\cdot\text{m}$$

$$\phi M_{sy} = 0.9\times 102.5 = 92.23 \text{ kN}\cdot\text{m}$$

<u>Member Bending Capacity</u>

End restraint arrangement = FF

A twist restraint factor, K_t (SKT) = 1.00

Minor axis rotation restraints = Both

Lateral rotation restraint factor, K_r (SKR) = 0.70

Load Height factor, Kl, (LHT) = 1.00 *[Ref : Table 5.6.3(2)]*

Effective length = 1×1×0.7×9,000 = 6,300 mm

$$\alpha_m = \frac{1.7M_m^*}{\sqrt{(M_2^*)^2 + (M_3^*)^2 + (M_4^*)^2}} = \frac{1.7 \times 109.8}{\sqrt{(3.383)^2 + (-77.73)^2 + (-7.246)^2}} = 2.389 \leq 2.5$$

Reference buckling moment, M_o

$$M_o = \sqrt{\frac{\pi^2 EI_y}{L_e^2}\left[GJ + \left(\frac{\pi^2 EI_w}{L_e^2}\right)\right]} = 416.5 \text{ kN·m}$$

$$\alpha_s = 0.6\left\{\sqrt{\left[\left(\frac{M_{sx}}{M_{oa}}\right)^2 + 3\right]} - \left(\frac{M_{sx}}{M_{oa}}\right)\right\} = 0.435$$ [Ref : Clause 5.6.1.1 (c)]

$M_{bx} = \alpha_m \alpha_s M_{sx} \leq M_{sx}$

$M_{bz} = 2.389 \times 0.435 \times 416.5 = 711.0 \text{ kN·m} \leq (M_{sz}, M_{sy})_{Max.}$ [Ref : Clause 5.6.1.1.1(a)]

$\phi M_{bz} = 0.9 \times 711.0 = 639.9 \text{ kN·m}$

Check for Shear

Shear Area of the section, $A_y = d \times t_w = 533 \times 10.2 = 5{,}437\ mm^2$

Section Shear Capacity (Along Y axis), $V_y = 0.6 \times f_y \times A_y = 0.6 \times 300 \times 5{,}437 = 1{,}044\ kN$

$\phi V_y = 0.9 \times 1{,}044 = 939.4$ kN

Shear Area of the section, $A_Z = 2 \times b_f \times t_f = 2 \times 209 \times 15.6 = 6{,}521\ mm^2$

Section Shear Capacity (Along z axis), $V_z = 0.6 \times f_y \times A_z = 0.6 \times 300 \times 6{,}521 = 1{,}174\ kN$

$\phi V_z = 0.9 \times 1{,}174 = 1{,}056$ kN

Check for Axial Compression

Section Compression Capacity:

The flange slenderness, $\lambda_{eb} = 6.98$ [Ref : Cl - 6.2.3.1]

Yield slender for flange, $\lambda_{eby} = 16$ [Ref : Table 6.2.4]

The web slenderness, $\lambda_{ew} = 55.66$

Gross Area, $A_g = 11{,}800\ mm^2$

Net Area, $A_n = 11{,}800\ mm^2$

Form factor, $K_f = A_e/A_g = 0.92$

The nominal member section capacity for axial compression,

$N_s = K_f \times A_n \times f_y = 0.92 \times 11{,}800 \times 300 = 3{,}257$ kN [Ref : Clause 6.2.1]

$\phi N_s = 0.9 \times 3{,}257 = 2{,}931$ kN

Member Compression Capacity

Length of the member, $L = 9{,}000\ mm$

Effective length factor for slenderness & buckling about minor Y- axis, $K_y = 1.0$

Effective length factor for slenderness & buckling about minor Z- axis, $K_z = 1.0$

Effective Length of member, $L_{ez} = 1.0 \times 9{,}000\ mm = 9{,}000\ mm$

Effective Length of member, $L_{ey} = 1.0 \times 9{,}000\ mm = 9{,}000\ mm$

$r_z = \sqrt{(554 \times 10^6 / 11{,}800)} = 216.7$

$r_y = \sqrt{(23.8 \times 10^6 / 11{,}800)} = 44.91$

Geometrical Slenderness Ratio = $L_{ez}/r_z = 9{,}000\ /\ 216.7 = 41.54$

Geometrical Slenderness Ratio = $L_{ey}/r_y = 9{,}000\ /\ 44.91 = 200.4$

Member slenderness,

$$\lambda_{nz} = \frac{L_{ez}}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 41.54\sqrt{1}\sqrt{\frac{300}{250}} = 43.57$$ [Ref : Clause 6.3.3]

$$\lambda_{ny} = \frac{L_{ey}}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 200.4\sqrt{1}\sqrt{\frac{300}{250}} = 210.1$$ [Ref : Clause 6.3.3]

$\alpha_{az} = 2{,}100 \times (\lambda_{nz} - 13.5)/(\lambda_{nz}^2 - 15.3\lambda_{nz} + 2{,}050) = 19.24$

$\alpha_{ay} = 2{,}100 \times (\lambda_{ny} - 13.5)/(\lambda_{ny}^2 - 15.3\lambda_{ny} + 2{,}050) = 9.60$

$\alpha_b = 0.0$ [Ref : Table 6.3.3(2)]

$\lambda_z = \lambda_{nz} + \alpha_{az} \times \alpha_z = 43.57$

$\lambda_y = \lambda_{ny} + \alpha_{ay} \times \alpha_b = 210.1$

$\eta = 0.10$

$\eta = 0.64$

$\xi_z = ((\lambda_z/90)^2 + 1 + \eta)/(2 \times (\lambda_z/90)^2) = 2.84$

$\xi_y = ((\lambda_y/90)^2 + 1 + \eta)/(2 \times (\lambda_y/90)^2) = 0.65$

$\alpha_{cz} = 0.89$

$\alpha_{cy} = 0.16$

The nominal member capacity,

$N_{cz} = \alpha_{cz} \times N_s = 0.89 \times 3{,}246 = 2{,}888$ kN [Ref : Clause 6.3.3]

$\phi N_{cz} = 2{,}600$ kN

The nominal member capacity,

$N_{cy} = \alpha_{cy} \times N_s = 0.16 \times 3{,}246 = 521.9$ kN [Ref : Clause 6.3.3]

$\phi N_{cy} = 470$ kN

<u>Combined Bending and Axial</u>

Section Combined Capacity (About Z-axis) ≤ M_{sz}

$M_{rz} = 1.18 \times M_{sz} \times (1 - N/\phi N_{sz}) = 837.54$ kN·m

$M_{rz} = 1.18 \times M_{sz} \times (1 - N/\phi N_{sz}) = 837.54$ kN·m

$\phi M_{rz} = 639.90$ kN·m

Section Combined Capacity (About y-axis) ≤ M_{sy}

$M_{rz} = 1.19 \times M_{sy} \times (1-(N/\phi N_{sy})^2) = 121.96$ kN·m

$\phi M_{ry} = 92.239$ kN·m

Section Combined Capacity (Biaxial) [Ref : Cl -8.1.5]

$\lambda = 1.4+(N/\phi Ns) = 1.402$

$(M_z/\phi M_{rz})\lambda + (M_y/\phi M_{ry})\lambda = 0.14$

Member in-plane Capacity (Z-axis) $M_{iz} \leq M_{rz}$

$M_{iz} = M_{sz}\{[1-(1+ßm/2)3](1-N/\phi N_{cz}) + 1.18(1+ßm/2)3\sqrt{}(1-N/\phi N_{cz})\} = 709.63$ kN·m

$\phi M_{iz} = 638.67$ kN·m

Member in-plane Capacity (y-axis) $M_{iy} \leq M_{ry}$ *[Ref : Cl - 8.4.4.2.2]*

$M_{sy}\{[1-(1+ßm/2)3](1-Ny/\phi N_{cy}) + 1.18(1+ßm/2)3\sqrt{}(1-Ny/\phi N_{cy})\} = 101.40$ kN·m

$\phi M_{iy} = 91.26$ kN·m

Member Out- of- plane Capacity (Tension) *[Ref : Cl - 8.4.4.2]*

$M_{ozt} = M_{bz}(1 + N/\phi N_t) = 712.12$ kN·m

Nominal out-plane member moment capacity,M_{ozt} = 711.00 kN·m

$\phi M_{ozt} = 639.90$ kN·m

Member Out-of-plane Capacity(Compression) $M_{oz} \leq M_{rz}$ *[Ref : Cl - 8.4.4.1]*

$M_{oz} = M_{bz}(1 - N/\phi N_{cy}) = 703.43$ kN·m

$\phi M_{ozc} = 633.09$ kN·m

Member Biaxial Capacity (Compression)

$M_{cz} = 709.63$ kN·m

$\phi M_{cz} = 638.67$ kN·m

$(M_z/\phi M_{cz})1.4+(M_y/\phi M_{iy})1.4 = 0.139$

Member Biaxial Capacity (tension)

$M_{tx} = 711.00$ kN·m

$\phi M_{tx} = 639.90$ kN·m

$(M_z/\phi M_{tz})1.4+(M_y/\phi M_{ry})1.4 = 0.116$

Results

V.NZS3404 1997-RHS Section

Verify the design capacity of a rectangular hollow section as per NZS3404 1997.

Details

Verify the section bending capacity of an HSST20X12X75 spanning 6 m. Steel grade is 250 MPa.

Note: This is the left column in the STAAD.Pro model (i.e., physical member no. 2).

Validation

Section Classification

Evaluate the slenderness effects of the Y axis:

$$\lambda_{ef} = \frac{B}{2t_f}\sqrt{\frac{f_y}{250}} = \frac{269.3}{2(17.73)}\sqrt{\frac{250}{250}} = 15.19$$

Section classification is compact.

Evaluate the slenderness effects of the Z axis:

$$\lambda_{ew} = \frac{d}{t_w}\sqrt{\frac{f_y}{250}} = \frac{472.5}{17.73}\sqrt{\frac{250}{250}} = 26.65$$

Section classification is compact

Section Bending Capacity About Z-Axis

Effective Section Modulus, $Z_{ez} = 4.425 \times 10^6\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sz} = \phi f_y \times Z_{ez}$

$$M_{sz} = 250 \times 4.425 \times 10^6 / 10^6 = 1{,}106 \text{ kN·m}$$

$$\phi M_{sz} = 0.9 \times 1{,}106 = 995.6 \text{ kN·m}$$

Section Bending Capacity About Y-Axis

Effective Section Modulus, $Z_{ey} = 3.114 \times 10^6\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sy} = \phi f_y \times Z_{ey}$

$$M_{sy} = 250 \times 3.114 \times 10^6 / 10^6 = 778.5 \text{ kN·m}$$

$$\phi M_{sy} = 0.9 \times 778.5 = 700.7 \text{ kN·m}$$

Member Bending Capacity

End restraint arrangement = LL

A twist restraint factor, K_t (SKT) = 1.00

Minor axis rotation restraints = Both

Lateral rotation restraint factor, K_r (SKR) = 1.0

Load Height factor, Kl, (LHT) = 1.00 *[Ref : Table 5.6.3(2)]*

Effective length = 1×1×1×6,000 = 6,000 mm

$\alpha_m = 1$ [Ref: Cl no -5.6.1.1 (b)]

Reference buckling moment, M_o

$$M_o = \sqrt{\frac{\pi^2 E I_y}{L_e^2}\left[GJ + \left(\frac{\pi^2 E I_w}{L_e^2}\right)\right]} = 41{,}334 \text{ kN·m}$$

$\alpha_s = 1$ [Ref : Clause 5.6.1.1 (c)]

$$M_{bx} = \alpha_m \alpha_s M_{sx} \le M_{sx}$$

$M_{bz} = 1 \times 1 \times 1{,}106 = 1{,}106\ kN{\cdot}m \le (M_{sz}, M_{sy})_{Max.}$ [Ref : Clause 5.6.1.1.1(a)]

$\phi M_{bz} = 0.9 \times 1{,}106 = 995.6\ kN{\cdot}m$

Check for Axial Compression

Section Compression Capacity:

Gross Area, $A_g = 26{,}774\ mm^2$

Net Area, $A_n = 26{,}774\ mm^2$

Form factor, $K_f = A_e / A_g = 1.0$

The nominal member section capacity for axial compression,

$N_s = K_f \times A_n \times f_y = 1.0 \times 26{,}774 \times 250 = 6{,}694\ kN$ [Ref : Clause 6.2.1]

$\phi N_s = 0.9 \times 6{,}694 = 6{,}024\ kN$

Member Compression Capacity

Length of the member, $L = 6{,}000\ mm$

Effective length factor for slenderness & buckling about minor Y- axis, $K_y = 1.0$

Effective length factor for slenderness & buckling about minor Z- axis, $K_z = 1.0$

Effective Length of member, $L_{ez} = 1.0 \times 6{,}000\ mm = 6{,}000\ mm$

Effective Length of member, $L_{ey} = 1.0 \times 6{,}000\ mm = 6{,}000\ mm$

$r_z = \sqrt{(911.5 \times 10^6 / 26{,}774)} = 184.5$

$r_y = \sqrt{411.2 \times 10^6 / 26{,}774)} = 123.9$

Geometrical Slenderness Ratio = $L_{ez}/r_z = 6{,}000\ /\ 184.5 = 32.5$

Geometrical Slenderness Ratio = $L_{ey}/r_y = 6{,}000\ /\ 123.9 = 48.4$

Member slenderness,

$$\lambda_{nz} = \frac{L_{ez}}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 32.5\sqrt{1}\sqrt{\frac{250}{250}} = 32.5$$ [Ref : Clause 6.3.3]

$$\lambda_{ny} = \frac{L_{ey}}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 48.4\sqrt{1}\sqrt{\frac{250}{250}} = 48.4$$ [Ref : Clause 6.3.3]

$\alpha_{az} = 2{,}100 \times (\lambda_{nz} - 13.5)/(\lambda_{nz}^2 - 15.3\lambda_{nz} + 2{,}050) = 15.30$

$\alpha_{ay} = 2{,}100 \times (\lambda_{ny} - 13.5)/(\lambda_{ny}^2 - 15.3\lambda_{ny} + 2{,}050) = 20.07$

$\alpha_b = -1.0$ [Ref : Table 6.3.3(2)]

$\lambda_z = \lambda_{nz} + \alpha_{az} \times \alpha_z = 17.22$

$\lambda_y = \lambda_{ny} + \alpha_{ay} \times \alpha_b = 28.34$

$\eta = 0.012$

$\eta = 0.048$

$\xi_z = ((\lambda_z/90)^2 + 1 + \eta)/(2 \times (\lambda_z/90)^2) = 14.33$

$\xi_y = ((\lambda_y/90)^2 + 1 + \eta)/(2 \times (\lambda_y/90)^2) = 5.785$

$\alpha_{cz} = 0.988$

α_{cy}= 0.949

The nominal member capacity,

N_{cz}= α_{cz}×N_s =0.988×6,694 = 6,611 kN [Ref : Clause 6.3.3]

ϕN_{cz} = 5,950 kN

The nominal member capacity,

N_{cy}= α_{cy}×N_s =0.949×6,694 = 6,353 kN [Ref : Clause 6.3.3]

ϕN_{cy} = 5,717 kN

Nominal Section tension Capacity

[Ref : Clause 7.1]

K_{te} = 1.00

N_{t1} = A_g×f_y = 6,024 kN

N_{t2} = 0.85×K_{te}×A_n×f_u = 6,694 kN

ϕN_t = 0.9×6,694 = 6,024 kN [Ref : Clause 5.6.1.1.1(a)]

Results

   AXIS NOTATION FOR ANY SECTION OTHER THAN ST ANGLE:-
   STAAD.Pro     NZS3404 Spec.     Description
   ---------     -------------     ---------------
      X/x             Z/z          Longitudinal axis of section
      Y/y             Y/y          Minor principal axis of section
      Z/z             X/x          Major Principal axis of section
   MEMBER DESIGN OUTPUT FOR PMEMBER     2
   DESIGN Notes
   ------------
   1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for
      that particular Load Case; i.e. analysis does not include second-order
effects.
   2. φ = 0.9 for all the calculations [NZS3404 Table 3.4]
   3. (#) next to Young's modulus E indicates that its value is not 200000
MPa as per NZS3404 1.4.

- *D11.A.5.1 Analytical Member Design* (on page 1769)

Details

From the reference:

> The 250UC89.5 beam in Grade 300 steel shown below is continuous over the supports at B and D and is free at A and E. The beam section is restrained against lateral deflection at B and D, fully restrained against twist rotation at B and D, and is unrestrained at A and E. A downward concentrated load of 5P* acts at C and a downward concentrated load of P* acts at A and E. These loads act at the top flange, and are free to deflect laterally with the beam. Determine the maximum value of P*.

Validation

Section Classification

Evaluate the slenderness effects of the flange:

$$\lambda_{ef} = \frac{B}{2t_f}\sqrt{\frac{f_y}{250}} = \frac{256}{2(17.3)}\sqrt{\frac{280}{250}} = 7.83$$

Section classification of the flange is compact.

Evaluate the slenderness effects of the web:

$$\lambda_{ew} = \frac{d}{t_w}\sqrt{\frac{f_y}{250}} = \frac{225.4}{10.5}\sqrt{\frac{280}{250}} = 22.72$$

Section classification of the web is compact

Section Bending Capacity About Z-Axis

Effective Section Modulus, $Z_{ez} = 1.23\times10^6\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sz} = \phi f_y \times Z_{ez}$

$$M_{sz} = 280 \times 1.23 \times 10^{-6} = 344.4 \text{ kN}\cdot\text{m}$$

$$\phi M_{sz} = 0.9 \times 344.4 = 309.96 \text{ kN}\cdot\text{m}$$

Section Bending Capacity About Y-Axis

Effective Section Modulus, $Z_{ey} = 575 \times 10^3 \ mm^3$

The nominal section capacity in bending about Z axis, $M_{sy} = \phi f_y \times Z_{ey}$

$$M_{sy} = 280 \times 575 \times 10^{-3} = 161 \text{ kN}\cdot\text{m}$$

$$\phi M_{sy} = 0.9 \times 161 = 144.9 \text{ kN}\cdot\text{m}$$

Member Bending Capacity of Cantilevers

End restraint arrangement = FU

A twist restraint factor, K_t (SKT) = 1.00

Minor axis rotation restraints = Both

Lateral rotation restraint factor, K_r (SKR) = 1.0

Load Height factor, Kl, (LHT) = 2 *[Ref : Table 5.6.3(2)]*

Effective length = 1×1×2×4,000 = 8,000 mm

The alpha value for a cantilever is taken from Table 5.6.2 in the code.

$$\alpha_m = 1.25 \qquad \text{[Ref. Table 5.6.2]}$$

Reference buckling moment, M_o

$$M_o = \sqrt{\frac{\pi^2 E I_y}{L_e^2}\left[GJ + \left(\frac{\pi^2 E I_w}{L_e^2}\right)\right]}$$

$$M_o = \sqrt{\frac{\pi^2(205)(4.84 \times 10^6)}{(8{,}000)^2}\left[80\left(1.04 \times 10^6\right) + \frac{\pi^2(205)(713 \times 10^9)}{(8{,}000)^2}\right]}10^{-3} = 399 \text{ kN}\cdot\text{m}$$

$$\alpha_s = 0.6\left\{\sqrt{\left[\left(\frac{M_{sx}}{M_{oa}}\right)^2 + 3\right]} - \left(\frac{M_{sx}}{M_{oa}}\right)\right\}$$

$$\alpha_s = 0.6\left\{\sqrt{\left[\left(\frac{344.4}{399}\right)^2 + 3\right]} - \left(\frac{344.4}{399}\right)\right\} = 0.643 \qquad \text{[Ref : Clause 5.6.1.1 (c)]}$$

$$M_{bx} = \alpha_m \alpha_s M_{sx} \le M_{sx}$$

$$M_{bz} = 1.25 \times 0.643 \times 344.4 = 276.8 \text{ kN}\cdot\text{m} \le (M_{sz}, M_{sy})_{Max.} \qquad \text{[Ref : Clause 5.6.1.1.1(a)]}$$

$$\phi M_{bz} = 0.9 \times 276.8 = 249.1 \text{ kN}\cdot\text{m}$$

Member Bending Capacity of Main Span

End restraint arrangement = FF

A twist restraint factor, K_t (SKT) = 1.00

Minor axis rotation restraints = Both

Lateral rotation restraint factor, K_r (SKR) = 1.0

Load Height factor, Kl, (LHT) = 1.4 *[Ref : Table 5.6.3(2)]*

Effective length = 1×1×1.4×8,000 = 11,200 mm

$$a_m = \frac{1.7M_m^{\times}}{\sqrt{\left(M_1^*\right)^2 + \left(M_2^*\right)^2 + \left(M_3^*\right)^2}} \leq 2.5$$

$$a_m = \frac{1.7 \times 6P^*}{\sqrt{(P^*)^2 + (6P^*)^2 + (P^*)^2}} = 1.655$$

Reference buckling moment, M_o

$$M_o = \sqrt{\frac{\pi^2 EI_y}{L_e^2}\left[GJ + \left(\frac{\pi^2 EI_w}{L_e^2}\right)\right]}$$

$$M_o = \sqrt{\frac{\pi^2(205)(4.84 \times 10^6)}{(11{,}200)^2}\left[80\left(1.04 \times 10^6\right) + \frac{\pi^2(205)(713 \times 10^9)}{(11{,}200)^2}\right]}10^{-3} = 271.9 \text{ kN·m}$$

$$a_s = 0.6\left\{\sqrt{\left[\left(\frac{M_{sx}}{M_{oa}}\right)^2 + 3\right]} - \left(\frac{M_{sx}}{M_{oa}}\right)\right\}$$

$$a_s = 0.6\left\{\sqrt{\left[\left(\frac{344.4}{271.9}\right)^2 + 3\right]} - \left(\frac{344.4}{271.9}\right)\right\} = 0.528$$ [Ref : Clause 5.6.1.1 (c)]

$M_{bx} = \alpha_m \alpha_s M_{sx} \leq M_{sx}$

$M_{bz} = 1.655 \times 0.528 \times 344.4 = 300.95 \text{ kN·m} \leq (M_{sz}, M_{sy})_{Max.}$ [Ref : Clause 5.6.1.1.1(a)]

$\phi M_{bz} = 0.9 \times 300.95 = 270.9 \text{ kN·m}$

<u>Maximum Load Determination</u>

The moments over the supports due to the cantilevers, $M_1 = M_2 = 4 \times P^*$

The maximum moment in the middle span occurs at the 5P load:

$$M_{max} = \frac{(5P^*)8}{4} - (M_1 + M_2) = 10P^* - 4P^* = 6P^*$$

So the maximum value of P* is derived from setting $M_{max} = \phi M_{bz}$ and solving for P*:

$P^* = \phi M_{bz}/6 = 270.9 / 6 = 45.1 \text{ kN}$

Results

Table 695: Comparison of results

Result Type	Calculations	STAAD.Pro	Difference	Comments
ϕM_{sz} (kN·m)	309.96	309.96	none	
ϕM_{sy} (kN·m)	144.9	142.9313	1.4%	
ϕM_{bz} (kN·m) - Cantilever	249.1	249.4725	negligible	
ϕM_{bz} (kN·m) - Main span	270.9	269.5	negligible	

Result Type	Calculations	STAAD.Pro	Difference	Comments
P* (kN)	45.1†	44.9‡	0.5%	

†The reference gives a P* value of 44.33 kN (though to be noted this is also calculated for the AS 4100 code as opposed to the NZS 34043 1997 code).

‡For STAAD.Pro, the value of 44.9 kips gives a critical ratio of 1.00 for the member bending capacity.

   MEMBER DESIGN OUTPUT FOR PMEMBER     2
   DESIGN Notes
   ------------
   1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for
      that particular Load Case; i.e. analysis does not include second-order
effects.
   2. φ = 0.9 for all the calculations [NZS3404 Table 3.4]
   3. (#) next to Young's modulus E indicates that its value is not 200000
MPa as per NZS3404 1.4.
   DESIGN SUMMARY
   --------------
   Designation: ST   UC250X89.5               (AISC SECTIONS)
   Governing Load Case:     1*
   Governing Criteria: Cl.
5.1
   Governing Ratio:   1.000  (PASS)
   Governing Location:   4.000 m from Start.

```

V.NZS3404 1997-Tube Section Compact

Verify the design capacity of a PIPX80 section per the NZS3404 1997 code.

Details

Verify the bending capacity of a PIPX80 member. Steel grade = 250 MPa. The simply supported span is 9 m with a 8.4 kN load at 5 m from the left support.

Validation

Section Classification

Evaluate the slenderness effects of the pipe member:

$$\lambda_{ew} = \frac{\mathrm{OD}}{t}\sqrt{\frac{f_y}{250}} = \frac{219.1}{11.8}\sqrt{\frac{250}{250}} = 18.3$$

Section classification is compact

Section Bending Capacity About Z-Axis

Effective Section Modulus, $Z_{ez} = 508 \times 10^3\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sz} = \phi f_y \times Z_{ez}$

$M_{sz} = 250\times 508\times10^3/10^6 = 127$ kN·m

$\phi M_{sz} = 0.9\times127 = 114.3$ kN·m

The pipe is symmetric, thus $\phi M_{sy} = \phi M_{sz}$

Member Bending Capacity

End restraint arrangement = LL

A twist restraint factor, K_t (SKT) = 1.00

Minor axis rotation restraints = Both

Lateral rotation restraint factor, K_r (SKR) = 1.0

Load Height factor, Kl, (LHT) = 1.00 *[Ref : Table 5.6.3(2)]*

Effective length = 1×1×1×9,000 = 9,000 mm

$\alpha_m = 1$ [Ref: Cl no -5.6.1.1 (b)]

Reference buckling moment, M_o

$$M_o = \sqrt{\frac{\pi^2 EI_y}{L_e^2}\left[GJ + \left(\frac{\pi^2 EI_w}{L_e^2}\right)\right]} = 2{,}641 \text{ kN·m}$$

$\alpha_s = 1$ [Ref : Clause 5.6.1.1 (c)]

$M_{bx} = \alpha_m \alpha_s M_{sx} \leq M_{sx}$

$M_{bz} = 1 \times 1 \times 127 = 127$ kN·m $\leq (M_{sz}, M_{sy})_{Max.}$ [Ref : Clause 5.6.1.1.1(a)]

$\phi M_{bz} = 0.9\times127 = 114.3$ kN·m

Check for Shear

Section Shear Capacity (Along Y axis), $V_y = 0.36\times f_y \times A_g = 0.36\times250\times7{,}677 = 691\ kN$

$\phi V_y = 0.9\times691 = 622$ kN

The pipe is symmetric, thus $\phi V_z = \phi V_y$

Check for Axial Compression

Section Compression Capacity:

Gross Area, $A_g = 7{,}677\ mm^2$

Net Area, $A_n = 7{,}677\ mm^2$

Form factor, $K_f = A_e/A_g = 1.0$

The nominal member section capacity for axial compression,

$N_s = K_f \times A_n \times f_y = 1.0\times7{,}677\times250 = 1{,}919$ kN [Ref : Clause 6.2.1]

$\phi N_s = 0.9\times1{,}919 = 1{,}727$ kN

Member Compression Capacity

Length of the member, $L = 9{,}000\ mm$

Effective length factor for slenderness & buckling about minor Y- axis, $K_y = 1.0$

Effective length factor for slenderness & buckling about minor Z- axis, $K_z = 1.0$

Effective Length of member, L_{ez} = *1.0×9,000 mm = 9,000 mm*

Effective Length of member, L_{ey} = *1.0×9,000 mm = 9,000 mm*

$r_y = r_z = \sqrt{(41.62\times10^6 / 7,677)} = 73.63$

Geometrical Slenderness Ratio = $L_{ey}/r_y = L_{ez}/r_z$ = *9,000 / 73.63 = 122.2*

Member slenderness,

$$\lambda_n = \frac{L_e}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 122.2\sqrt{1}\sqrt{\frac{250}{250}} = 122.2$$ [Ref : Clause 6.3.3]

$\alpha_a = 2,100\times(\lambda_{nz} - 13.5)/(\lambda_{nz}^2 - 15.3\lambda_{nz} + 2,050) = 15.10$

$\alpha_b = -1.0$ [Ref : Table 6.3.3(2)]

$\lambda = \lambda_n + \alpha_a\times\alpha_b = 107.1$

$\eta = 0.3$

$\xi_y = \xi_z = ((\lambda_z/90)^2 + 1 + \eta)/(2\times(\lambda_z/90)^2) = 1$

$\alpha_{cy} = \alpha_{cz} = 0.495$

The nominal member capacity,

$N_{cy} = N_{cz} = \alpha_{cz}\times N_s = 0.495\times1,919 = 950$ kN [Ref : Clause 6.3.3]

$\phi N_{cy} = \phi N_{cz} = 855$ kN

<u>Nominal Section tension Capacity</u>

[Ref : Clause 7.1]

$K_{te} = 1.00$

$N_{t1} = A_g\times f_y = 7,677 \times 250\times10^{-3} = 1,919$ kN

$N_{t2} = 0.85\times K_{te}\times A_n\times f_u = 0.85(1.0)(7,677)(250\times10^{-3}) = 1,631$ kN

$\phi N_t = 0.9\times1,919 = 1,727$ kN [Ref : Clause 5.6.1.1.1(a)]

Results

   ---------     -------------     ---------------
      X/x             Z/z          Longitudinal axis of section
      Y/y             Y/y          Minor principal axis of section
      Z/z             X/x          Major Principal axis of section
   MEMBER DESIGN OUTPUT FOR PMEMBER     1
   DESIGN Notes
   ------------
   1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for
      that particular Load Case; i.e. analysis does not include second-order
effects.
   2. φ = 0.9 for all the calculations [NZS3404 Table 3.4]
   3. (#) next to Young's modulus E indicates that its value is not 200000
MPa as per NZS3404 1.4.

V.NZS3404 1997-Tube Section Non Compact

Verify the design capacity of a pipe section per the NZS3404 1997 code.

Details

Verify the capacity of a PIP3239H member. Steel grade = 250 MPa. The simply supported span is 9 m with a 60 kN load at mid-span.

Validation

Section Classification

Evaluate the slenderness effects of the pipe member:

$$\lambda_{ef} = \frac{\mathrm{OD}}{t}\sqrt{\frac{f_y}{250}} = \frac{323.9}{6.3}\sqrt{\frac{250}{250}} = 51.41$$

Section classification is non-compact ($\lambda_{ey} = 120 > \lambda_{ef} > \lambda_{ep} = 50$)

Section Bending Capacity About Z-Axis

Effective Section Modulus for a compact section:

$$\min\left| \begin{array}{l} S_{xx} = 636 \times 10^3 \mathrm{mm}^3 \blacktriangleleft \\ 1.5 \times Z_{xx} = 1.5(489.6 \times 10^3)\mathrm{mm}^3 = 734.4 \times 10^3 \mathrm{mm}^3 \end{array}\right.$$

Effective section modulus for a non-compact section:

$$Z_e = Z + \frac{\lambda_{ey} - \lambda_{ef}}{\lambda_{ey} - \lambda_{ep}}(Z_c - Z_{xx}) = 489.6 + \frac{120 - 51.41}{120 - 50}(636 - 489.6) = 633.1 \times 10^3 \ \mathrm{mm}^3$$

The nominal section capacity in bending about Z axis, $\phi M_s = \phi f_y \times Z_e$

$$M_s = 250 \times 633.1 \times 10^3/10^6 = 158.3 \text{ kN·m}$$

$$\phi M_{sz} = 0.9 \times 158.3 = 142.4 \text{ kN·m}$$

Member Bending Capacity

End restraint arrangement = LL

A twist restraint factor, K_t (SKT) = 1.00

Minor axis rotation restraints = Both

Lateral rotation restraint factor, K_r (SKR) = 1.0

Load Height factor, Kl, (LHT) = 1.00 *[Ref : Table 5.6.3(2)]*

Effective length = 1×1×1×9,000 = 9,000 mm

$\alpha_m = 1$ [Ref: Cl no -5.6.1.1 (b)]

Reference buckling moment, M_o

$$M_o = \sqrt{\frac{\pi^2 E I_y}{L_e^2}\left[GJ + \left(\frac{\pi^2 E I_w}{L_e^2}\right)\right]}$$

$$= \sqrt{\frac{\pi^2 \times 250 \times 10^3 79.29 \times 10^6}{9,\ 000^2}\left[80,\ 000 \times 158.58 \times 10^6 + \left(\frac{\pi^2 \times 250 \times 10^3 79.29 \times 10^6}{9,\ 000^2}\right)\right]} = 5,\ 013 \text{ kN·m}$$

$\alpha_s = 1$ [Ref : Clause 5.6.1.1 (c)]

Member bending capacity, M_{bz}

$M_{bz} = \alpha_m \alpha_s M_{sz} \leq M_{sz}$

$M_{bz} = 1 \times 1 \times 158.2 = 158.3$ kN·m $\leq (M_{sz}, M_{sy})_{Max.}$ [Ref : Clause 5.6.1.1.1(a)]

$\phi M_{bz} = 0.9 \times 158.3 = 142.4$ kN·m

Check for Shear

Nominal shear capacity, V_z, of a circular hollow section: *[Ref. Cl no 5.11.4.2]*

$V_y = 0.36 \times f_y \times A_e = 0.36 \times 250 \times 6{,}290 \times 10^{-3} = 566.1$ kN

$\phi V_y = 0.9 \times 566.1 = 509.5$ kN

Nominal shear capacity, V_y, of a circular hollow section: *[Ref. Cl no 5.12.2]*

Design bending moment, $M = 135\ kN \cdot m$

$0.75 \times \phi \times M_s \leq M \leq \phi \times M_s$

$0.75 \times 142.4 = 106.8$ kN·m

$$V_y = V_v\left[2.2 - \left(\frac{1.6 \times M}{\phi M_S}\right)\right] = 566.1 \times \left[2.2 - \left(\frac{1.6 \times 135}{142.4}\right)\right] = 386.9 \text{ kN}$$

$\phi V_y = 0.9 \times 386.9 = 348.3$ kN

Check for Axial Capacity

Section Compression Capacity:

Gross Area, $A_g = 6{,}290\ mm^2$

The effective outside diameter is the minimum of d_{e1}, d_{e2}, and d_o:

$$d_{e1} = d_o\sqrt{\frac{\lambda_{ey}}{\lambda_e}} = 409.1 \text{ mm}$$

$$d_{e2} = d_o\left(\frac{3 \times \lambda_{ey}}{\lambda_e}\right)^2 = 7,\ 415 \text{ mm}$$

The effective outside diameter = $d_o = 323.9\ mm$

Net Area, $A_n = 6{,}290\ mm^2$

Form factor, $K_f = A_e/A_g = 1.0$

The nominal member section capacity for axial compression,

$N_s = K_f \times A_n \times f_y = 1.0 \times 6{,}290 \times 250 = 1{,}573$ kN [Ref : Clause 6.2.1]

$\phi N_s = 0.9 \times 1{,}573 = 1{,}415$ kN

Member Compression Capacity

Length of the member, $L = 9{,}000\ mm$

Effective length factor for slenderness & buckling about minor Y- axis, $K_y = 1.0$

Effective length factor for slenderness & buckling about minor Z- axis, $K_z = 1.0$

Effective Length of member, $L_{ez} = 1.0 \times 9{,}000\ mm = 9{,}000\ mm$

Effective Length of member, $L_{ey} = 1.0 \times 9{,}000\ mm = 9{,}000\ mm$

$$r_y = r_z = \sqrt{79.29 \times 10^6 / 6,\ 290} = 112.3 \text{ mm}$$

Geometrical Slenderness Ratio = $L_{ey}/r_y = L_{ez}/r_z = 9{,}000 \ / \ 112.3 = 80.13$

Member slenderness,

$$\lambda_n = \frac{L_e}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 80.13\sqrt{1}\sqrt{\frac{250}{250}} = 80.13$$ [Ref : Clause 6.3.3]

$$\alpha_a = 2,\ 100\frac{\lambda_{nz} - 13.5}{\lambda_{nz}^2 - 15.3\lambda_{nz} + 2,\ 050} = 19.31$$

$\alpha_b = -0.5$ [Ref : Table 6.3.3(2)]

$\lambda = \lambda_n + \alpha_a \times \alpha_b = 70.48$

$\eta = 0.19$

$$\xi_y = \xi_z = \frac{(\lambda_z / 90)^2 + 1 + \eta}{2 \times (\lambda_z / 90)^2} = \frac{(70.48 / 90)^2 + 1 + 0.19}{2 \times (70.48 / 90)^2} = 1.47$$

$$\alpha_{cz} = \xi_z\left[1 + \sqrt{1 - \left(\frac{90}{\xi_z \times \lambda_z}\right)^2}\right] = 0.74$$

The nominal member capacity,

$N_{cy} = N_{cz} = \alpha_{cz} \times N_s = 0.74 \times 1{,}573 = 1{,}171$ kN [Ref : Clause 6.3.3]

$\phi N_{cy} = \phi N_{cz} = 1{,}054$ kN

<u>Nominal Section tension Capacity</u>

[Ref : Clause 7.1]

$K_{te} = 1.00$

$N_{t1} = A_g \times f_y = 6{,}290 \times 250 \times 10^{-3} = 1{,}573$ kN

$N_{t2} = 0.85 \times K_{te} \times A_n \times f_u = 0.85(1.0)(6{,}290)(250 \times 10^{-3}) = 1{,}711$ kN

$\phi N_t = 0.9 \times 1{,}573 = 1{,}415$ kN [Ref : Clause 5.6.1.1.1(a)]

Results

V. NZS3404 1997-UB Section

Verify the Design Capacity of I Section as per NZS3404 1997.

Details

Verify the section bending capacity of an UB530X92.4. The member is used in a 15 m simply supported span..

Validation

<u>Section Classification</u>

Evaluate the slenderness the beam flanges:

$$\lambda_{ef} = (B/2t_f) \times \sqrt{(f_y/250)} = 198.8/ (2\times15.60)\times\sqrt{(300/250)} = 6.98 < 8$$

Flange is compact.

Evaluate the slenderness of the beam web:

$$\lambda_{ew} = (d/t_w) \times\sqrt{(f_y/250)} = 501.80/10.20\times\sqrt{(300/250)} = 53.89 < 89$$

Web is compact.

Bending Capacity

<u>Section Bending Capacity About Strong Axis</u>

Effective section modulus, $Z_{ez} = 2.37(10)^6\ mm^3$

The nominal section capacity in bending about the Z axis, $M_{sz} = \phi f_y \times Z_{ez}$

$$M_{sz} = 0.9 \times 300 \times 2.37 = 639.9 \text{ kN·m}$$

Section Bending Capacity About Weak Axis

Effective section modulus, $Z_{ey} = 341.6(10)^3\ mm^3$

The nominal section capacity in bending about the Y axis, $M_{sy} = \phi f_y \times Z_{ey}$

$$M_{sy} = 0.9 \times 300 \times 341.6\ (10)^{-3} = 92.24 \text{ kN·m}$$

Member Bending Capacity

End restraint arrangement = FF

A twist restraint factor, $K_t(SKT) = 1.00$

Minor axis rotation restraints = Both

Lateral rotation restraint factor, $K_r(SKR) = 1$

Load Height factor, $K_l,(LHT) = 1.00$ (Table 5.6.3(2) of NZS3404:1997)

Effective length = $1 \times 1 \times 1 \times 15{,}000 = 15{,}000\ mm$

Design Bending Moment, $Mm = 160.8\ kN{\cdot}m$

Quarter Point Moment of segment, $M_2 = -72.443\ kN{\cdot}m$

Mid-Point Moment of segment, $M_3 = -2.267\ kN{\cdot}m$

Quarter Point Moment of segment, $M_4 = 72.499\ kN{\cdot}m$

$$\alpha_m = \frac{1.7M_m^{\times}}{\sqrt{\left(M_1^*\right)^2 + \left(M_2^*\right)^2 + \left(M_3^*\right)^2}} \leq 2.5$$

$$\alpha_m = \frac{1.7 \times 160.8}{\sqrt{(-72.44)^2 + (-2.267)^2 + (72.5)^2}} = 2.66$$

Therefore, $\alpha_m = 2.5$

Reference Buckling Moment, M_o

$$M_o = \sqrt{\left(\frac{\pi^2 EI_y}{L_e^2}\right)\left[GJ + \left(\frac{\pi^2 EI_y}{L_e^2}\right)\right]} = 127.0 \text{ kN·m}$$

$$\alpha_s = 0.6\left\{\sqrt{\left[\left(\frac{M_{sx}}{M_{oa}}\right)^2 + 3\right]} - \left(\frac{M_{sx}}{M_{oa}}\right)\right\} = 0.157$$ [Ref. cl 5.6.1.1(c)]

$$M_{bz} = \alpha_m \alpha_s M_{sx} \leq M_{sx} = 2.5 \times 0.157 \times 71 = 279.1 \text{ kN·m}$$

$$\phi M_{bz} = 251.2 \text{ kN·m}$$

Check for Shear

Shear Area of the section, $A_y = d \times t_w = 533.0 \times 10.2 = 5{,}436.6\ mm^2$

Section Shear Capacity (Along Y axis), $V_y = 0.6 \times f_y \times A_y = 0.6 \times 320 \times 5{,}436.6 = 1{,}044\ kN$

$ZV_y = 0.9 \times 1{,}044 = 939.4$ kN

Shear Area of the section, $A_Z = 2 \times b_f \times t_f = 2 \times 209 \times 15.6 = 6{,}520.8\ mm^2$

Section Shear Capacity (Along z axis), $Vz = 0.6 \times fy \times Az = 0.6 \times 300 \times 6{,}520.8 = 1{,}174\ kN$

ϕV_z = 1,056 kN

Check for Axial Compression

<u>Section Compression Capacity</u>

The flange slenderness, $\lambda_{eb} = 6.98$ [Ref : Cl no - 6.2.3.1]

Yield slender for flange, $\lambda_{eby} = 16.00$ [Ref : Table 6.2.4]

The web slenderness, $\lambda_{ew} = 55.66$

Yield slender for web, $\lambda_{eby} = 45$

Effective Width, b_e=$209\ mm$

Effective Depth, DE=$405.7\ mm$

Gross Area, $A_g = 11{,}800\ mm^2$

Net Area, $A_n = 10{,}820\ mm^2$

Form factor, $K_f = A_e / A_g = 0.917$

The nominal member section capacity for axial compression ,

$N_s = K_f \times A_n \times f_y = 0.917 \times 10{,}819.8 \times 300 = 3{,}246$ kN [Ref : Cl no - 6.2.1]

$\phi N_s = 0.9 \times 3{,}246 = 2{,}920$ kN [Ref : Cl no - 6.2.1]

<u>Member Compression Capacity</u>

Effective length factor for slenderness & buckling about minor Y- axis, $Ky = 1.00$

Effective length factor for slenderness & buckling about minor Z- axis, $Kz = 1.00$

Effective Length of member, $L_{ez} = 15{,}000\ mm$

Effective Length of member, $L_{ey} = 15{,}000\ mm$

Geometrical Slenderness Ratio = 69.23

Geometrical Slenderness Ratio = 334.0

Member slenderness, $\lambda_{nz} = (L_e / r) \times \sqrt{(k_f)} \times \sqrt{(f_y / 250)}$ [Ref : Cl no - 6.3.3.]

$\lambda nz = 69.23 \times \sqrt{1} \times \sqrt{(300/250)} = 72.62$

Member slenderness, $\lambda_{ny} = (L_{ey} / r) \times \sqrt{(k_f)} \times \sqrt{(f_y / 250)}$ [Ref : Cl no - 6.3.3]

$\lambda_{ny} = 334 \times \sqrt{1} \times \sqrt{(300/250)} = 350.35$

$\alpha_{az} = 2{,}100 \times (\lambda_{nz} - 13.5)/(\lambda_{nz}^2 - 15.3\lambda_{nz} + 2{,}050) = 19.984$

$\alpha_{ay} = 2{,}100 \times (\lambda_{ny} - 13.5)/(\lambda_{ny}^2 - 15.3\lambda_{ny} + 2{,}050) = 5.923$

$\alpha_b = 0.00$ [Ref : table 6.3.3(2)]

$\lambda_z = \lambda_{nz} + \alpha_{ax}\alpha_b = 72.62$

$\lambda_y = \lambda_{ny} + \alpha_{ay}\alpha_b = 350.35$

$\eta = 0.19$

$\eta = 1.10$

$\xi_z = ((\lambda_z/90)2+1+\eta)/(2 \times (\lambda_z/90)2) = 1.42$

$\xi_y = ((\lambda_y/90)2+1+\eta)/(2\times(\lambda_y/90)2) = 0.57$

α_{cz}=0.731 [Ref : Cl no - 6.3.3]

α_{cy}=0.061 [Ref : Cl no - 6.3.3]

The nominal member capacity, $N_{cz}= \alpha_{cz} \times N_s$ [Ref : Cl no - 6.3.3]

$N_{cz}= \alpha_{cz} \times N_s$ =0.731×3,246 =2,373 kN

ϕNcz= 2,136 kN

The nominal member capacity, $N_{cy}= \alpha_{cy} \times N_s$ [Ref : Cl no - 6.3.3]

$N_{cy}= \alpha_{cy} \times N_s$ =0.061×3,246 = 198.9 kN

ϕN_{cy}= 178.96 KN

Nominal Section Tension Capacity

Ref. Cl 7.1

K_{te}= 1.00

Nt1 = $A_g \times f_y$ = 3,540 kN

Nt2 = $0.85\times K_{te}\times A_n\times f_u$ = 4,413 kN

ϕNt = 3,186 kN [Ref : Cl no -5.6.1.1.1(a)]

Results

                     STAAD.PRO CODE CHECKING - NZS-3404-1997 (v1.0)
                   **************************************************
   AXIS NOTATION FOR ANY SECTION OTHER THAN ST ANGLE:-
   STAAD.Pro     NZS3404 Spec.     Description
   ---------     -------------     ----------------
      X/x             Z/z          Longitudinal axis of section
      Y/y             Y/y          Minor principal axis of section
      Z/z             X/x          Major Principal axis of section
   MEMBER DESIGN OUTPUT FOR PMEMBER     5
   DESIGN Notes
   ------------
   1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for
      that particular Load Case; i.e. analysis does not include second-order
effects.
   2. φ = 0.9 for all the calculations [NZS3404 Table 3.4]
   3. (#) next to Young's modulus E indicates that its value is not 200000
MPa as per NZS3404 1.4.
   DESIGN SUMMARY
   --------------
   Designation: ST   UB530X92.4               (AISC SECTIONS)
   Governing Load Case:     1*
   Governing Criteria: Cl.
12.8.3.1.1
   Governing Ratio:  14.910 *(FAIL)
   Governing Location:  10.015 m from Start.

V.NZS3404 1997-Unequal Angle Section

Verify the design capacity of an A125x75x8 section as per the NZS3404 1997 code.

Details

Verify the section capacity of an A125x75x8 section used for a 5 m cantilever span. Steel grade = 320 MPa.

Validation

<u>Section Classification</u>

Evaluate the slenderness effects of the beam flanges:

$$\lambda_{ef} = \frac{B}{2t_f}\sqrt{\frac{f_y}{250}} = \frac{117.2}{7.8}\sqrt{\frac{320}{250}} = 17.0$$

Section flange classification is compact.

Evaluate the slenderness effects of the beam web:

$$\lambda_{ew} = \frac{d}{t_w}\sqrt{\frac{f_y}{250}} = \frac{67.2}{7.8}\sqrt{\frac{320}{250}} = 9.75$$

Section web classification is compact

<u>Section Bending Capacity About Z-Axis</u>

Effective Section Modulus, $Z_{ez} = 12{,}720\ mm^3$

The nominal section capacity in bending about Z axis, $M_{sz} = \phi f_y \times Z_{ez}$

M_{sz} = 320× 12,720 ×10^{-6} = 4.07 kN·m

ϕM_{sz} = 0.9×4.07 = 3.66 kN·m

<u>Section Bending Capacity About Y-Axis</u>

Effective Section Modulus, Z_{ey} = *40,550 mm*^{3}

The nominal section capacity in bending about Z axis, $M_{sy} = \phi f_y \times Z_{ey}$

M_{sy} = 320× 40,550×10^{-6} = 12.98 kN·m

ϕM_{sy} = 0.9×12.98 = 11.68 kN·m

<u>Member Bending Capacity</u>

End restraint arrangement = FU

A twist restraint factor, K_t (SKT) = 1.00

Minor axis rotation restraints = Fu

Lateral rotation restraint factor, K_r (SKR) = 0.70

Load Height factor, Kl, = 2.0 *[Ref : Table 5.6.3(2)]*

Effective length = 1×1×2×5,000 = 10,000 mm

α_m = 1.25

Reference buckling moment, M_o

$$M_o = \sqrt{\frac{\pi^2 E I_y}{L_e^2}\left[GJ + \left(\frac{\pi^2 E I_w}{L_e^2}\right)\right]} = 4.43 \text{ kN·m}$$

$$\alpha_s = 0.6\left\{\sqrt{\left[\left(\frac{M_{sx}}{M_{oa}}\right)^2 + 3\right]} - \left(\frac{M_{sx}}{M_{oa}}\right)\right\} = 0.284$$ [Ref : Clause 5.6.1.1 (c)]

$M_{bx} = \alpha_m \alpha_s M_{sx} \le M_{sx}$

M_{bz} = 1.25 × 0.284 × 12.98 = 4.61 kN·m ≤ $(M_{sz}, M_{sy})_{Max.}$ [Ref : Clause 5.6.1.1.1(a)]

ϕM_{bz} = 0.9×4.61 = 4.15 kN·m

<u>Check for Shear</u>

Shear Area of the section, $A_y = d \times t$ = *125×7.8 = 975 mm*^{2}

Section Shear Capacity (Along Y axis), $V_y = 0.6 \times f_y \times A_y$ = *0.6×320×975 = 187 kN*

V_{vn} = 2×187/(0.9 + 1.2) = 178 kN [Ref : Clause 5.11.2]

ϕV_y = 0.9×178 = 133.2 kN

Shear Area of the section, $A_Z = b \times t$ = *75×7.8 = 585 mm*^{2}

Section Shear Capacity (Along z axis), $V_z = 0.6 \times f_y \times A_z$ = *0.6×320×585 = 112.3 kN*

V_{vn} = 2×112.3/(0.9 + 1.2) = 107 kN

ϕV_z = 0.9×107 = 96.3 kN

<u>Check for Axial Compression</u>

Section Compression Capacity:

Gross Area, A_g = *1,500 mm*^{2}

Net Area, $A_n = 1,500\ mm^2$

Form factor, $K_f = A_e / A_g = 1.0$

The nominal member section capacity for axial compression,

$N_s = K_f \times A_n \times f_y = 1.0\times1,500\times320 = 480$ kN [Ref : Clause 6.2.1]

$\phi N_s = 0.9\times480 = 432$ kN

Member Compression Capacity

Length of the member, $L = 5,000\ mm$

Effective length factor for slenderness & buckling about minor Y- axis, $K_y = 2.2$

Effective length factor for slenderness & buckling about minor Z- axis, $K_z = 2.2$

Effective Length of member, $L_{ez} = 2.2\times5,000\ mm = 11,000\ mm$

Effective Length of member, $L_{ey} = 2.2\times5,000\ mm = 11,000\ mm$

$r_y = \sqrt{}(2.72\times10^6 / 1,500) = 42.6$

$r_z = \sqrt{}(398\times10^3 / 1,500) = 16.3$

Geometrical Slenderness Ratio = $L_{ez}/r_z = 11,000\ /\ 16.3 = 674.9$

Geometrical Slenderness Ratio = $L_{ey}/r_y = 11,000\ /\ 42.6 = 258.3$

Member slenderness,

$$\lambda_{nz} = \frac{L_{ez}}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 674.9\sqrt{1}\sqrt{\frac{320}{250}} = 763.5$$ [Ref : Clause 6.3.3]

$$\lambda_{ny} = \frac{L_{ey}}{r}\sqrt{k_f}\sqrt{\frac{f_y}{250}} = 258.3\sqrt{1}\sqrt{\frac{320}{250}} = 291.9$$ [Ref : Clause 6.3.3]

$\alpha_{az} = 2,100\times(\lambda_{nz} - 13.5)/(\lambda_{nz}^2 - 15.3\lambda_{nz} + 2,050) = 2.747$

$\alpha_{ay} = 2,100\times(\lambda_{ny} - 13.5)/(\lambda_{ny}^2 - 15.3\lambda_{ny} + 2,050) = 7.061$

$\alpha_b = 0.5$ [Ref : Table 6.3.3(2)]

$\lambda_z = \lambda_{nz} + \alpha_{az}\times\alpha_z = 764.9$

$\lambda_y = \lambda_{ny} + \alpha_{ay}\times\alpha_b = 295.5$

$\eta = 2.45$

$\eta = 0.92$

$\xi_z = ((\lambda_z/90)^2 + 1 + \eta)/(2\times(\lambda_z/90)^2) = 0.52$

$\xi_y = ((\lambda_y/90)^2 + 1 + \eta)/(2\times(\lambda_y/90)^2) = 0.59$

$\alpha_{cz} = 0.013$

$\alpha_{cy} = 0.085$

The nominal member capacity,

$N_{cz} = \alpha_{cz}\times N_s = 0.013\times480 = 6.42$ kN [Ref : Clause 6.3.3]

$\phi N_{cz} = 5.78$ kN

The nominal member capacity,

$N_{cy} = \alpha_{cy} \times N_s = 0.085 \times 480 = 40.7$ kN [Ref : Clause 6.3.3]

$\phi N_{cy} = 36.66$ kN

Nominal Section tension Capacity

[Ref : Clause 7.1]

$K_{te} = 1.00$

$N_{t1} = A_g \times f_y = 480$ kN

$N_{t2} = 0.85 \times K_{te} \times A_n \times f_u = 516$ kN

$\phi N_t = 0.9 \times 480 = 432$ kN [Ref : Clause 5.6.1.1.1(a)]

   AXIS NOTATION FOR ST ANGLE SECTION:-
   STAAD.Pro     NZS3404 Spec.     Description
   ---------     -------------     ---------------
      X/x             Z/z          Longitudinal axis of section
      Y/y             X/x          Major principal axis of section
      Z/z             Y/y          Minor Principal axis of section
   MEMBER DESIGN OUTPUT FOR PMEMBER     1
   DESIGN Notes
   ------------
   1. (*) next to a Load Case number signifies that a P-Delta analysis has
not been performed for
      that particular Load Case; i.e. analysis does not include second-order
effects.
   2. φ = 0.9 for all the calculations [NZS3404 Table 3.4]
   3. (#) next to Young's modulus E indicates that its value is not 200000
MPa as per NZS3404 1.4.

V. Russia

V.SNiP SP16 2011 - I Section with Axial Load

Verify the design capaciy of an I section used in a column per the SP16.13330.2011 code.

Details

The column is 7.5 m tall with a pinned base and a roller (free to move vertically and rotate) at the top. The column has a 3,500 kN axial load. The section used is an HD320X127. Steel grade is S235.

$E = 205{,}000\ MPa$
$R_y = 235\ MPa$ (yield strength)
$\gamma_{c1} = 1, \gamma_{c2} = 1$

Validation

Check for Axial Force

$$\frac{N}{A_n \times R_y \times \gamma_c} \leq 1 \qquad \text{[Cl. 7.1.1, Eqn. 5]}$$

$$\frac{3{,}500}{161\left(10^{-4}\right) \times 235\left(10^{3}\right) \times 1.0} = 0.925 \leq 1 \text{ (OK)}$$

$$\frac{N}{\phi \times A \times R_y \times \gamma_c} \leq 1 \qquad \text{[Cl. 7.1.3, Eqn. 7]}$$

where

A = cross sectional area = $161\ cm^2$

Slenderness ratios:

$$K_y = K_x = 0.75$$

$$\lambda_x = \frac{K_x L}{r_x} = \frac{0.75 \times 7.5}{0.138} = 40.76$$

$$\lambda_y = \frac{K_y L}{r_y} = \frac{0.75 \times 7.5}{0.0757} = 74.3$$

$$\bar{\lambda}_x = \lambda_x \sqrt{\frac{R_y}{E}} = 40.76\sqrt{\frac{235}{205,\ 000}} = 1.38$$

$$\bar{\lambda}_y = \lambda_y \sqrt{\frac{R_y}{E}} = 74.3\sqrt{\frac{235}{205,\ 000}} = 2.516$$

$$\phi = 0.5\frac{\partial - \sqrt{\partial^2 + 39.48 \times \bar{\lambda}^2}}{\bar{\lambda}^2} \qquad \text{[Eqn. 8]}$$

$$\partial = 9.87 \times \left(1 - \alpha + \beta \times \bar{\lambda}\right) + \bar{\lambda}^2 \qquad \text{[Eqn. 9]}$$

where

α = 0.04 (From Table 7)

β = 0.09 (From Table 7)

$\bar{\lambda}$ = 2.516 (maximum slenderness ratio)

$$\partial = 9.87 \times \left[1 - 0.04 + 0.09 \times (2.516)\right] + (2.516)^2 = 18.04$$

$$\phi = 0.5 \frac{18.04 - \sqrt{(18.04)^2 + 39.48 \times (2.516)^2}}{(2.516)^2} = 0.7385 < \frac{7.6}{\lambda^2} = 1.2006 \text{ (OK)}$$

$$\frac{N}{\phi \times A \times R_y \times \gamma_c} = \frac{3,\ 500}{0.7385 \times 0.0161 \times 235\left(10^3\right) \times 1.0} = 1.25 > 1$$

Check Web Slenderness

$$h_{ef} = D - 4T_f = 320 - 4 \times 20.5 = 238 \text{ mm}$$

$$\bar{\lambda}_w = \frac{h_{ef}}{T_w}\sqrt{\frac{R_y}{E}} = \frac{238}{11.5}\sqrt{\frac{235}{205,\ 000}} = 0.700$$

$$\bar{\lambda}_{uw} = 1.2 + 0.35\bar{\lambda} = 1.2 + 0.35(2.516) = 2.08 \qquad \text{[Table 9; Eqn. 24]}$$

$$\bar{\lambda}_w < \bar{\lambda}_{uw} \text{ (OK)}$$

Check Flange Slenderness

$$b_{ef} = \frac{1}{2}\left(B - 2T_w\right) = \frac{1}{2}\left(300 - 4 \times 11.5\right) = 127 \text{ mm}$$

$$\bar{\lambda}_f = \frac{b_{ef}}{T_f}\sqrt{\frac{R_y}{E}} = \frac{127}{20.5}\sqrt{\frac{235}{205,\ 000}} = 0.210$$

$$\bar{\lambda}_{uf} = 0.36 + 0.1\bar{\lambda} = 0.36 + 0.1(2.516) = 0.612 \qquad \text{[Table 10; Eqn. 37]}$$

$$\bar{\lambda}_f < \bar{\lambda}_{uf} \text{ (OK)}$$

Results

- *D13.C.2 Member Capacities* (on page 1906)

V.SNiP SP16 2011 - I Section with UDL

Verify the design capacity per SP16.13330.2011 of an I section subject to a uniformly distributed load.

Details

Uniformly distributed load of 100 kN/m along the entire span. Member is simply supported span 5m in length. Section used is an HD320x127.

Grade of Steel: S235 - $E = 206{,}000\ MPa, f_y = 235\ MPa, \gamma_{c1} = 1.1, \gamma_{c2} = 1.1$

Validation

Check for Flexure

$$\frac{M}{W_{n,min} R_y \gamma_c} \le 1$$ [Eqn. 41 of SNiP SP16.13330.2011]

where

M	=	312.5
$W_{n,min}$	=	$W_x = 1{,}926.5\ cm^3$
R_y	=	235 MPa

$$\frac{M}{W_{n,min}R_y\gamma_c} = 0.628 \le 1 \text{ (OK)}$$

Check for Shear

$$\frac{QS}{It_w R_s\gamma_c} \le 1 \qquad \text{[Eqn. 42 of SNiP SP16.13330.2011]}$$

where

Q	=	$q.l/2 = 250\ kN$
S	=	1,070 cm^3
I	=	30,820 cm^4
R_s	=	0.58×235 MPa
t_w	=	11.5 mm

$$\frac{QS}{It_w R_s\gamma_c} = 0.5034 \le 1 \text{ (OK)}$$

Check for Lateral Torsional Buckling

$$\frac{M_x}{\phi_b W_{cx} R_y\gamma_c} \le 1 \qquad \text{[Eqn. 43 of SNiP SP16.13330.2011]}$$

where

α = $1.54\frac{I_t}{I_y}\left(\frac{l_{ef}}{h}\right)^2 = 9.1603$ [From Eqn. G.4]

$0.1 \le \alpha \le 40$ so from Table G.1:

$\psi = 1.6 + 0.08\alpha = 2.333$

ϕ_1 = $\psi\frac{I_y}{I_x}\left(\frac{h}{l_{ef}}\right)^2\frac{E}{R_y} = 0.00078 < 0.85$

from Table G.3: $\phi_b = 0.68 + 0.21\phi_1 = 1.2073 \ge 1.0$ so use $\phi_b = 1.0$

$$\frac{M_x}{\phi_b W_{cx} R_y\gamma_c} = \frac{312.5}{1.0 \times 1{,}926.5\left(10^{-6}\right) \times 235\left(10^{3}\right) \times 1.1} = 0.628 \le 1 \text{ (OK)}$$

Check for Combined Shear & Flexure

$$\frac{0.87}{R_y\gamma_c}\sqrt{\sigma_x^2 - \sigma_x\sigma_y + \sigma_y^2 + 3\tau_{xy}^2} \le 1 \qquad \text{[Eqn. 44 of SNiP SP16.13330.2011]}$$

where

σ_x	=	$M / W_x = 312.5\times10^3 / 1{,}926.5 = 162.2\ MPa$
σ_y	=	0 (No weak axis bending)
τ_{xy}	=	$QS / (I \times t_w) = 0\ MPa$

Note: Moment is maximum at mid-span, where shear is zero.

$$\frac{0.87}{235 \times 1.1}\sqrt{162.2^2} = 0.55 \le 1 \text{ (OK)}$$

From Table 11 of SP16 code:

$\lambda_{ub} = 0.35 + 0.0032\times b/t + (0.76\text{-}0.02\times b/t)\times b/h = 0.35 + 0.0032\times300/20.5 + (0.76\text{-}0.02\times300/20.5)\times1.0016 = 0.865$ [Eqn. 73]

$$\lambda_b = \frac{l_{ef}}{b}\sqrt{\frac{R_y}{E}} = 0.5629$$

$\lambda_b \leq \lambda_{ub}$, OK

Check for Deflection

$$f_{\max} = \frac{5}{384}\frac{ql^4}{EI_x} = \frac{5}{384}\frac{100 \times 5^4}{206{,}000 \times 10^3 \times 30{,}820 \times 10^{-8}} = 0.0128 \text{ m}$$

Maximum member deflect = $L/200 = 0.025\ m$

Ratio = $0.0128\ /\ 0.025 = 0.512$

Results

Table 701: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Cl. 8.2.1 (41)	0.628	0.63	Negligible	
Cl. 8.2.1 (44)	0.55	0.55	None	
F.69	0.628	0.628	None	
Max deflection	0.025	0.025	None	
Deflection	0.0128	0.0128	None	
Deflection ratio	0.512	0.512	None

V. SNiP SP16 2017 - Channel section with UDL

Design an channel section subjected to a uniform distributed load per the SP 16.13330.2017 code.

Details

A 5m long, simply supported beam has an American C15X50 section. The beam is subjected to a uniform distributed load of 100 kN/m in the Y direction. The steel used has a modulus of elasticity of 206,000 MPa and a $R_{yn} = 235$ MPa. $\gamma_{c1} = 1.1$, $\gamma_{c2} = 1.1$

Validation

$$R_y = R_{yn} / \gamma_m = 223.8 \text{ MPa}$$

$$R_s = 0.58 \times R_y / \gamma_m = 129.8 \text{ MPa}$$

Check for Flexure

Need to satisfy the following equation:

$$\frac{M}{W_{n,\min} R_y \gamma_c} \leq 1 \quad \text{(Eq. 41)}$$

where

M = $100 (5)^2 / 8 = 312.5$ kN·m
$W_{n,min}$ = $W_x = 883$ cm^3

Thus, the ratio is $\frac{312.5}{883(10)^{-3} \times 235 \times 1.1} = 1.37 > 1$

<u>Check for Shear</u>

Need to satisfy the following equation:

$$\frac{QS}{It_w R_s \gamma_c} \le 1 \qquad \text{(Eq. 42)}$$

where

Q = $0\ kN$

Thus, the ratio is $0.0 < 1$

<u>Check for Combined Flexure & Shear</u>

Need to satisfy the following equation:

$$\frac{0.87}{R_y \gamma_c}\sqrt{{\sigma_x}^2 - \sigma_x \sigma_y + {\sigma_y}^2 + 3{\tau_{xy}}^2} \le 1 \qquad \text{(Eq. 44)}$$

where

σ_x = $M / W_x = 312.5 (10)^3 / 883 = 353.9\ MPa$

σ_y = $0\ MPa$

τ_{xy} = $0\ MPa$

Thus, the ratio is $\frac{0.87}{235 \times 1.1}\sqrt{(353.9)^2} = 1.19 > 1$

<u>Check for Stability</u>

Check per Cl. 8.4.4. From Table 11 of SP 16.13330-2017:

$$\bar{\lambda}_{ub} = 0.35 + 0.0032\frac{b}{t} + \left(0.76 - 0.02\frac{b}{t}\right)\frac{b}{h} \qquad \text{(Eq. 73)}$$

$$\bar{\lambda}_{ub} = 0.35 + 0.0032\frac{94.49}{16.51} + \left(0.76 - 0.02\frac{94.49}{16.51}\right)0.2593 = 0.536$$

$$\bar{\lambda}_b = \frac{l_{ef}}{b}\sqrt{\frac{R_y}{E}} = 1.787 > \bar{\lambda}_{ub}$$

So, the stability of the beam is *not* ensured per Cl. 8.4.4.b. Therefore a check per Cl 8.4.1 needs to be made.

<u>Check for Lateral-Torsional Buckling</u>

Need to satisfy the following equation:

$$\frac{M_x}{\phi_b W_{cx} R_y \gamma_c} \le 1 \qquad \text{(Eq. 69)}$$

$$\alpha = 1.54\frac{I_t}{I_y}\left(\frac{l_{ef}}{h}\right)^2 = 63.80 \qquad \text{(Eq. G.4)}$$

Since $\alpha > 40$, from Table G.1:

$$\psi = 3.15 + 0.04\alpha - 2.7(10)^{-5}\alpha^2 = 5.592$$

$$\phi_1 = \psi\frac{I_y}{I_x}\left(\frac{h}{l_{ef}}\right)^2\frac{E}{R_y} = 0.775$$

$$\phi_b = 0.7\phi_1 = 0.7(0.775) = 0.543$$

Thus, the ratio is $\frac{312.5}{0.543 \times 883(10)^{-3} \times 235 \times 1.1} = 2.52 > 1$

<u>Check for Deflection</u>

$$f_{\max} = \frac{5}{384}\frac{ql^4}{EI_x} = \frac{5}{384}\frac{100 \times 5^4}{206(10)^6 16,\ 816(10)^{-8}} = 0.0235 \text{ m}$$

The maximum member deflection is limited to $l\ /\ 200 = 0.025\ m$

Thus, the ratio is $0.0235\ /\ 0.025 = 0.94$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments

V. SNiP SP16 2017 - CLASS 2 Rolled I Section with Bi-Moment

Verify a rolled I section subjected to uniform distributed loads per the SP 16.13330.2017 code.

Details

A 6m long, simply supported beam has a UPT HE500A section. The beam is subjected to a uniform distributed load of 132.2 kN/m in the Y direction and a bi-moment of 10 kN·. The steel used has a modulus of elasticity of 206,000 MPa and a $R_{yn} = 235\ MPa$. $\gamma_m = 1.025$, $\gamma_c = 1$

Section Properties

$D = 490$ mm

$B = 300$ mm

$t_f = 23$ mm

$t_w = 12$ mm

$I_x = 84{,}054\ cm^4$

$I_y = 10{,}356\ cm^4$

$W_x = 3{,}431\ cm^3$

$W_y = 690.4\ cm^3$

Validation

$R_y = R_{yn}/\ \gamma_m = 229.3$ MPa

$R_s = 0.58 \times R_y/\ \gamma_m = 133.0$ MPa

Check for Flexure

As this is a Class 2 section (elasto-plastic), it must satisfy equation 53 from Cl. 8.2.3:

$$\frac{M_x}{c_x W_{x,\min} R_y \gamma_c} + \frac{B}{c_w W_{y,\min} R_y \gamma_c} \le 1 \qquad \text{(Eq. 53)}$$

where

M_x	=	$132.2\ (6)^2 / 8 = 594.9\ kN{\cdot}m$
β	=	1 per Eq. 52 (Cl. 8.2.3), as $Q_x = Q_y = 0$, and therefore $\tau_x = \tau_y = 0$
c_x	=	1.063 (from Table E.1); for $A_f / A_w = 69 / 53.28 = 1.295$
c_w	=	2.915 (from Table 10a)

Thus, the ratio is $\frac{594.9(10)^3}{1.063(3{,}431)(229.3)(1.0)} + \frac{10(10)^3}{2.915(690.4)(229.3)(1.0)} = 0.711 + 0.022 = 0.733$

Check for Stability

Check per Cl. 8.4.4. From Table 11 of SP 16.13330-2017:

$$\sigma_x = \frac{M_x}{W_c \times \gamma_c} = \frac{594.9}{3{,}431 \times (10)^{-3} \times 1} = 173.4 \text{ MPa}$$

$$\bar{\lambda}_{ub} = \left[0.35 + 0.0032\frac{b}{t} + \left(0.76 - 0.02\frac{b}{t}\right)\frac{b}{h}\right]\delta\sqrt{\frac{R_y}{\phi_x}}$$

Per Cl. 8.4.6, this value is multiplied by δ as indicated above, where:

$$\delta = 1 - 0.6\frac{(c_{1x} - 1)}{(c_x - 1)} \qquad \text{(Eq. 76)}$$

where

$$c_{1x} = \max \left| \begin{array}{l} M_x / \left(W_{xn} \times R_y \times \gamma_c\right) = \frac{594.9(10)^3}{3{,}431(229.3)(1.0)} = 0.756 \\ \beta c_x = 1.0 \times 1.063 = 1.063 \end{array} \right.$$

Therefore, since $c_{1x} = c_x$, $\delta = 1 - 0.6 = 0.4$

$$\bar{\lambda}_{ub} = \left[0.35 + 0.0032\frac{300}{23} + \left(0.76 - 0.02\frac{300}{23}\right)\frac{300}{490}\right]0.4\sqrt{\frac{229.3}{173.4}} = 0.328$$

$$\bar{\lambda}_b = \frac{l_{ef}}{b}\sqrt{\frac{R_y}{E}}\frac{6{,}000}{300}\sqrt{\frac{229.3}{206{,}000}} = 0.667 > \bar{\lambda}_{ub}$$

So, the stability of the beam is *not* ensured per Cl. 8.4.4.b.

Check for Deflection

$$f_y = \frac{5}{384}\frac{ql^4}{EI_x} = \frac{5}{384}\frac{132 \times 6^4}{206(10)^6 84{,}054(10)^{-8}} = 0.0129 \text{ m}$$

The maximum member deflection is limited to $l / 200 = 0.03\ m$

Thus, the ratio is $0.0129 / 0.03 = 0.429$

V. SNiP SP16 2017 - CLASS 2 UPT I section

Check the capacity of a user-provided table I section subject to biaxial moment per the SP 16.13330.2017 code.

Details

A 6m, simply supported beam uses a welded, built-up I section. The section is defined as Class 2 (elasto-plastic). The flanges are 300 mm × 23 mm; the total section depth is 490 mm; the web thickness is 12 mm. The steel used has a modulus of elasticity of 206,000 MPa and a $R_{yn} = 235\ MPa$. $\gamma_m = 1.025$. $\gamma_c = 1.0$

The member is subjected to uniformly distributed loads of 150 kN/m in the Y direction and 30 kN/m in the Z direction.

Validation

$$R_y = R_{yn}/\ \gamma_m = 229.3 \text{ MPa}$$

$$R_s = 0.58 \times R_y/\ \gamma_m = 133.0 \text{ MPa}$$

<u>Section Properties</u>

$$I_x = \frac{12(490 - 2 \times 23)^3}{12} + 2\left[\frac{300(23)^3}{12} + 300(23)\left(\frac{490}{2} - \frac{23}{2}\right)^2\right] = 84,\ 054 \text{ cm}^4$$

$$I_y = \frac{(490 - 2 \times 23)12^3}{12} + 2\left[\frac{23(300)^3}{12}\right] = 10,\ 356 \text{ cm}^4$$

$$W_x = \frac{84,\ 054(2)}{49} = 3,\ 431 \text{ cm}^3$$

$$W_x = \frac{10,\ 356(2)}{30} = 690.4 \text{ cm}^3$$

Check for Flexure

Ratio of area of the flange to the area of the web:

$$A_f / A_w = \frac{300 \times 23}{(490 - 2 \times 23)12} = 1.295$$

Need to satisfy the following equation from Cl. 8.2.3:

$$\frac{M_x}{c_x \beta W_{xn,\min} R_y \gamma_c} + \frac{M_y}{c_y \beta W_{yn,\min} R_y \gamma_c} \le 1 \qquad \text{(Eq. 51)}$$

where

M_x	=	$150\ (6)^2\ /\ 8 = 675\ kN{\cdot}m$
M_y	=	$30\ (6)^2\ /\ 8 = 135\ kN{\cdot}m$
β	=	1 per Eq. 52, as $Q_x = Q_y = 0$, and therefore $\tau_x = \tau_y = 0$
c_x	=	1.0611 (from Table E.1)
c_y	=	1.47 > 1.15, thus use 1.15

Thus, the ratio is $\frac{675}{1.061 \times 1 \times 3,\ 431 \times (10)^{-3} \times 229.3 \times 1} + \frac{135}{1.15 \times 1 \times 690.4 \times (10)^{-3} \times 229.3 \times 1} = 1.55 > 1$

Check for Stability

$$\phi_x = \frac{M_x}{W_c \times \gamma_c} = \frac{675}{3,\ 431 \times (10)^{-3} \times 1} = 196.7 \text{ MPa}$$

$$\bar{\lambda}_b = \frac{l_{ef}}{b}\sqrt{\frac{R_y}{E}} = \frac{6}{0.3}\sqrt{\frac{229.3}{206,\ 000}} = 0.667$$

$$\bar{\lambda}_{ub} = \left[0.35 + 0.0032\frac{b}{t} + \left(0.76 - 0.02\frac{b}{t}\right)\frac{b}{h}\right] \times \delta\sqrt{\frac{R_y}{\phi_x}} \qquad \text{(Eq. 76)}$$

Per Cl. 8.4.6, the value $\bar{\lambda}_{ub}$ is multiplied by δ.

where

δ	=	$1 - 0.6(c_{1x} - 1)\ /\ (c_x - 1)$
c_{1x}	=	is the larger of
		$\frac{M_x}{W_{xn} R_y \gamma_c} = \frac{675}{3,\ 431 \times (10)^{-3} 229.3 \times 1} = 0.858$, or $\beta c_x = 1.061$, so =1.061

$$\delta = 1 - 0.6\frac{1}{1} = 0.4$$

$$\bar{\lambda}_{ub} = \left[0.35 + 0.0032\frac{300}{23} + \left(0.76 - 0.02\frac{300}{23}\right)\frac{300}{490 - 23}\right] \times 0.4\sqrt{\frac{229.3}{196.7}} = 0.308 < \bar{\lambda}_b$$

So, the stability of the beam is *not* ensured per Cl. 8.4.4.b.

Check for Deflection

$$f_y = \frac{5}{384}\frac{ql^4}{EI_x} = \frac{5}{384}\frac{150 \times 6^4}{206(10)^6 84,\ 054(10)^{-8}} = 0.0237 \text{ m}$$

$$f_z = \frac{5}{384}\frac{ql^4}{EI_x} = \frac{5}{384}\frac{30 \times 6^4}{206(10)^6 10,\ 356(10)^{-8}} = 0.0146 \text{ m}$$

$$f_{\max} = \sqrt{(0.0237)^2 + (0.0146)^2} = 0.0279 \text{ m}$$

The maximum member deflection is limited to $l / 200 = 0.03 m$

Thus, the ratio is $0.0279 / 0.03 = 0.93$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
Ratio for flexure (Eq. 51)	1.55	1.55	none	
Deflection (m)	0.0279	0.02785	negligible	
Deflection ratio	0.93	0.93	none

V. SNiP SP16 2017 - Column in compression

Design a column per the SP 16.13330.2017 code.

Details

A 6.78 m tall, simply supported column has a Russian K2-30 section. The column is subject to a 1,500 kN axial load. The steel used has a modulus of elasticity of 206,000 MPa and a $R_y = 239\ MPa$. $\gamma_{c1} = 1$, $\gamma_{c2} = 1$

Section Properties

D = 300 mm

B = 300 mm

t_f = 15 mm

t_w = 10 mm

A = 119.78 cm^2

I_x = 20,410 cm^4

I_y = 6,755 cm^4

r_x = 13.05 cm

r_y = 7.51 cm

J = 76.5 cm^4

Validation

Check for Axial Force

Need to satisfy the following equation per Cl. 7.1.1:

$$\frac{N}{A_n R_y \gamma_c} \leq 1 \qquad \text{(Eq. 5)}$$

Thus, the ratio is $\frac{1,\ 500}{119.78 \times 10^{-1} \times 239 \times 1} = 0.524 < 1$

Check the slenderness per Cl. 10.4.1. Limit the slenderness to 120.

$$\lambda_x = \frac{k_x l}{r_x} = \frac{1.0 \times 6.78}{0.1305} = 51.94 < 120$$

$$\lambda_y = \frac{k_y l}{r_y} = \frac{1.0 \times 6.78}{0.0751} = 90.28 < 120$$

Thus, the ratio is $90.28\ /\ 120 = 0.75$

Check Cl. 7.1.3

$$\bar{\lambda}_x = \lambda_x \sqrt{\frac{R_y}{E}} = 51.94\sqrt{\frac{239}{206,\ 000}} = 1.769$$

$$\bar{\lambda}_y = \lambda_y \sqrt{\frac{R_y}{E}} = 90.28\sqrt{\frac{239}{206,\ 000}} = 3.075$$

Therefore, $\bar{\lambda} = 3.075$

Need to satisfy the following equation:

$$\frac{N}{\phi A R_y \gamma_c} \le 1 \qquad \text{(Eq. 7)(}$$

where

ϕ = $0.5\frac{\delta - \sqrt{\delta^2 - 39.48 \times \bar{\lambda}^2}}{\bar{\lambda}^2}$, per Eq. 8

δ = $9.87(1 - \alpha + \beta\bar{\lambda}) + \bar{\lambda}^2$, per Eq. 9

From Table 7, note 2, $\alpha = 0.04$ and $\beta = 0.14$.

$$\delta = 9.87[1 - 0.04 + 0.14(3.075)] + (3.075)^2 = 23.18$$

$$\phi = 0.5\frac{23.18 - \sqrt{(23.18)^2 - 39.48 \times (3.075)^2}}{(3.075)^2} = 0.549 < \frac{7.6}{\bar{\lambda}^2} = \frac{7.6}{(3.075)^2} = 0.804$$

Thus, the ratio is $\frac{1,\ 500}{0.549 \times 119.78 \times 10^{-1} \times 239 \times 1} = 0.955 < 1$

Check Cl. 7.3.2

Design height of the cross-section wall, $h_{ef} = 240\ mm$ (Cl. 7.3.1)

$$\bar{\lambda}_w = \frac{h_{ef}}{t_w}\sqrt{\frac{R_y}{E}} = \frac{240}{10}\sqrt{\frac{239}{206,\ 000}} = 0.818$$

Since $\bar{\lambda} = 3.075 > 2, \bar{\lambda}_{uw} = 1.20 + 0.35\bar{\lambda} = 2.276 < 2.3$ (per F.(24), Table 9)

$\bar{\lambda}_w < \bar{\lambda}_{uw}$, OK

Check Cl. 7.3.8

Design width of the cross-section wall, $b_{ef} = b/2 - 2 \times t_w = 130\ mm$

$$\bar{\lambda}_f = \frac{b_{ef}}{t_f}\sqrt{\frac{R_y}{E}} = \frac{130}{15}\sqrt{\frac{239}{206,\,000}} = 0.295$$

Since $\bar{\lambda} = 3.075 > 2, \bar{\lambda}_{uf} = 0.36 + 0.10\bar{\lambda} = 0.668$ (per F.(37), Table 10)

$\bar{\lambda}_f < \bar{\lambda}_{uf}$, OK

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\Russia\SNiP SP16 2017 - Column in compression.STD` is typically installed with the program.

The following design parameters are used:

- The slenderness for compression member is limited to 120 by the `CMN 2` parameter.
- The steel grade of S255B-1 (for K type sections) is specified by `SGR 20`.
- The stress strain state is indicated by `TB 1`.

V. SNiP SP16 2017 - Eccentrically Compressed Tube Section

Design a column subject to axial compressive force and biaxial moment per the SP 16.13330.2017 code.

Details

A 5 m tall, simply supported column has a TUB200X160X8 section. The column is subject to a 80 kN axial load along with a uniformly distributed load of 30 kN/m in the local X axis. The steel used has a modulus of elasticity of 206,000 MPa and a $R_y = 562\ MPa$. $\gamma_c = 1, \gamma_m = 1.05$

<u>Section Properties</u>

D = 200 mm

B = 160 mm

t = 8 mm

A = 52.84 cm^2

I_x = 2,975 cm^4

I_y = 2,110 cm^4

I_T = 4,083 cm^4

r_x = 7.50 cm

r_y = 6.32 cm

Validation

$R_y = R_{yn}/\ \gamma_m$ = 561.9 MPa

$R_s = 0.58 \times R_y/\ \gamma_m$ = 325.9 MPa

Bending moment:

$M_x = q_x \times L^2 / 8 = 30\ (5)^2 / 8 = 93.75$ kN·m

Design for Strength (Cl. 9.1.1)

$$\sigma = \frac{N}{A_n} = \frac{80}{52.84(10)^{-1}} = 14.54 < 0.1R_y = 56.19$$

$R_{yn} \le 440$ N/mm^2

$\tau = 0$; i.e., $< 0.5 \times R_s$

So, as per Cl. 9.1.1, F.105 should not be checked. Rather F.106 needs to be checked.

$$\frac{\frac{N}{A_n} \pm \frac{M_x y}{I_{xn}} \pm \frac{M_y x}{I_{yn}} \pm \frac{B_\omega}{I_{\omega n}}}{R_y \gamma_c} \le 1 \qquad \text{(F.(106))}$$

where

y	=	D / 2 = 100 mm
B_ω	=	0

So, the ratio is $\dfrac{14.54 + \dfrac{93.75(100)}{2{,}975 \times 10^{-2}}}{561.9 \times 1} = 0.588 < 1$

Design for Stability (Cl. 9.2.2)

To satisfy F.109, $m_{ef} \le 20$, where:

$$m_{ef} = \eta \times m \qquad \text{(F.110)}$$

where

e	=	$M / N = 93.75 / 80 = 1.172$ m
m	=	$e \times {}^{A}\!/_{W_c} = 1.172 \times 0.00055 / 0.000319 = 20.20$

Thus, $m > 20$, so must review Section 8 for further checks.

Design for Stability for a Box Section (Cl. 9.2.10)

Check the stability of box bars with constant cross-section subject to compression on one or two main planes:

$$\frac{N}{\phi_{ey} \times A \times R_y \times \gamma_c} + \frac{M_x}{c_x \times \delta_x W_{x,\min} \times R_y \times \gamma_c} \qquad \text{(F.120)}$$

As per this clause, for uniaxial bending in the plane of maximum stiffness (i.e., $I_x > I_y$, $M_y = 0$), ϕ_{ey} should be replaced by ϕ_y.

$\lambda_x = K_x \times L / r_x = 1.0\ (500) / 7.50 = 66.34$ (Cl 10.4.1)

$\lambda_y = K_y \times L / r_y = 1.0\ (500) / 6.32 = 79.12$

$$\bar{\lambda}_x = \lambda_x \sqrt{\frac{R_y}{E}} = 66.64\sqrt{\frac{561.9}{206{,}000}} = 3.480$$

$$\bar{\lambda}_y = \lambda_y \sqrt{\frac{R_y}{E}} = 79.12\sqrt{\frac{561.9}{206{,}000}} = 4.132$$

The conditional slenderness, $\bar{\lambda}$, is the larger of $\bar{\lambda}_x$ and $\bar{\lambda}_y$. Thus, $\bar{\lambda} = 4.132$

From Table 7, $a = 0.03$ and $\beta = 0.06$ for a tube cross-section.

$$\delta = 9.87\left(1 - a + \beta \times \bar{\lambda}\right) + \bar{\lambda}^2 = 9.87\left(1 - 0.03 + 0.06 \times 4.132\right) + (4.132)^2 = 29.098 \qquad \text{(F.(9))}$$

$$\phi = 0.5\frac{\delta - \sqrt{\delta^2 - 39.48 \times \bar{\lambda}^2}}{\bar{\lambda}^2} = 0.476$$

Note that per Cl. 7.1.3, for section type *a*, the maximum value of ϕ is given as $7.6/\bar{\lambda}^2 = 7.6/(4.132)^2 = 0.445$ for conventional flexibility greater than 3.8. Thus, take $\phi = 0.445$.

$c_x = 1.14$

$$\delta_x = 1 + \frac{0.1N \times \bar{\lambda}x^2}{A \times R_y} = 1 + \frac{0.1 \times 80 \times (3.480)^2(10)}{52.84 \times 561.9} = 1.033 \qquad \text{(F.122)}$$

So the ratio for stability about x axis is:

$$\frac{80(10)^1}{0.445(52.84)(561.9)(1.0)} + \frac{93.75(10)^3}{1.14(1.03)(297.5)(561.9)(1.0)} = 0.061 + 0.478 = 0.537$$

<u>Check for Flexure</u>

$$\frac{M}{W_{n,min} R_y \gamma_c} \le 1 \qquad \text{[Eqn. 41 of SNiP SP16.13330.2011]}$$

where

$W_{n,min}$ = $W_x = 3{,}191.2\ cm^3 = 319.6(10)^{-6}\ m^3$

$$\frac{93.75}{297.5(10)^{-6} \times 561.9 \times 1.0} = 0.561 \le 1 \text{ (OK)}$$

<u>Check for Shear</u>

By inspection, the shear at the maximum moment location is zero under a uniformly distributed load.

$$\frac{QS}{It_w R_s \gamma_c} \le 1 \qquad \text{[Eqn. 42 of SNiP SP16.13330.2011]}$$

where

Q = $q.l/2 = 0\ kN$

$$\frac{QS}{It_w R_s \gamma_c} = 0 \le 1 \text{ (OK)}$$

<u>Check for Combined Shear & Flexure</u>

$$\frac{0.87}{R_y \gamma_c}\sqrt{\sigma_x^2 - \sigma_x \sigma_y + \sigma_y^2 + 3\tau_{xy}^2} \le 1$$

where

σ_x = $M / W_x = 93.75 \times 10^3 / 297.5 = 315.1\ MPa$

σ_y = 0 (No weak axis bending)

τ_{xy} = $QS / (I \times t_w) = 0\ MPa$

$$\frac{0.87}{561.9 \times 1.0}\sqrt{315.1^2} = 0.488 \le 1 \text{ (OK)}$$

V. SNiP SP16 2017 - Interaction check of a column

Design a column per the SP 16.13330.2017 code.

Details

A 6.78m tall, simply supported column has a European HE600B section. The column is subject to a 310 kN axial load along with a uniformly distributed load of 50 kN/m in the local Y axis. The steel used has a modulus of elasticity of 206,000 MPa and a $R_y = 239\ MPa$. $\gamma_c = 1$, $\gamma_m = 1.05$

Validation

$$R_y = R_{yn} / \gamma_m = 223.8 \text{ MPa}$$

$$R_s = 0.58 \times R_y / \gamma_m = 129.8 \text{ MPa}$$

Shear force at support:

$$Q = q_x \times L / 2 = 171.8 \text{ kN}$$

$$M_x = q_x \times L^2 / 8 = 295.0 \text{ kN} \cdot \text{m}$$

Bending moment:

$$M_x = q_x \times L^2 / 8 = 171.8\ (6.78)^2 / 8 = 295.0 \text{ kN} \cdot \text{m}$$

<u>Design for Strength (Cl. 9.1.1)</u>

$$\sigma = \frac{N}{A_n} = \frac{310}{270(10)^{-1}} = 11.48 < 0.1R_y = 22.38$$

$R_{yn} \leq 440$ N/mm^2

$\tau = 0$; i.e., $> 0.5 \times R_s$

So, as per Cl. 9.1.1, F.105 should not be checked. Rather F.106 needs to be checked.

$$m_{ef} = \eta \times m$$

where

m = $e \times A\ /\ W_c = 4.51$ ($e = M/N = 0.9516$)

$$\lambda_x = \frac{k_x l}{r_x} = \frac{1.0 \times 6.87}{0.2517} = 27.3$$

$$\lambda_y = \frac{k_y l}{r_y} = \frac{1.0 \times 6.87}{0.0708} = 97.0$$

$$\bar{\lambda}_x = \lambda_x \sqrt{\frac{R_y}{E}} = 27.3\sqrt{\frac{223.8}{206,\ 000}} = 0.900$$

$$\bar{\lambda}_y = \lambda_y \sqrt{\frac{R_y}{E}} = 97.0\sqrt{\frac{223.8}{206,\ 000}} = 3.198$$

Therefore, $\bar{\lambda} = min\ (\bar{\lambda}_x,\ \bar{\lambda}_y) = 0.900$

$$\eta = (1.90 - 0.1m) - 0.02(6 - m)\bar{\lambda} = (1.90 - 0.1 \times 4.51) - 0.02(6 - 4.51)0.900 = 1.422$$

So, $m_{ef} = 1.422 \times 4.51 = 6.41 < 20$ [As per F.(110)]

$$A_f / A_w = 90 / 90 = 1$$

$$\frac{\frac{N}{A_n} \pm \frac{M_x y}{I_{xn}} \pm \frac{M_y x}{I_{yn}} \pm \frac{B_\omega}{I_{\omega n}}}{R_y \gamma_c} \leq 1 \qquad \text{(F.(106))}$$

where

x = 150 mm
y = 300 mm
B_ω = 0

So, the ratio is $\dfrac{11.48 + \dfrac{295.0(300)}{171,\ 000 \times 10^{-2}}}{223.8 \times 1} = 0.28 < 1$

<u>Design for Stability (Cl. 9.2.2)</u>

From Table E.3, depending on conditional slenderness and reduced relative eccentricity:

$\phi_e = 0.2144$

$$\frac{N}{\phi_e \times A \times R_y \times \gamma_c} = \frac{310}{0.2144 \times 270(10)^{-1} \times 223.8 \times 1} = 0.24 < 1 \qquad \text{(F.(109))}$$

<u>Design for Stability (Cl. 9.2.4)</u>

Calculate the stability of eccentrically compressed elements of constant cross-section, out-of-plane bending moment in the plan of maximum stiffness ($I_x > I_y$), coinciding with the plane of symmetry:

$$\frac{N}{c \times \phi_y \times A \times R_y \times \gamma_c} \leq 1 \qquad \text{(F.(111))}$$

where

ϕ_y	=	$\frac{0.5(\delta - \sqrt{\delta^2 - 39.48\bar{\lambda}^2}}{\bar{\lambda}^2}$
$\bar{\lambda}$	=	conditional slenderness $= max(\bar{\lambda_x}, \bar{\lambda_y}) = 3.198$
δ	=	$9.87(1 - \alpha + \beta\bar{\lambda}) + \bar{\lambda}^2$, per Eq. 9

From Table 7, $\alpha = 0.03$ and $\beta = 0.06$.

$$\delta = 9.87[1 - 0.03 + 0.06(3.198)] + (3.198)^2 = 21.70$$

$$\phi_y = 0.5\frac{21.70 - \sqrt{(21.70)^2 - 39.48 \times (3.198)^2}}{(3.198)^2} = 0.660$$

$$c = \frac{\beta}{1 + \alpha \times m_x} \qquad \text{(Cl. 9.2.5)}$$

where

α	=	$0.65 + 0.05 \times m_x = 0.875$
$\bar{\lambda_y}$	=	3.14
δ_c	=	$9.87[1 - 0.03 + 0.06(3.14)] + (3.14)^2 = 21.29$
ϕ_c	=	$0.5\frac{21.29 - \sqrt{(21.29)^2 - 39.48 \times (3.14)^2}}{(3.14)^2} = 0.674$
β	=	$\sqrt{\frac{\phi_c}{\phi_y}} = \sqrt{\frac{0.674}{0.661}} = 1.009$

Therefore, $c = \frac{1.009}{1 + 0.875 \times 4.51} = 0.204 < 1$

So, the ratio is $\frac{310}{0.204 \times 0.66 \times 270(10)^{-1} \times 223.9 \times 1} = 0.38 < 1$

Calculate C_{max} Per Annex E.1

$$c_{max} = \frac{2}{1 + \delta\beta + \sqrt{(1 + \delta\beta)^2 + \frac{16}{\mu}\left(\alpha - \frac{e_x}{h}\right)^2}} \qquad \text{(F.(E.1))}$$

where

δ	=	$4 \times \rho / \mu$
ρ	=	$\frac{I_x + I_y}{Ah^2} + \alpha^2$
μ	=	$8\omega + \frac{0.156 \times I_t \lambda_y^2}{Ah^2}$
ω	=	$\frac{I_\omega}{I_y h_c^2} = \frac{h_c^2 \times b^3 \times t_f / 24}{I_y h_c^2} = \frac{b^3 \times t_f}{24 I_y} = \frac{(30\ cm)^3 \times 3\ cm}{24 \times 13,\ 530\ cm^4} = 0.249$
I_t	=	$\frac{k}{3}\Sigma b_i t_i^3 = \frac{1.29}{3}\left[2(30cm)(3cm)^3 + (60cm - 2 \times 3cm)(1.55cm)^3\right] = 783.1cm^4$ ($k = 1.29$)
e_x	=	$M / N = 295 / 310 = 0.952$
B	=	$1 + 2(\beta / \rho)(e_x / h_c) = 1$

As per Table E.6, $\alpha = 0, \beta = 0$

$$\mu = 8(0.249) + \frac{0.156 \times (783.1)(97.0)^2}{270 \times (60)^2} = 3.17$$

$$\rho = \frac{171,\ 000 + 13,\ 530}{270 \times 60^2} + 0 = 0.190$$

$$\delta = \frac{4 \times 0.19}{3.17} = 0.24$$

$$c_{\text{max}} = \frac{2}{1 + 0.24(0) + \sqrt{(1 + 0.24 \times 0)^2 + \frac{16}{3.17}\left(0 - \frac{0.952}{0.6}\right)^2}} = 0.43$$

V. SNiP SP16 2017 - I section with biaxial moment

Design an I section subjected to uniform distributed loads in both major in minor axes per the SP 16.13330.2017 code.

Details

A 6m long, simply supported beam has a European HE500A section. The beam is subjected to a uniform distributed load of 132.2 kN/m in the Y direction and 30 kN/m in the Z direction. The steel used has a modulus of elasticity of 206,000 MPa and a $R_{yn} = 235\ MPa.\ \gamma_m = 1.05, \gamma_c = 1$

Validation

$$R_y = R_{yn}/\ \gamma_m = 223.8\ \text{MPa}$$

$$R_s = 0.58 \times R_y/\ \gamma_m = 129.8\ \text{MPa}$$

<u>Check for Flexure</u>

Need to satisfy the following equation from Cl. 8.2.1:

$$\frac{M_x}{I_{xn} R_y \gamma_c} y \pm \frac{M_y}{I_{yn} R_y \gamma_c} s \pm \frac{B\omega}{I_{\omega n} R_y \gamma_c} \leq 1 \qquad \text{(Eq. 43)}$$

where

M_x = $132.2\ (6)^2\ /\ 8 = 594.9\ kN{\cdot}m$
M_y = $30\ (6)^2\ /\ 8 = 135\ kN{\cdot}m$
B_x = 0

Thus, the ratio is $\frac{M_x}{I_{xn}R_y\gamma_c}y \pm \frac{M_y}{I_{yn}R_y\gamma_c}s \pm \frac{B\omega}{I_{\omega n}R_y\gamma_c} = 1.62 > 1$

Check for Shear

Need to satisfy the following equation:

$$\frac{QS}{It_w R_s \gamma_c} \le 1 \qquad \text{(Eq. 42)}$$

where

Q = $0\ kN$

Thus, the ratio is $0.0 < 1$

Check for Combined Flexure & Shear

Need to satisfy the following equation:

$$\frac{0.87}{R_y\gamma_c}\sqrt{{\sigma_x}^2 - \sigma_x\sigma_y + {\sigma_y}^2 + 3{\tau_{xy}}^2} \le 1 \qquad \text{(Eq. 44)}$$

where

σ_x = $M_x\ /\ W_x = 594.9\ (10)^3\ /\ 3{,}550 = 167.6\ MPa$
σ_y = $M_y\ /\ W_y = 135\ (10)^3\ /\ 691.1 = 195.3\ MPa$
τ_{xy} = $0\ MPa$

Thus, the ratio is $\frac{0.87}{223.8 \times 1.}\sqrt{(167.6)^2 -\ 167.6\ \times\ 195.3\ + (195.3)^2} = 0.71 < 1$

Check for Stability

Check per Cl. 8.4.4. From Table 11 of SP 16.13330-2017:

$$\phi_x = \frac{M_x}{W_c \times \gamma_c} = \frac{594.9}{3{,}550 \times (10)^{-3} \times 1} = 167.6 \text{ MPa}$$

$$\bar{\lambda}_{ub} = \left[0.35 + 0.0032\frac{b}{t} + \left(0.76 - 0.02\frac{b}{t}\right)\frac{b}{h}\right]\sqrt{\frac{R_y}{\phi_x}}$$

$$\bar{\lambda}_{ub} = \left[0.35 + 0.0032\frac{300}{23} + \left(0.76 - 0.02\frac{300}{23}\right)\frac{300}{490}\right]\sqrt{\frac{235}{167.6}} = 0.823$$

$$\bar{\lambda}_b = \frac{l_{ef}}{b}\sqrt{\frac{R_y}{E}}\frac{6}{0.3}\sqrt{\frac{235}{206{,}000}} = 0.659 < \bar{\lambda}_{ub}$$

So, the stability of the beam is ensured per Cl. 8.4.4.b. Check per Cl 8.4.1 is not required.

Check for Deflection

$$f_y = \frac{5}{384}\frac{ql^4}{EI_x} = \frac{5}{384}\frac{132 \times 6^4}{206(10)^6 86{,}970(10)^{-8}} = 0.0124 \text{ m}$$

$$f_z = \frac{5}{384}\frac{ql^4}{EI_x} = \frac{5}{384}\frac{30 \times 6^4}{206(10)^6 10,\ 356(10)^{-8}} = 0.0237 \text{ m}$$

$$f_{\max} = \sqrt{(0.0124)^2 + (0.0237)^2} = 0.0267 \text{ m}$$

The maximum member deflection is limited to $l / 200 = 0.03\ m$

Thus, the ratio is $0.0267 / 0.03 = 0.89$

Results

V. SNiP SP16 2017 - I section with UDL

Design an I section subjected to a uniform distributed load per the SP 16.13330.2017 code.

Details

A 5m long, simply supported beam has a European HD320X127 section. The beam is subjected to a uniform distributed load of 100 kN/m in the Y direction. The steel used has a modulus of elasticity of 206,000 MPa and a $R_{yn} = 235$ *MPa*. $\gamma_{c1} = 1.1$, $\gamma_{c2} = 1.1$

Validation

$$R_y = R_{yn} / \gamma_m = 223.8 \text{ MPa}$$

$$R_s = 0.58 \times R_y / \gamma_m = 129.8 \text{ MPa}$$

<u>Check for Flexure</u>

Need to satisfy the following equation:

$$\frac{M}{W_{n,\min} R_y \gamma_c} \leq 1 \qquad \text{(Eq. 41)}$$

where

$$M = 100\,(5)^2 \,/\, 8 = 312.5 \text{ kN·m}$$

Thus, the ratio is $\frac{312.5}{1{,}926.5 \times 235(10)^{-3} \times 1.1} = 0.63 < 1$

<u>Check for Shear</u>

Need to satisfy the following equation:

$$\frac{QS}{I t_w R_s \gamma_c} \le 1 \qquad \text{(Eq. 42)}$$

where

Q = $0\ kN$

Thus, the ratio is $0.0 < 1$

Check for Stability

$$\phi_x = \frac{M_x}{W_c \times \gamma_c} = \frac{312.5}{1{,}926.5 \times (10)^{-3} \times 1.1} = 147.5 \text{ MPa}$$

$$\bar{\lambda}_{ub} = \left[0.35 + 0.0032\frac{b}{t} + \left(0.76 - 0.02\frac{b}{t}\right)\frac{b}{h}\right]\sqrt{\frac{R_y}{\phi_x}}$$

$$\bar{\lambda}_{ub} = \left[0.35 + 0.0032\frac{300}{20.5} + \left(0.76 - 0.02\frac{300}{20.5}\right)\frac{300}{320}\right]\sqrt{\frac{235}{147.5}} = 1.054$$

$$\bar{\lambda}_b = \frac{l_{ef}}{b}\sqrt{\frac{R_y}{E}}\frac{10}{0.3}\sqrt{\frac{235}{206{,}000}} = 1.126 > \bar{\lambda}_{ub}$$

So, the stability of the beam is *not* ensured per Cl. 8.4.4.b. Check per Cl 8.4.1 needs to be performed.

Check for Lateral-Torsional Buckling

Use an effective length of 10 m.

Need to satisfy the following equation:

$$\frac{M_x}{\phi_b W_{cx} R_y \gamma_c} \le 1 \qquad \text{(Eq. 69)}$$

$$\alpha = 1.54\frac{I_t}{I_y}\left(\frac{l_{ef}}{h}\right)^2 = 1.54\frac{225.1}{9{,}239}\left(\frac{10}{0.32}\right)^2 = 36.64 \qquad \text{(Eq. G.4)}$$

Since $0.1 < \alpha < 40$, from Table G.1:

$$\psi = 1.6 + 0.08\alpha = 4.531$$

$$\phi_1 = \psi\frac{I_y}{I_x}\left(\frac{h}{l_{ef}}\right)^2\frac{E}{R_y} = 1.219$$

$$\phi_b = 0.68 + 0.21\phi_1 = 0.68 + 0.21(1.219) = 0.936$$

Thus, the ratio is $\frac{312.5}{0.936 \times 1{,}926.5(10)^{-3} \times 235 \times 1.1} = 0.67 < 1$

Check for Combined Flexure & Shear

Need to satisfy the following equation:

$$\frac{0.87}{R_y \gamma_c}\sqrt{{\sigma_x}^2 - \sigma_x\sigma_y + {\sigma_y}^2 + 3{\tau_{xy}}^2} \le 1 \qquad \text{(Eq. 44)}$$

where

σ_x = $M_x / W_x = 312.5\ (10)^3 / 1{,}926.5 = 162.2\ MPa$
σ_y = $M_y / W_y = 0\ MPa$
τ_{xy} = $0\ MPa$

Thus, the ratio is $\frac{0.87}{235 \times 1.1}\sqrt{(162.2)^2} = 0.55 < 1$

Check for Deflection

$$f_{max} = \frac{5}{384}\frac{ql^4}{EI_x} = \frac{5}{384}\frac{100 \times 5^4}{206(10)^6 30{,}820(10)^{-8}} = 0.0128 \text{ m}$$

The maximum member deflection is limited to $l\ /\ 200 = 0.025\ m$

Thus, the ratio is $0.0128\ /\ 0.025 = 0.51$

Results

V. SNiP SP16 2017 - I section with axial force and Bi-moment

Design a column subject to axial compressive force and biaxial moment per the SP 16.13330.2017 code.

Details

A 5 m tall, simply supported column has an HE650A section. The column is subject to a 80 kN axial load along with a uniformly distributed load of 30 kN/m in the local X axis and a uniformly distributed load of 2 kN/m in the local Y axis. The steel used has a modulus of elasticity of 206,000 MPa and a $R_y = 235\ MPa$. $\gamma_c = 1$, $\gamma_m = 1.05$

Section Properties

D = 640 mm

B = 300 mm

t_f = 26 mm

t_w = 13.5 mm

A = 241.6 cm^2

I_x = 175,200 cm^4

I_y = 11,720 cm^4

I_T = 458 cm^4

r_x = 26.93 cm

r_y = 6.97 cm

Validation

$R_y = R_{yn}/\ \gamma_m = 223.8$ MPa

$R_s = 0.58 \times R_y/\ \gamma_m = 129.8$ MPa

Shear force at support:

$Q_x = q_x \times L / 2 = 75$ kN

Bending moment:

$M_x = q_x \times L^2 / 8 = 30\ (5)^2 / 8 = 93.75$ kN·m

$M_y = q_y \times L^2 / 8 = 2\ (5)^2 / 8 = 6.25$ kN·m

Design for Strength (Cl. 9.1.1)

$$\sigma = \frac{N}{A_n} = \frac{80}{241.6(10)^{-1}} = 3.311 < 0.1R_y = 22.38$$

$R_{yn} \leq 440$ N/mm^2

$\tau = 0$; i.e., $< 0.5 \times R_s$

So, as per Cl. 9.1.1, F.105 should not be checked. Rather F.106 needs to be checked.

$$m_{ef} = \eta \times m$$

where

$m = e \times A\ /\ W_c = 5.172$ ($e = M/N = 93.75\ /\ 80 = 1.172$)

$$\lambda_x = \frac{k_x l}{r_x} = \frac{1.0 \times 500}{26.93} = 18.57$$

$$\lambda_y = \frac{k_y l}{r_y} = \frac{1.0 \times 500}{6.97} = 71.74$$

$$\bar{\lambda}_x = \lambda_x \sqrt{\frac{R_y}{E}} = 18.58\sqrt{\frac{223.8}{206{,}000}} = 0.612$$

$$\bar{\lambda}_y = \lambda_y \sqrt{\frac{R_y}{E}} = 71.74\sqrt{\frac{223.8}{206{,}000}} = 2.364$$

Therefore, $\bar{\lambda} = min\ (\bar{\lambda}_x,\ \bar{\lambda}_y) = 0.612$

Evaluate η, the coefficient of the shape of cross section vertical element when $5 < m \leq 20, A_f / A_w \geq 1$, and $0 \leq \lambda \leq 5$:

$$\eta = 1.4 - 0.02\bar{\lambda} = (1.4 - 0.02 \times 0.612) = 1.388$$ (Table Д.2, Note 1)

So, $m_{ef} = 1.388 \times 5.172 = 7.18 < 20$ [As per F.(110)]

$$\frac{\frac{N}{A_n} \pm \frac{M_x y}{I_{xn}} \pm \frac{M_y x}{I_{yn}} \pm \frac{B_\omega}{I_{\omega n}}}{R_y \gamma_c} \leq 1$$ (F.(106))

where

x	=	150 mm
y	=	320 mm
B_ω	=	0

So, the ratio is $\frac{3.311 + \frac{93.75(320)}{175{,}200 \times 10^{-2}} + \frac{6.25(150)}{11{,}720 \times 10^{-2}}}{223.8 \times 1} = 0.127 < 1$

Design for Stability (Cl. 9.2.2)

From Table E.3, depending on conditional slenderness and reduced relative eccentricity:

$\phi_e = 0.203$

$$\frac{N}{\phi_e \times A \times R_y \times \gamma_c} = \frac{80}{0.203 \times 241.6(10)^{-1} \times 223.8 \times 1} = 0.073 < 1$$ (F.(109))

Design for Stability (Cl. 9.2.4)

Calculate the stability of eccentrically compressed elements of constant cross-section, out-of-plane bending moment in the plan of maximum stiffness ($I_x > I_y$), coinciding with the plane of symmetry:

$$\frac{N}{c \times \phi_y \times A \times R_y \times \gamma_c} \leq 1$$ (F.111)

where

ϕ_y	=	$\frac{0.5(\delta - \sqrt{\delta^2 - 39.48\bar{\lambda}^2}}{\bar{\lambda}^2}$
$\bar{\lambda}$	=	conditional slenderness $= max\,(\bar{\lambda}_x, \bar{\lambda}_y) = 2.365$
δ	=	$9.87\left(1 - \alpha + \beta\bar{\lambda}\right) + \bar{\lambda}^2$, per Eq. 9 where $\alpha = 0.03$ and $\beta = 0.06$ from Table 7.

$= 9.87[1 - 0.03 + 0.06(2.365)] + (2.365)^2 = 16.57$

$$\phi_y = 0.5\frac{16.57 - \sqrt{(16.57)^2 - 39.48 \times (2.365)^2}}{(2.365)^2} = 0.826$$

$$c_{max} = c_5(2 - 0.2m_x) + c_{10}(0.2m_x - 1)$$ (F.114)

where

α	=	$0.65 + 0.05 \times m_x = 0.909$
β	=	1.0 for $\lambda_y < 3.14$ per Table 21
m_x	=	relative eccentricity = $m = 5.172$
c_5	=	$\frac{\beta}{1 + \alpha \times m_x} = \frac{1}{1 + 0.909 \times 5.172} = 0.175 < 1.0$ per F.112

ψ = $2.25 + 0.07a = 2.507$ where:

$$a = 1.54\frac{I_t}{I_y}\left(\frac{l_{ef}}{h}\right)^2 = 1.54\frac{458}{11{,}720}\left(\frac{5{,}000}{640}\right)^2 = 3.673 \quad \text{(Eq. G. 4)}$$

ϕ_1 = $\psi\frac{I_y}{I_x}\left(\frac{h}{l_{ef}}\right)^2\frac{E}{R_y} = 2.507\frac{11{,}720}{175{,}200}\left(\frac{640}{5{,}000}\right)^2\frac{206{,}000}{223.8} = 2.529$

ϕ_b = $0.68 + 0.21 \times \phi_1 = 1.211 > 1.0$, take $\phi_b = 1.0$

c_{10} = $\frac{1}{1 + m_x(\phi_1 / \phi_b)} = \frac{1}{1 + 5.172 \times (0.826 / 1)} = 0.190$ per F.113

Therefore, $c_{max} = 0.175(2 - 0.2 \times 5.172) + 0.190(0.2 \times 5.172 - 1) = 0.176$

So, the ratio is $\frac{80}{0.176 \times 0.826 \times 242(10)^{-1} \times 223.9 \times 1} = 0.102 < 1$

<u>Design for Stability (Cl. 9.2.9)</u>

$$\frac{N}{\phi_{exy} \times A \times R_y \times \gamma_c} \le 1 \quad \text{(F.111)}$$

where

ϕ_{ey} = 0.333 (per Table Д.3)

ϕ_{exy} = $\phi_{ey}\left(0.6\sqrt[3]{c} + 0.4\sqrt[4]{c}\right) = 0.333\left(0.6\sqrt[3]{0.176} + 0.4\sqrt[4]{0.176}\right) = 0.198$

So, the ratio is $\frac{80}{0.198 \times 242(10)^{-1} \times 223.9 \times 1} = 0.075 < 1$

V. South Africa

V.I Section in Bending

Determine the capacity of a South African I-section beam in bending per South African steel design code (SANS10162-1:1993). The beam has torsional and simple lateral rotational restraint at the supports, and the applied point load provides effective lateral restraint at the point of application is braced at its ends for both axes.

```

V. I Section in Compression

Determine the capacity of a South African I-section column in axial compression per South African steel design code (SANS10162-1:1993). Column is braced at its ends for both axes.

Reference

Example 4.3.4.1, page 4.18, *Structural Steel Design to SABS 0162-1 1993 (Limit States Design)*. Greg Parrott, 1st edition, Shades Technical Publications. 1993

V. United Kingdom

V. BS5950 2000 - Fully Restrained Simply Supported Beam

A 6.5 m, simply-supported beam is fully restrained along its length. The beam is designed in S275 steel for the loading described.

Reference

Steelwork Design Guide to BS 5950-1:2000, Volume 2, Worked Examples, SCI publication P326, Example 2, The Steel Construction Institute.

Related Links

- *D3.B.5 Member Capacities* (on page 1382)

Problem

The beam is designed in S275 steel for the loading described.

Dead Loads, $\gamma_{fd} = 1.4$:

- Distributed load (including s/w) $w_d = 15\ kN/m$
- Point Load $W_d = 40\ kN$

Imposed Loads, $\gamma_{fi} = 1.6$:

- Distributed load $W_i = 30\ kN/m$
- Point Load $W_i = 50\ kN$

Comparison

Table 705: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Shear capacity, P_v(kN)	888	888.4	none

Result Type	Theory	STAAD.Pro	Difference
Moment capacity, M_{cx} (kN-m)	649	649	none
Total deflection, δ (mm)	8.69	9.25[a]	6.4%
Deflection limit (mm)	18.1	18.056	none

a. STAAD.Pro includes effects of shear deformation, resulting in a higher calculated maximum deflection.

STAAD Input

`TRACK 2 ALL`	Maximum detail output
`UNI 0 ALL`	Identifies the beam as fully restrained
`DEF 360 ALL`	Limiting ratio of beam length to maximum deflection
`DJ1 1 ALL`	Identifies starting joint of "physical member" for deflection check
`DJ2 3 ALL`	Identifies ending joint of "physical member" for deflection check

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\UK\BS5950 2000 - Fully Restrained Simply Supported Beam.STD` is typically installed with the program.

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

V. BS5950 2000 - Unrestrained Simply Supported Beam

Design of a 9 m, unrestrained beam with end moments.

Reference

Steelwork Design Guide to BS 5950-1:2000, Volume 2, Worked Examples, SCI publication P326, Example 3, The Steel Construction Institute.

Related Links

- *D3.B.5 Member Capacities* (on page 1382)

Problem

Intermediate point loads are applied to the bottom flange. These do not provide restraint against lateral-torsional buckling. The beam is designed in S275 steel.

Dead Loads, $\gamma_{fd} = 1.4$:

- Selfweight $w_s = 3\ kN/m$
- Point Load $W_{1d} = 40\ kN$
- Point Load $W_{2d} = 20\ kN$

Imposed Loads, $\gamma_{fi} = 1.6$:

- Point Load $W_{1i} = 60\ kN$
- Point Load $W_{2i} = 30\ kN$

Comparison

Table 706: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Shear capacity, P_v (kN)	636	635.9	none
Moment capacity, M_{cx} (kN-m)	404	404.5	none
Lateral-torsional buckling capacity, M_b (kN-m)	150	150.26	none

STAAD Input

TRACK 2 ALL	Maximum detail output
MLT 0.46ALL	Specifies the m_{LT} value to use in the lateral-torsional buckling calculations
UNI 6.3 ALL	Specifies the lateral-torsional buckling length to be used

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\UK\BS5950 2000 - Unrestrained Simply Supported Beam.STD` is typically installed with the program.

V. BS5950 2000 - Beam from UC Restrained at Loading

Design of a simply-supported, 9m beam, which is laterally restrained at the ends and at the points of load application only.

Reference

Steelwork Design Guide to BS 5950-1:2000, Volume 2, Worked Examples, SCI publication P326, Example 5, The Steel Construction Institute.

Related Links

- *D3.B.5 Member Capacities* (on page 1382)

Problem

The beam is a universal column from S355 steel.

Loads:

- Selfweight $w_s' = 3.4\ kN/m$
- Point Load $W_1' = 122\ kN$
- Point Load $W_2' = 61\ kN$

Comparison

Table 708: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Shear capacity, P_v (kN)	465	465.5	none
Moment capacity, M_{cx} (kN-m)	350	350.5	none
Lateral-torsional buckling moment, M_b (kN-m)	333	332.17	none

STAAD Input

SGR 1 ALL	Specifies the use of Grade S355 steel
TRACK 2 ALL	Maximum detail output
MLT _MAIN J1 U2 U3 J4	Specifies that m_{LT} is to be calculated with the end joints fully restrained and the intermediate joints restraining the upper flange

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\UK\BS5950 2000 - Beam from UC Restrained at Loading.STD` is typically installed with the program.

V. BS5950 2000 - Pinned Column Using Non-Slender UC

A 6.0 m column is pin ended about both axes and has no intermediate restraints.

Reference

Steelwork Design Guide to BS 5950-1:2000, Volume 2, Worked Examples, SCI publication P326, Example 6, The Steel Construction Institute.

Related Links

- *D3.B.5 Member Capacities* (on page 1382)

Problem

The column is designed in S275 steel for the factored loading.

Point load, $F_c = 2{,}500\ kN$

Comparison

Table 709: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Slenderness about strong axis, λ_x	38.5	38.299	none
Slenderness about weak axis, λ_y	63.6	63.569	none
Compression capacity, P_c (kN)	3,100	3,090	none

STAAD Input

`TRACK 2 ALL`	Maximum detail output
`SGR 0 ALL`	Identifies steel grade as S275

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\UK\BS5950 2000 - Pinned Column Using Non-Slender UC.STD` is typically installed with the program.

V. United States

V. AASHTO

V. AASHTO 17th Ed ASD - Design Frame

The following compares the solution of a design performed using STAAD.Pro against a hand calculation.

Reference

Following step by step hand calculation of Allowable Stress Steel Design per the AASHTO *Standard Specifications for Highway Bridges*, 17th Edition (2002).

Related Links

- *D1.D.1 AASHTO (ASD)* (on page 1176)

Problem

Determine the allowable stresses (AASHTO code) for the members of the structure as shown in figure. Also, perform a code check for these members based on the results of the analysis.

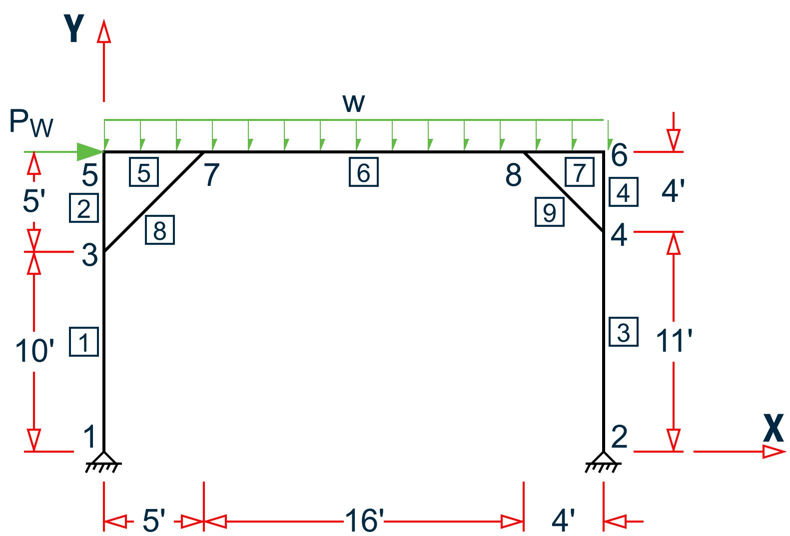

Figure 500: AASHTO ASD verification problem

Members 1, 2 = W12X26, Members 3, 4 = W14X43

Members 5, 6, 7 = W16X36, Memb8= L40404,

Member 9 = L50506

The frame is subject to the following load cases:

1. a uniform gravity load along the beam, $w = 2\ kips/ft$ (dead + live)
2. a lateral wind load, $F = 15\ kips$
3. a combination of 75% of load 1 and 75% of load 2

Solution

Only the AASHTO steel design elements are check here. No structural analysis calculations are included in these hand verifications.

Though the program does check shear per the AASHTO specifications, those calculations are not reflected here. Only the controlling stress ratios are presented.

As all members are grade 36 steel, the following critical slenderness parameter applies to each:

$$C_c = \sqrt{\frac{2\pi^2 E}{F_y}} = \sqrt{\frac{2\pi^2 29,\ 000}{36}} = 126.1$$

Member 1

Size W 12X26, L = 10 ft., a = 7.65 in^2, S_z = 33.39 in^3

From observation, Load case 1 will govern

- Fx = 25.0 kip (compression)
- Mz= 56.5 k-ft

Calculate the allowable stress as per Table 10.32.1A.

Bending Minor Axis

Allowable minor axis bending stress:

$$\text{FTY} = \text{FTZ} = 0.55 \cdot F_Y = 19.8 \text{ ksi}$$

Bending Major Axis

$$F_{cz} = \frac{50(10)^6 C_b}{S_{xc}}\left(\frac{I_{yc}}{l}\right)\sqrt{0.772\frac{J}{I_{yc}} + 9.87\left(\frac{d}{l}\right)^2} \le 0.55F_y$$

Where:

$$C_b = 1.75 + 1.05(M1/M2)+0.3x(M1/M2)^2$$

M1 = 0, so $C_b = 1.75$

S_{zc} = Section modulus with respect to the compression flange =$204/(0.5 \cdot 12.22) = 33.38789\ in^3$

$$I_{YC} = t_b{}^3/12 = 0.38 \cdot 6.49^3/12 = 8.6564 \text{ in}^4$$

$$J = (2 \text{ x } 6.49 \cdot 0.38^3 + (12.22 - 2 \cdot 0.38) \cdot 0.23^3)/3 = 0.28389 \text{ in}^4$$

$$F_{cz} = \frac{50(10)^6 1.75}{33.38789}\left(\frac{8.6564}{120}\right)\sqrt{0.772\frac{0.28389}{8.6564} + 9.87\left(\frac{11.46}{120}\right)^2}10^{-3} = 64.375ksi$$

which is larger than $0.55 \cdot F_Y = 19.8\ ksi$, so $F_{CZ} = 19.8\ ksi$

Axial Compression

Critical $(kL/r) = 1.0 \cdot 120/1.5038 = 79.7978$

As $(kL/r) < C_c$, the allow axial stress in compression is given by:

$$F_a = \frac{F_y}{F.S.}\left[1 - \frac{(kL\ /r)^2 F_y}{4\pi^2 E}\right] = \frac{36}{2.12}\left[1 - \frac{(79.79)^2 36}{4\pi^2 29,\ 000}\right] = 13.58ksi$$

Actual Stress

Actual axial stress, $f_a = 25 / 7.65 = 3.26\ ksi$

The critical moment occurs at the end node of the beam. So we use the AASHTO equation 10.42 in section 10-36 to calculate the design ratio.

Actual bending stress = $f_{bz} = 56.5 \cdot 12 / 33.4 = 1.692 \cdot 12 = 20.3\ ksi$

$$F_{ez} = \frac{\pi^2 E}{F.S.(kL / r)^2} = \frac{\pi^2 29,000}{2.12(120 / 5.17)^2} = 250.6 ksi$$

From Table 10-36A, $C_{mz} = 0.85$

Equation 10-42

$$\frac{f_a}{F_a} + \frac{C_{mz} f_{bz}}{\left(1 - \frac{f_a}{F'_{ez}}\right) F_{bz}} + \frac{C_{my} f_{by}}{\left(1 - \frac{f_a}{F'_{ey}}\right) F_{by}} = \frac{3.26}{13.58} + \frac{0.58 \cdot 20.3}{\left(1 - \frac{3.26}{250.6}\right) 19.8} + 0 = 1.122$$

For the end section, use Equation 10.43:

$$\frac{f_a}{0.472 F_y} + \frac{f_{bz}}{F_{bz}} + \frac{f_{by}}{F_{by}} = \frac{3.26}{0.472(36)} + \frac{20.3}{19.8} + 0 = 1.217$$

The critical stress ratio is thus 1.217. The value calculated by STAAD is 1.218

Member 2

Size W 12X26, L = 5 ft., a = 7.65 in^2, Sz = 33.4 in^3

From observation Load case 1 will govern, Forces at the midspan are

- Fx = 8.71 kip (compression)
- Mz= 56.5 k-ft

Calculate the allowable stress as per Table 10.32.1A.

<u>Bending Minor Axis</u>

Allowable minor axis bending stress:

$$FTY = FTZ = 0.55 \cdot F_Y = 19.8 \text{ ksi}$$

<u>Bending Major Axis</u>

$$F_{cz} = \frac{50(10)^6 C_b}{S_{xc}} \left(\frac{I_{yc}}{l}\right) \sqrt{0.772 \frac{J}{I_{yc}} + 9.87 \left(\frac{d}{l}\right)^2} \leq 0.55 F_y$$

Where:

$$C_b = 1.75 + 1.05(M1/M2) + 0.3x(M1/M2)^2$$

M1 = 39.44 and M2 = 677.96, so $C_b = 1.69$

S_{zc} = Section modulus with respect to the compression flange =$204 / (0.5 \cdot 12.22) = 33.38789\ in^3$

$$I_{YC} = t_b{}^3/12 = 0.38 \cdot 6.49^3/12 = 8.6564 \text{ in}^4$$

$$J = (2 \text{ x } 6.49 \cdot 0.38^3 + (12.22 - 2 \cdot 0.38) \cdot 0.23^3)/3 = 0.28389 \text{ in}^4$$

$$F_{cz} = \frac{50(10)^6 1.69}{33.38789} \left(\frac{8.6564}{60}\right) \sqrt{0.772 \frac{0.28389}{8.6564} + 9.87 \left(\frac{11.46}{60}\right)^2} 10^{-3} = 227.34 ksi$$

which is larger than $0.55 \cdot F_Y = 19.8\ ksi$, so $F_{CZ} = 19.8\ ksi$

Axial Compression

Critical $(kL/r) = 1.0 \cdot 60/1.504 = 39.92$

As $(kL/r) < C_c$, the allow axial stress in compression is given by:

$$F_a = \frac{F_y}{F.S.}\left[1 - \frac{(kL\ /r)^2 F_y}{4\pi^2 E}\right] = \frac{36}{2.12}\left[1 - \frac{(39.92)^2 36}{4\pi^2 29,\ 000}\right] = 16.13 ksi$$

Actual Stress

Actual axial stress, $f_a = 8.71\ /\ 7.65 = 1.138\ ksi$

The critical moment occurs at the end node of the beam. So we use the AASHTO equation 10.42 in section 10-36 to calculate the design ratio.

Actual bending stress = $f_{bz} = 56.5 \cdot 12/33.4 = 1.691 \cdot 12 = 20.3\ ksi$

$$(KL/r)_z = 1 \cdot 60/5.16 = 11.618$$

$$F_{ez} = \frac{\pi^2 E}{F.S.(kL\ /r)^2} = \frac{\pi^2 29,\ 000}{2.12(11.618)^2} = 998.5 ksi$$

From Table 10-36A, $C_{mz} = 0.85$

Equation 10-42

$$\frac{f_a}{F_a} + \frac{C_{mz} f_{bz}}{\left(1 - \frac{f_a}{F'_{ez}}\right) F_{bz}} + \frac{C_{my} f_{by}}{\left(1 - \frac{f_a}{F'_{ey}}\right) F_{by}} = \frac{1.138}{16.13} + \frac{0.58 \cdot 20.3}{\left(1 - \frac{1.138}{998.5}\right) 19.8} + 0 = 0.942$$

For the end section, use Equation 10.43:

$$\frac{f_a}{0.472 F_y} + \frac{f_{bz}}{F_{bz}} + \frac{f_{by}}{F_{by}} = \frac{1.138}{0.472(36)} + \frac{20.3}{19.8} + 0 = 1.092$$

The critical stress ratio is thus 1.092. The value calculated by STAAD is 1.093.

Member 3

Size W 14X43, L = 11 ft., a = 12.6 in^2, Sz = 62.7 in^3

From observation Load case 3 will govern, Forces at the end are

- F_x = 25.5 kip (compression)
- M_z = 112.17 k-ft

Calculate the allowable stress as per Table 10.32.1A.

Bending Minor Axis

Allowable minor axis bending stress:

$$FTY = FTZ = 0.55 \cdot F_Y = 19.8\ ksi$$

Bending Major Axis

$$F_{cz} = \frac{50(10)^6 C_b}{S_{xc}}\left(\frac{I_{yc}}{l}\right)\sqrt{0.772\frac{J}{I_{yc}} + 9.87\left(\frac{d}{l}\right)^2} \le 0.55 F_y$$

Where:

C_b = 1.75 + 1.05(M1/M2)+0.3x(M1/M2)^2

M1 = 0, so $C_b = 1.75$

S_{zc} = Section modulus with respect to the compression flange = $428/(0.5 \cdot 13.66) = 62.7\ in^3$

$I_{YC} = tb^3/12 = 0.53 \cdot 8.0^3/12 = 22.61\text{in in}^4$

$J = (2 \cdot 8.0 \cdot 0.53^3 + (13.66 - 2 \cdot 0.53) \cdot 0.305^3)/3 = 0.913\ \text{in}^4$

$$F_{cz} = \frac{50(10)^6 1.75}{62.7}\left(\frac{22.61}{132}\right)\sqrt{0.772\frac{0.917}{22.61} + 9.87\left(\frac{12.6}{132}\right)^2}10^{-3} = 83.19ksi$$

which is larger than $0.55 \cdot F_Y = 19.8\ ksi$, so $F_{CZ} = 19.8\ ksi$

Axial Compression

Critical $(kL/r) = 1.0 \cdot 132/1.894 = 69.69$

As $(kL/r) < C_c$, the allow axial stress in compression is given by:

$$F_a = \frac{F_y}{F.S.}\left[1 - \frac{(kL\ /r)^2 F_y}{4\pi^2 E}\right] = \frac{36}{2.12}\left[1 - \frac{(69.69)^2 36}{4\pi^2 29,\ 000}\right] = 14.39ksi$$

Actual Stress

Actual axial stress, $f_a = 25.5\ /\ 12.6 = 2.024\ ksi$

The critical moment occurs at the end node of the beam. So we use the AASHTO equation 10.42 in section 10-36 to calculate the design ratio.

Actual bending stress = $f_{bz} = 112.17 \cdot 12/62.7 = 1.789 \cdot 12 = 21.467\ ksi$

$(KL/r)_z = 1 \cdot 132/5.828 = 22.649$

$$F_{ez} = \frac{\pi^2 E}{F.S.(kL\ /r)^2} = \frac{\pi^2 29,\ 000}{2.12(22.648)^2} = 263.18ksi$$

From Table 10-36A, $C_{mz} = 0.85$

Equation 10-42

$$\frac{f_a}{F_a} + \frac{C_{mz} f_{bz}}{\left(1 - \frac{f_a}{F'_{ez}}\right)F_{bz}} + \frac{C_{my} f_{by}}{\left(1 - \frac{f_a}{F'_{ey}}\right)F_{by}} = \frac{2.024}{14.39} + \frac{0.58 \cdot 21.467}{\left(1 - \frac{2.024}{263.21}\right)19.8} + 0 = 1.069$$

For the end section, use Equation 10.43:

$$\frac{f_a}{0.472F_y} + \frac{f_{bz}}{F_{bz}} + \frac{f_{by}}{F_{by}} = \frac{2.024}{0.472(36)} + \frac{21.467}{19.8} + 0 = 1.203$$

The critical stress ratio is thus 1.203. The value calculated by STAAD is 1.204.

Member 4

Size W 14X43, L = 4 ft., a = 12.6 in^2, Sz = 62.6 in^3

From observation Load case 3 will govern, Forces at the end are

- F_x = 8.75 kip (tension)

- M_z = 112.17 k-ft

Calculate the allowable stress as per Table 10.32.1A.

Bending Minor Axis

Allowable minor axis bending stress:

$$FTY = FTZ = 0.55 \cdot F_Y = 19.8 \text{ ksi}$$

Bending Major Axis

$$F_{cz} = \frac{50(10)^6 C_b}{S_{xc}}\left(\frac{I_{yc}}{l}\right)\sqrt{0.772\frac{J}{I_{yc}} + 9.87\left(\frac{d}{l}\right)^2} \le 0.55F_y$$

Where:

$$C_b = 1.75 + 1.05(M1/M2)+0.3 \cdot (M1/M2)^2$$

$$M1 = -191.36 \text{ Kip-in , } M2 = -1346.08 \text{ Kip-in so } C_b = 1.606$$

$$I_{YC} = tb^3/12 = 0.53 \cdot 8.0^3/12 = 22.61 \text{ in}^4$$

$$J = (2 \cdot 8.0 \cdot 0.53^3 + (13.66 - 2 \cdot 0.53) \cdot 0.305^3)/3 = 0.913 \text{ in}^4$$

$$F_{cz} = \frac{50(10)^6 1.606}{62.6}\left(\frac{22.61}{48}\right)\sqrt{0.772\frac{0.911}{22.61} + 9.87\left(\frac{12.6}{48}\right)^2}10^{-3} = 508.8ksi$$

which is larger than $0.55 \cdot F_Y = 19.8\ ksi$, so $F_{CZ} = 19.8\ ksi$

Axial Tension

Note: No connection information is specified and no reduction of section is assumed.

$$F_t = 0.55 \cdot F_Y = 19.8 \text{ ksi}$$

Actual Stress

Actual axial stress, $f_a = 8.75\ /\ 12.6 = 0.694\ ksi$

Actual bending stress = $f_{bz} = 112.17 \cdot 12/62.7 = 1.789 \cdot 12 = 21.47\ ksi$, which exceeds F_{CZ}.

$$f_{bz}/F_{CZ} = 21.47/19.8 = 1.084$$

The critical moment occurs at the end node of the beam. So we use the AASHTO equation 10.43 in section 10-36 to calculate the design ratio for the end section.

$$\frac{f_a}{0.472F_y} + \frac{f_{bz}}{F_{bz}} + \frac{f_{by}}{F_{by}} = \frac{0.694}{0.472(36)} + \frac{21.467}{19.8} + 0 = 1.125$$

The critical stress ratio is thus 1.125. The value calculated by STAAD is 1.126.

Member 5

Size W 16X36, L = 5 ft., a = 10.6 in^2, Sz = 56.5 in^3

From observation Load case 3 will govern, Forces at the end are

- Fx = 14.02 kip (compression)
- Mz= 57.04 k-ft

Calculate the allowable stress as per Table 10.32.1A.

Bending Minor Axis

Allowable minor axis bending stress:

$$FTY = FTZ = 0.55 \cdot F_Y = 19.8 \text{ ksi}$$

Bending Major Axis

$$F_{cz} = \frac{50(10)^6 C_b}{S_{xc}}\left(\frac{I_{yc}}{l}\right)\sqrt{0.772\frac{J}{I_{yc}} + 9.87\left(\frac{d}{l}\right)^2} \leq 0.55F_y$$

Where:

$$C_b = 1.75 + 1.05(M1/M2)+0.3 \cdot (M1/M2)^2$$

$$M1 = 40.14,\ M2 = -684.4 \text{ so } C_b = 1.81$$

S_{zc} = Section modulus with respect to the compression flange = $448/(0.5 \cdot 15.86) = 56.5 \text{ in } in^3$

$$I_{YC} = tb^3/12 = 0.43 \cdot 6.99^3/12 = 12.238 \text{ in}^4$$

$$J = (2 \cdot 6.99 \cdot 0.43^3 + (15.86 - 2 \cdot 0.43) \cdot 0.29^3)/3 = 0.5 \text{ in}^4$$

$$F_{cz} = \frac{50(10)^6 1.81}{56.5}\left(\frac{12.238}{60}\right)\sqrt{0.772\frac{0.5}{12.238} + 9.87\left(\frac{15}{60}\right)^2}10^{-3} = 263.1ksi$$

which is larger than $0.55 \cdot F_Y = 19.8 \text{ ksi}$, so $F_{CZ} = 19.8 \text{ ksi}$

Axial Compression

Critical $(kL/r) = 1.0 \cdot 60/1.52 = 69.69$

As $(kL/r) < C_c$, the allow axial stress in compression is given by:

$$F_a = \frac{F_y}{F.S.}\left[1 - \frac{(kL/r)^2 F_y}{4\pi^2 E}\right] = \frac{36}{2.12}\left[1 - \frac{(39.474)^2 36}{4\pi^2 29,000}\right] = 16.15ksi$$

Actual Stress

Actual axial stress, $f_a = 14.02 / 10.6 = 1.323 \text{ ksi}$

The critical moment occurs at the end node of the beam. So we use the AASHTO equation 10.42 in section 10-36 to calculate the design ratio.

Actual bending stress = $f_{bz} = 57.04 \cdot 12/56.5 = 1.001 \cdot 12 = 12.115 \text{ ksi}$

$$(KL/r)_z = 1 \cdot 60/6.5 = 9.231$$

$$F_{ez} = \frac{\pi^2 E}{F.S.(kL/r)^2} = \frac{\pi^2 29,000}{2.12(9.231)^2} = 1,584.4ksi$$

From Table 10-36A, $C_{mz} = 0.85$

Equation 10-42

$$\frac{f_a}{F_a} + \frac{C_{mz} f_{bz}}{\left(1 - \frac{f_a}{F'_{ez}}\right)F_{bz}} + \frac{C_{my} f_{by}}{\left(1 - \frac{f_a}{F'_{ey}}\right)F_{by}} = \frac{1.323}{16.149} + \frac{0.85 \cdot 12.115}{\left(1 - \frac{1.323}{1,584.4}\right)19.8} + 0 = 0.602$$

For the end section, use Equation 10.43:

$$\frac{f_a}{0.472F_y} + \frac{f_{bz}}{F_{bz}} + \frac{f_{by}}{F_{by}} = \frac{1.323}{0.472(36)} + \frac{12.115}{19.8} + 0 = 0.689$$

The critical stress ratio is thus 0.689. The value calculated by STAAD is 0.690.

Member 6

Size W 16X36, L = 16 ft., a = 10.6 in^2, Sz = 56.5 in^3

From observation Load case 3 will govern, Forces at the end are

- Fx = 10.2 kip (compression)
- Mz= 62.96 k-ft

Calculate the allowable stress as per Table 10.32.1A.

Bending Minor Axis

Allowable minor axis bending stress:

$$FTY = FTZ = 0.55 \cdot F_Y = 19.8 \text{ ksi}$$

Bending Major Axis

$$F_{cz} = \frac{50(10)^6 C_b}{S_{xc}}\left(\frac{I_{yc}}{l}\right)\sqrt{0.772\frac{J}{I_{yc}} + 9.87\left(\frac{d}{l}\right)^2} \leq 0.55F_y$$

Where:

$$C_b = 1.75 + 1.05(M1/M2)+0.3 \cdot (M1/M2)^2$$

$$M1 = 8.947 \; M2 = 183.05 \text{ so } C_b = 1.69$$

S_{zc} = Section modulus with respect to the compression flange = $448/(0.5 \cdot 15.86) = 56.5 \text{ in } in^3$

$$I_{YC} = tb^3/12 = 0.43 \cdot 6.99^3/12 = 12.238 \text{ in}^4$$

$$J = (2 \cdot 6.99 \cdot 0.43^3 + (15.86 - 2 \cdot 0.43) \cdot 0.29^3)/3 = 0.5 \text{ in}^4$$

$$F_{cz} = \frac{50(10)^6 1.81}{56.5}\left(\frac{12.238}{192}\right)\sqrt{0.772\frac{0.5}{12.238} + 9.87\left(\frac{15}{192}\right)^2}10^{-3} = 287.9ksi$$

which is larger than $0.55 \cdot F_Y = 19.8 \text{ ksi}$, so $F_{CZ} = 19.8 \text{ ksi}$

Axial Compression

Critical $(kL/r) = 1.0 \cdot 192/1.52 = 126.3$

As $(kL/r) > C_c$, the allow axial stress in compression is given by:

$$F_a = \frac{\pi^2 E}{F.S.(kL/r)^2} = \frac{\pi^2 29,000}{2.12(126.3)^2} = 8.46ksi$$

Actual Stress

Actual axial stress, $f_a = 10.2 / 10.6 = 0.962 \text{ ksi}$

The critical moment occurs at the end node of the beam. So we use the AASHTO equation 10.42 in section 10-36 to calculate the design ratio.

Actual bending stress = $f_{bz} = 62.96 \cdot 12/56.5 = 1.114 \cdot 12 = 13.37 \text{ ksi}$

$(KL/r)_z = 1 \cdot 192/6.51 = 29.49$

$$F_{ez} = \frac{\pi^2 E}{F.S.(kL / r)^2} = \frac{\pi^2 29,000}{2.12(29.49)^2} = 155.2ksi$$

From Table 10-36A, $C_{mz} = 0.85$

Equation 10-42

$$\frac{f_a}{F_a} + \frac{C_{mz} f_{bz}}{\left(1 - \frac{f_a}{F'_{ez}}\right) F_{bz}} + \frac{C_{my} f_{by}}{\left(1 - \frac{f_a}{F'_{ey}}\right) F_{by}} = \frac{0.962}{8.46} + \frac{0.85 \cdot 13.37}{\left(1 - \frac{0.926}{155.2}\right) 19.8} + 0 = 0.691$$

For the end section, use Equation 10.43:

$$\frac{f_a}{0.472 F_y} + \frac{f_{bz}}{F_{bz}} + \frac{f_{by}}{F_{by}} = \frac{0.962}{0.472(36)} + \frac{13.37}{19.8} + 0 = 0.732$$

The critical stress ratio is thus 0.732. The value calculated by STAAD is 0.732

Note: The program gives this value when the slenderness check is suppressed (`MAIN 1.0` for member 6); otherwise the member fails as a compression member with a slenderness parameter greater than 120).

Member 7

Size W 16X36, L = 4 ft., a = 10.6 in^2, Sz = 56.5 in^3

From observation Load case 3 will govern, Forces at the midspan are

- Fx = 24.05 kip (tension)
- Mz= 62.96 k-ft

Calculate the allowable stress as per Table 10.32.1A

<u>Bending Minor Axis</u>

Allowable minor axis bending stress:

$FTY = FTZ = 0.55 \cdot F_Y = 19.8$ ksi

<u>Bending Major Axis</u>

$FCZ = 0.55 \cdot F_Y = 19.8$ ksi

<u>Axial Tension</u>

Note: No connection information is specified and no reduction of section is assumed.

$F_a = 0.55 \cdot F_Y = 19.8$ ksi

<u>Actual Stress</u>

Actual axial stress, $f_a = 24.05 / 10.6 = 2.268\ ksi$, hence, ok.

Actual bending stress = $f_{bz} = 62.96 \cdot 12/56.5 = 1.114 \cdot 12 = 13.37\ ksi$

So the combined ratio is

$f_a/F_a + f_{bz}/F_{TZ} + f_{by}/F_{TY} = 2.268/19.8 + 13.37/19.8 + 0 = 0.790$

The critical moment occurs at the end node of the beam. So we use the AASHTO equation 10.43 in section 10-36 to calculate the design ratio for the end section.

$$\frac{f_a}{0.472F_y} + \frac{f_{bz}}{F_{bz}} + \frac{f_{by}}{F_{by}} = \frac{2.268}{0.472(36)} + \frac{13.37}{19.8} + 0 = 0.809$$

The critical stress ratio is thus 0.809. The value calculated by STAAD is 0.809.

Member 8

Size L4x4x1/4, L = 7.07 ft., a = 1.938 in^2

From observation Load case 1 will govern, Forces

F_x = 23.04 kip (compression)

Calculate the allowable stress as per Table 10.32.1A

Axial Compression

Critical $(KL/r)_y = 1.0 \cdot 7.07 \cdot 12/0.795 = 106.7$

As $(kL/r) < C_c$, the allow axial stress in compression is given by:

$$F_a = \frac{F_y}{F.S.}\left[1 - \frac{(kL/r)^2 F_y}{4\pi^2 E}\right] = \frac{36}{2.12}\left[1 - \frac{(106.7)^2 36}{4\pi^2 29,000}\right] = 10.89 ksi$$

Actual Stress

Actual axial stress, $f_a = 23.04/1.938 = 11.88$ ksi

$f_a/F_a = 11.88/10.89 = 1.091$

The value calculated by STAAD is 1.091.

Member 9

Size L5x5x3/8, L = 5.657 ft, A = 3.61 in^2

From observation Load case 1 will govern, Forces

F_x = 48.44 kip (compression)

Calculate the allowable stress as per Table 10.32.1A

Axial Compression

Critical $(KL/r)_y = 1.0 \cdot 5.567 \cdot 12/0.99 = 68.57$

As $(kL/r) < C_c$, the allow axial stress in compression is given by:

$$F_a = \frac{F_y}{F.S.}\left[1 - \frac{(kL/r)^2 F_y}{4\pi^2 E}\right] = \frac{36}{2.12}\left[1 - \frac{(68.57)^2 36}{4\pi^2 29,000}\right] = 14.47 ksi$$

Actual Stress

Actual axial stress, $f_a = 48.44/3.61 = 13.42$ ksi

$f_a/F_a = 13.42/14.47 = 0.927$

The value calculated by STAAD is 0.928.

Comparison

Table 712: Comparison of results

Member Number	STAAD.Pro Results	Hand Calculation	Difference
1	1.216	1.217	none
2	1.091	1.092	none
3	1.207	1.203	none
4	1.130	1.126	none
5	0.691	0.689	none
6	1.052	0.732	43.7% [1]
7	0.812	0.808	<1%
8	1.114	1.091	2.1%
9	0.920	0.927	<1%

Note: ([1]) The ratio is 0.832 when the slenderness check is suppressed, which results in a 13.7% difference.

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AASHTO\AASHTO 17th Ed ASD - Design Frame.STD` is typically installed with the program.

V. AASHTO 2nd Ed LRFD - Design Beam

The following compares the solution of a design performed using STAAD.Pro against a hand calculation of steel design per the AASHTO (LRFD) code.

Details

Determine the allowable resistances (AASHTO LRFD, 1998 code) for the member of the structure as shown in figure. Also, perform a code check for the member based on the results of the analysis.

A 48 foot long, non-composite girder is assumed to be simply supported. The section is a plate girder with 16" x 1" plate flanges and a 34" x 3.6" plate web (36 in. total depth). All plates are grade 36 steel.

The beam is subject to a 9.111 kip/ft uniform load.

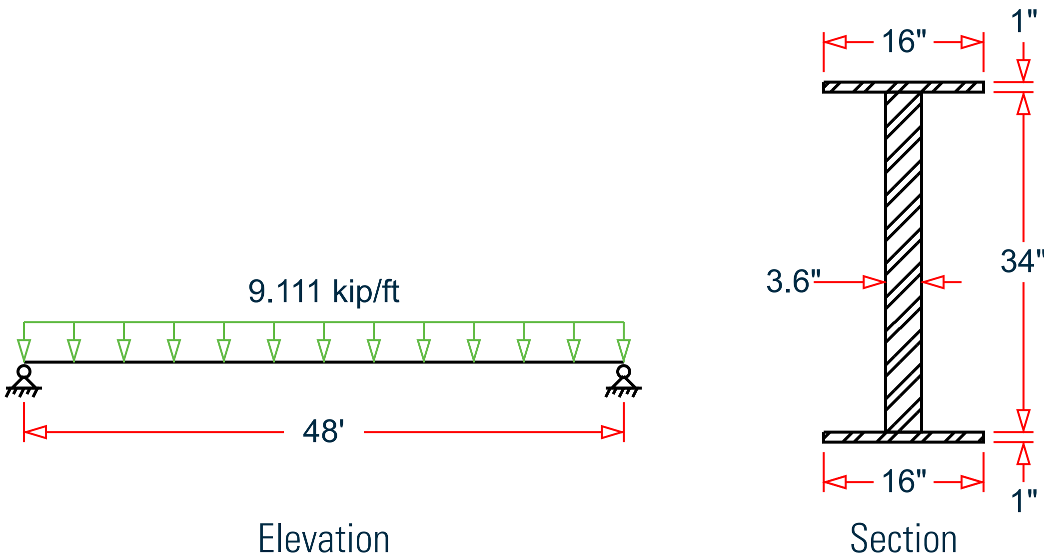

Figure 501: AASHTO LRFD verification example

Validation

$A = 154.4\ in^2$, $I_z = 21{,}594\ in^4$, $I_y = 814.9\ in^4$

$S_z = 21{,}594(2)/36 = 1{,}200\ in^3$

$$r_y = \sqrt{\frac{I_y}{A}} = \sqrt{\frac{814.9}{154.4}} = 2.30in$$

$$r_z = \sqrt{\frac{I_z}{A}} = \sqrt{\frac{21,\ 594}{154.4}} = 11.83in$$

From observation Load case 1 will govern,

M_z = 2,624 kip-ft

Axial Compression Capacity

Refer Clause 6.9.4 of the code.

$(kL/r)_y = 0.333 \times 576/ 2.297 = 83.50$

$(kL/r)_z = 1 \times 576/ 11.826 = 48.71$

$(kL/r)_{crit} = 83.50 < 120$, ok.

Calculation of Width/Thickness ratio for axial compression

Plate buckling coefficients taken from Table 6.9.4.2-1:

$k_w = 1.49$, $k_f = 0.56$

Slenderness ratio for the web:

$(d - 2 \cdot t_f)/t_w = (36 - 2 \cdot 1) / 3.6 = 9.444$

Slenderness ratio for the 1/2 flange:

$b_f/(2 \cdot t_f) = 16/(2 \cdot 1) = 8.0$

Critical ratio for web:

$$k_w\sqrt{\frac{E}{F_y}} = 1.49\sqrt{\frac{29,\ 000}{36}} = 42.29 > 9.444$$

Critical ratio for flange:

$$k_f\sqrt{\frac{E}{F_y}} = 0.56\sqrt{\frac{29,\ 000}{36}} = 15.89 > 8.0$$

Thus, **OK** [AASHTO LRFD Cl. 6.4.9.2]

Slenderness ratio about major and minor axis:

$$\lambda_z = \left(\frac{Kl}{r_z\pi}\right)^2\frac{F_y}{E} = \left(\frac{1.0 \cdot 576}{11.83\pi}\right)^2\frac{36}{29,\ 000} = 0.298$$

$$\lambda_y = \left(\frac{Kl}{r_y\pi}\right)^2\frac{F_y}{E} = \left(\frac{0.333 \cdot 576}{2.30\pi}\right)^2\frac{36}{29,\ 000} = 0.877$$

λ_y governs, thus $\lambda = 0.877$

$\lambda < 2.25$, so Equation 6.9.4.1-1 is used to determine the nominal compressive resistance

$P_n = 0.66^{\lambda}F_yA_s = 0.66^{0.877} \cdot 36 \cdot 154.4 = 3{,}861$ kips

The factored compressive resistance, $P_r = \varphi_c P_n = 0.9 \cdot 3{,}861 = 3{,}475\ kips$

Major Axis Bending Capacity

The compression flange moment of inertia:

$$I_{yc} = 1(16)^3/12 = 341.3 \text{ in}^4$$

$$I_{yc}/I_y = 341.3/814.9 = 0.419, > 0.1 \text{ and } < 0.9$$

Thus, **OK** [AASHTO LRFD Cl. 6.10.2.1]

$$\frac{2D_o}{t_w} = \frac{2(17)}{3.6} = 9.445 < 6.77\sqrt{\frac{E}{F_y}} = 6.77\sqrt{\frac{29,\ 000}{36}} = 192.1$$

Thus, **OK** [AASHTO LRFD Cl. 6.10.2.2]

Calculation of depth of the web in compression at the plastic moment, D_{cp}(Clause 6.10.3.3.2)

Area of Web, $A_w = (36 - 2 \times 1) \times 3.6 = 122.4 \ in^2$

Area of flange area in tension, A_{ft} = Area of flange in compression, $A_{fc} = 16 \times 1 = 16 \text{ in}^2$

$$D_{cp} = \left(\frac{D_w}{2A_w F_y}\right)Fy\left(A_{ft} + A_w - A_{fc}\right) = \left(\frac{34}{2 \cdot 122.4 \cdot 36}\right)36\left(16 + 122.4 - 16\right) = 17in$$

$$\frac{2D_{cp}}{t_w} = \frac{2(17)}{3.6} = 9.445 < 3.76\sqrt{\frac{E}{F_y}} = 3.76\sqrt{\frac{29,\ 000}{36}} = 108.1$$

Thus, **OK** [AASHTO LRFD Cl. 6.10.4.1.2]

$$\frac{b_f}{t_f} = \frac{16.0}{2(1.0} = 8.0 < 0.382\sqrt{\frac{E}{F_y}} = 0.382\sqrt{\frac{29,\ 000}{36}} = 10.98$$

Thus, **OK** [AASHTO LRFD Cl. 6.10.4.3]

Check clause 6.10.4.1.6a

$$(B/t)_{flange} < 0.75 \times (B/t)_{flange\_limit} = 0.75 \times 10.978$$

$$(D/T)_{web} < 0.75 \times (D/T)_{web\_limit} = 0.75 \times 108.057$$

Check clause 6.10.4.1.7

$$M_{pz} = P_z \times F_y = 1{,}600 \text{ in}^3(36 \text{ ksi}) = 57{,}614 \text{ in-k}$$

$$L_b = \left[0.124 - 0.0759\left(M_l \big/ M_{pz}\right)\right] \times \left[\frac{r_y E}{F_y}\right]$$

$$= \left[0.124 - 0.0759\left(0 \big/ 57,\ 614\right)\right] \times \left[\frac{2.30(29,\ 000)}{36}\right] = 229.5 \text{ in.}$$

Unsupported length, L_u = 576 in > L_b.; section is non-compact.

Check clause 6.10.4.1.9

A notional section comprised of the compression flange and one-third of the depth of the web in compression, taken about the vertical axis.

$$A_{rt} = A_{cf} + \left(\frac{c - t_f}{3}\right)t_w = 16 + \left(\frac{18 - 1.0}{3}\right)3.6 = 36.4in^2$$

$$I_{rt} = t_f\left[\left(\frac{c - t_f}{3}\right)\frac{t_w^3}{12}\right] = 1\left[\left(\frac{18 - 1}{3}\right)\frac{3.6^3}{12}\right] = 363.4in^4$$

$$r_{rt} = \sqrt{\frac{363.4}{36.4}} = 3.149in$$

$$L_p = 1.76\left(3.159\right)\sqrt{\frac{29,\ 000}{36}} = 159.8in$$

Lb > Lp

<u>Clause 6.10.4.2.6</u>

$$L_r = 4.44\sqrt{\frac{I_{yc}d}{S_{xc}}\frac{E}{F_y}} = 4.44\sqrt{\frac{341.3(36)}{1,\ 200}\frac{29,\ 000}{36}} = 403.3in$$

Minimum radius of gyration of the compression flange taken about the vertical axis:

$$r_t = \sqrt{\frac{I_{yc}}{A_{cf}}} = \sqrt{\frac{341.3}{16}} = 4.619in$$

Hybrid factor, Rh = 1.0 (For Homogeneous sections, Hybrid factors shall be taken as 1.0 per clause 6.10.4.3.1)

As per clause 6.10.4.3.2, Load-shedding factor, Rb

If area of the compression flange, A_{cf} ≥ the area of the tension flange, A_{tf}

l_b= 5.76

Dc = 17.00

$$\frac{2D_c}{t_w} = \frac{2(17)}{3.6} = 9.445 < L_b\sqrt{\frac{E}{F_y}} = 5.76\sqrt{\frac{29,\ 000}{36}} = 163.5$$

Thus:

$R_{b,comp} = R_{b,ten} = 1.0$

Lr < Lb

C_b = 1.75 + 1.05(M1/M2)+0.3x(M1/M2)^2

Here M1 = 0, M2 = 0 so C_b = 1.75

$$M_{nz,comp} = C_{bz}R_{b,comp}R_h\frac{M_y}{2}\left(\frac{L_r}{L_b}\right)^2 = 1.75\left(1.0\right)\left(1.0\right)\left[\frac{36(1,\ 200)}{2}\right]\left(\frac{408.4}{576}\right)^2 = 19,\ 000kip\ \cdot in$$

$$M_{nz,ten} = R_{b,ten}R_hF_yZ = 1.0\left(1.0\right)\left(36\right)\left(1,\ 200\right) = 43,\ 188kip\ \cdot in$$

M_{nz} = 19,000 kip ·in

Resisting Moment

$M_r = Q_f \cdot M_n$= 1.0 (19,000) = 19,000 kip ·in

Actual Moment = 31,488 kip·in

Interaction ratio = 31,488 / 19,000 = 1.657

Comparison

Table 713: Comparison of results

Value	Hand Calculations	STAAD.Pro Results	Difference
Critical Interaction Ratio	1.657	1.654	negligible

- *D1.A.5.3 Flexural Design Strength* (on page 1094)

Details

Verify the bending capacity of a single L4x4x1/4. The member is used as a 6 ft simple span subject to a uniform dead load of 0.05 kip/ft and a uniform live load of 0.15 kip/ft. The vertical leg of the single angle is up with the toe in compression. The material is ASTM A36.

Validation

Note: When assigning the angle, it should be given in a beta angle as the geometrical axis and principal axis are different, and in STAAD.Pro the calculation is done with reference with the principal axis. To match the geometric axis used in AISC 360-16, a BETA angle is assigned to the member in STAAD.Pro.

The nominal flexural strength, M_n , shall be the lowest value obtained to the limit states of yielding (plastic moment), lateral-torsional buckling, and leg local buckling.

Ultimate load (for LRFD):

$$w_{ux} = 1.2(0.05) + 1.6(0.15) = 0.30 \text{ kip/ft}$$

$$M_{ux} = w_{ux}L^2/8 = (0.30)(6)^2/8 = 1.35 \text{ kip·ft}$$

Service level load (for ASD):

$$w_{ax} = 0.05 + 0.15 = 0.20 \text{ kip/ft}$$

$$M_{ax} = w_{ax}L^2/8 = (0.20)(6)^2/8 = 0.90 \text{ kip·ft}$$

Note: Only bending about the major axis is compared as bending due to loads is about the geometrix X-X axis.

Yielding

The nominal flexural strength in the limit state of flexural yielding is:

$$M_n = 1.5M_y = 1.5F_yS_x \qquad \text{Eq. F10-1}$$

$$M_n = 1.5(36 \text{ ksi})(1.03 \text{ in}^3) = 55.6 \text{ in·kip}$$

Lateral Torsional Buckling

For single angles bending about a geometric axis with no lateral-torsional restraint:

$$M_y = 0.8.F_yS_x \qquad \text{F10-2}$$

$$M_y = 0.8(36 \text{ ksi})(1.03 \text{ in}^3) = 29.7 \text{ in·kip}$$

For bending about one of the geometric axes of an equal-leg angle without axial compression, no lateral-torsional restraint, and with maximum compression in the toe:

$$M_{cr} = \frac{0.58Eb^4tC_b}{L_b^2}\left[\sqrt{1 + 0.88\left(\frac{L_bt}{b^2}\right)^2} - 1\right] \qquad \text{Eq. F10-5a}$$

where

C_b = *1.14* from AISC Table 3-1.Manual

$$M_{cr} = \frac{0.58(29{,}000ksi)(4.0\ in)^4(0.25\ in)(1.14)}{(6\ ft\ \times\ 12\ in/ft)^2}\left\{\sqrt{1+0.88\left[\frac{(6\ ft\ \times\ 12\ in/ft)(0.25\ in)}{(4.0\ in)^2}\right]^2}-1\right\} = 107\ in\cdot kips$$

$M_y\ /\ M_{cr} = 29.7\ /\ 107 = 0.278 < 1.0$; therefore, AISC eq. F 10-2 is applicable:

$$M_n = \left(1.92 - 1.17\sqrt{\frac{M_y}{M_{cr}}}\right)M_y \le 1.5M_y \qquad \text{Eq. F10-2}$$

$$M_n = \left(1.92 - 1.17\sqrt{\frac{29.7}{107}}\right)29.7 = 38.7\ in\cdot kip < 1.5(29.7)\ =\ 44.6\ in\cdot kip$$

Leg Loca Buckling

AISC section F10.3 applies when the toe of the leg is in compression. Check the slenderness of the leg in compression:

$$\lambda = b/t = 4.0 / 0.25 = 16.0$$

Determine the compact and noncompact slenderness ratios from Table B4.1b, Case 12:

$$\lambda_p = 0.54\sqrt{\frac{E}{F_y}} = 0.54\sqrt{\frac{29{,}000}{36}} = 15.3$$

$$\lambda_r = 0.91\sqrt{\frac{E}{F_y}} = 0.91\sqrt{\frac{29{,}000}{36}} = 25.8$$

$\lambda_p < \lambda < \lambda_r$, therefore the leg is noncompact in flexure.

$$S_c = 0.80S_x = 0.80\ (1.03\ in^3) = 0.824\ in^3$$

$$M_n = F_yS_c\left[2.43 - 1.72\left(\frac{b}{t}\right)\sqrt{\frac{F_y}{E}}\right] \qquad \text{Eq. F10-6}$$

$$M_n = (36)(0.824)\left[2.43 - 1.72(16)\sqrt{\frac{36}{29{,}000}}\right] = 43.3\ in\cdot kip$$

Available Flexural Strength

The lateral-torsional buckling limit state governs.

$$M_n = 38.7\ in\cdot kip = 3.23\ ft\cdot kip$$

LRFD

$$\phi_b = 0.90$$

$$\phi_bM_n = 0.90(3.23) = 2.91\ ft\text{-}kip > 1.35\ kip\cdot ft$$

ASD

$$\Omega_b = 1.67$$

$$M_n/\Omega_b = 3.23/1.67 = 1.93\ ft\text{-}kip > 0.90\ kip\cdot ft$$

Results

Table 714: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Lateral-torsional buckling, about X axis (ft·kips) LRFD	2.91	2.940	1.0%	
Lateral-torsional buckling, about X axis (ft·kips) ASD	1.93	1.956	1.3%

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       U                Z          Axis typically parallel to the sections
principal major axis.
       V                Y          Axis typically parallel to the sections
principal minor axis.
       Z                X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz               FX         Axial force.
       Vy               FY         Shear force along minor axis.
       Vx               FZ         Shear force along major axis.
       Tz               MX         Torsional moment.
       My               MY         Bending moment about minor axis.
       Mx               MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
```

```
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ALL UNITS ARE - KIP  FEET (UNLESS OTHERWISE Noted).
 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       U               Z          Axis typically parallel to the sections
principal major axis.
       V               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
```

```
 ------------    -----------     -------------
      Pz              FX         Axial force.
      Vy              FY         Shear force along minor axis.
      Vx              FZ         Shear force along major axis.
      Tz              MX         Torsional moment.
      My              MY         Bending moment about minor axis.
      Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 C Flex Mem F.2-1A

Verify the flexural yielding capacity of a continuously braced channel member subject to major axis bending per AISC 360-16.

- *D1.A.5.3 Flexural Design Strength* (on page 1094)

Details

Verify the bending capacity of a C15x33.9. The member is used as a 25 ft simple span subject to a uniform dead load of 0.23 kip/ft and a uniform live load of 0.69 kip/ft. The member is continuously braced. The material is ASTM A36.

Validation

Ultimate load (for LRFD):

$$w_u = 1.2(0.23) + 1.6(0.6) = 1.38 \text{ kip/ft}$$

$$M_u = w_u L^2/8 = (1.38)(25)^2/8 = 108 \text{ kip·ft}$$

Service level load (for ASD):

$$w_a = 0.23 + 0.39 = 0.92 \text{ kip/ft}$$

$$M_a = w_a L^2/8 = (0.92)(25)^2/8 = 71.9 \text{ kip·ft}$$

Note: Per the User Note in AISC *Specification* Section F2, all ASTM A36 channel shapes are compact.

Yielding Limit State

$$M_n = M_p = F_y Z_x \qquad \text{Eq. F2-1}$$

$$M_n = (36 \text{ ksi})(50.8 \text{ in}^3) = 1{,}830 \text{ in·kip} = 152.5 \text{ ft·kip}$$

Available Flexural Strength

A continuously braced channel section is governed by the yielding limit state.

LRFD

$$\phi_b = 0.90$$

$$\phi_b M_n = 0.90(152.5) = 137 \text{ ft-kip} > 108 \text{ kip·ft}$$

ASD

$$\Omega_b = 1.67$$

$$M_n/\Omega_b = 152.5/1.67 = 91.3 \text{ ft-kip} > 71.9 \text{ kip·ft}$$

Results

Table 715: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Flexural yielding capacity, about X axis (ft·kips) LRFD	137	137.2	negligible	
Flexural yielding capacity, about X axis (ft·kips) ASD	91.3	91.26	negligible

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 ========================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ALL UNITS ARE - KIP  FEET (UNLESS OTHERWISE Noted).
 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
```

```
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase 
that
       produced the worst case design ratio for flexure/compression Capacity 
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the 
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y), 
while
       the results for shear are reported as being for shear forces �along� 
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear 
along
       the X axis.

V.AISC 360-16 C LTB Test F.2B

Verify the flexural capacity of a channel member with bracing at ends and fifth points per AISC 360-16.

- *D1.A.5.3 Flexural Design Strength* (on page 1094)

Details

Verify the bending capacity of a C15x33.9. The member is used as a 25 ft simple span subject to a uniform dead load of 0.23 kip/ft and a uniform live load of 0.69 kip/ft. The member is braced at the supports and at fifth points. The material is ASTM A36.

Validation

Ultimate load (for LRFD):

$$w_u = 1.2(0.23) + 1.6(0.6) = 1.38 \text{ kip/ft}$$

$$M_u = w_u L^2/8 = (1.38)(25)^2/8 = 108 \text{ kip·ft}$$

Service level load (for ASD):

$$w_a = 0.23 + 0.39 = 0.92 \text{ kip/ft}$$

$$M_a = w_a L^2/8 = (0.92)(25)^2/8 = 71.9 \text{ kip·ft}$$

Note: Per the User Note in AISC *Specification* Section F2, all ASTM A36 channel shapes are compact.

From the AISC *Manual* Table 3-8, for a C15x33.9:

$$L_p = 3.75 \text{ ft}$$

$$L_r = 14.5 \text{ ft}$$

The unbraced length of the member:

$$L = 25.0/5 = 5 \text{ ft}$$

For a compact channel with $L_p < L_b \leq L_r$, the lesser of the flexural yielding or inelastic lateral-torsional buckling limit states will govern the available flexural strength.

<u>Lateral-Torsional Buckling Limit State</u>

$$M_n = M_p = F_y Z_x \qquad \text{Eq. F2-1}$$

$$M_n = (36 \text{ ksi})(50.8 \text{ in}^3) = 1{,}830 \text{ in·kip} = 152 \text{ ft·kip}$$

The nominal flexural strength in the lateral-torsional buckling limit state is:

$$M_n = C_b\left[M_p - \left(M_p - 0.75F_y S_x\right)\left(\frac{L_b - L_p}{L_r - L_p}\right)\right] \leq M_p \qquad \text{Eq. F2-2}$$

where

C_b = *1.0* for the center segment of a uniformly loaded beam braced at ends and fifth points.

$$M_n = 1.0\left\{1{,}830 - \left[1{,}830 - 0.75(36)(42.0)\right]\left(\frac{5.0 - 3.75}{14.5 - 3.75}\right)\right\} = 1{,}740\ in \cdot kip$$

M_n = 145 ft·kip

<u>Available Flexural Strength</u>

By observation, the section is governed by the lateral-torsional buckling limit state.

LRFD

$\phi_b = 0.90$

$\phi_b M_n = 0.90(145) = 131$ ft-kip > 108 kip·ft

ASD

$\Omega_b = 1.67$

$M_n/\Omega_b = 145/1.67 = 86.8$ ft-kip > 71.9 kip·ft

Results

Table 716: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Lateral-torsional buckling, about X axis (ft·kips) LRFD	131	130.4	negligible	
Lateral-torsional buckling, about X axis (ft·kips) ASD	86.8	86.75	negligible

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
```

```
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description

       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ======================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
```

```
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 HSST Compact Flange F.6

Verify the flexural strength of a square HSS flexural member with compact flanges per the AISC 360-16 code.

Details

Verify the bending capacity of a HSST 3.5x3.5x1/8. The member is used as a 7.5 ft simple span subject to a uniform dead load of 0.145 kip/ft and a uniform live load of 0.435 kip/ft. The member is continuously braced. The material is ASTM A500 Grade C ($F_y = 50\ ksi$).

Validation

Ultimate load (for LRFD):

$w_u = 1.2(0.145) + 1.6(0.435) = 0.87$ kip/ft

$M_u = w_u L^2/8 = (0.87)(7.5)^2/8 = 6.12$ kip·ft

Service level load (for ASD):

$w_a = 0.145 + 0.435 = 0.58$ kip/ft

$M_a = w_a L^2/8 = (0.58)(7.5)^2/8 = 4.08$ kip·ft

From the AISC Manual Table 3-13:

LRFD

$\phi_b M_n = 7.21$ ft·k

ASD

$M_n/\Omega_b = 4.79$ ft·k

However, this does *not* account for using the design wall thickness for calculating the slenderness ratio for the flange local buckling as per section B4.2.

$b\backslash t = [3.5 - 3\times(0.93\times0.125)] / (0.93\times0.125) = 27.1$

$$\lambda_p = 1.12\sqrt{\frac{E}{F_y}} = 1.12\sqrt{\frac{29{,}000}{50}} = 26.97 < 27.1$$

Note: STAAD.Pro uses the design wall thickness for this calculation and thus considers the section as non-compact.

$M_p = Z\times F_y = 1.93\times50 = 96.5$ in·k = 8.04 ft·k

For non-compact sections:

$$M_n = M_p - \left(M_p - F_y S\right)\left(3.57\frac{b}{t_f}\sqrt{\frac{F_y}{E}} - 4.0\right) \leq M_p \quad \text{[Eqn. F7-2]}$$

$$M_n = 96.5 - \left(96.5 - 50 \times 1.66\right)\left(3.57 \times 27.1\sqrt{\frac{50}{29,\ 000}} - 4.0\right) = 96.27 \text{ in}\cdot\text{k} = 8.02 \text{ ft}\cdot\text{k}$$

LRFD

$\phi_b M_n = 7.22$ ft·k

ASD

$M_n/\Omega_b = 4.80$ ft·k

Results

Table 717: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Flange slenderness	compact	non-compact	n/a	The reference does not consider the design wall thickness, which increases the slenderness ratio just above the plastic limit.
$\phi_b M_n$ (ft·k)	7.22	7.209	negligible	
M_n/Ω_b (ft·k)	4.8	4.796	negligible

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description

```

```
 *** DESIGN MESSAGES ***:
 ======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ALL UNITS ARE - KIP  FEET (UNLESS OTHERWISE Noted).
 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
```

```
       Pz                FX         Axial force.
       Vy                FY         Shear force along minor axis.
       Vx                FZ         Shear force along major axis.
       Tz                MX         Torsional moment.
       My                MY         Bending moment about minor axis.
       Mx                MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 HSST NonCompact Flange F.7

Verify the available flexural strength of a Rectangular HSS flexural member with non-compact flanges per the AISC 360-16 code.

Details

Verify the bending capacity of a HSST 10x6x3/16. The member is used as a 21 ft simple span subject to a uniform dead load of 0.15 kip/ft and a uniform live load of 0.4 kip/ft. The member is braced at end points only. The material is ASTM A500 Grade C (F_y = *50 ksi*).

Validation

Ultimate load (for LRFD):

$w_u = 1.2(0.15) + 1.6(0.4) = 0.82$ kip/ft

$M_u = w_u L^2/8 = (0.82)(21)^2/8 = 45.2$ kip·ft

Service level load (for ASD):

$w_a = 0.15 + 0.4 = 0.55$ kip/ft

$M_a = w_a L^2/8 = (0.55)(21)^2/8 = 30.3$ kip·ft

Flange slenderness ratio

$\lambda = b/t_f = 31.5$ (From Reference 1, Table 1-11)

$$\lambda_p = 1.12\sqrt{\frac{E}{F_y}} = 1.12\sqrt{\frac{29,\ 000}{50}} = 27.0$$

$$\lambda_r = 1.40\sqrt{\frac{E}{F_y}} = 1.40\sqrt{\frac{29,\ 000}{50}} = 33.7$$

$\lambda_p < \lambda < \lambda_r$, therefore, the flange is non-compact .

Web slenderness ratio:

$\lambda = h/t_f = 54.5$ (From Reference 1, Table 1-11)

$$\lambda_p = 2.42\sqrt{\frac{E}{F_y}} = 2.42\sqrt{\frac{29,\ 000}{50}} = 58.3$$

$\lambda < \lambda_p$, therefore, the web is compact (limit state of web local buckling need not be checked).

<u>Flange Local Buckling</u>

$M_p = F_y Z_x = 50 \times 18.0 = 900$ in·k = 75 ft·k

For non-compact sections:

$$M_n = M_p - \left(M_p - F_y S\right)\left(3.57\frac{b}{t_f}\sqrt{\frac{F_y}{E}} - 4.0\right) \le M_p \qquad \text{[Eqn. F7-2]}$$

$$M_n = 900 - \left(900 - 50 \times 14.9\right)\left(3.57 \times 31.5\sqrt{\frac{50}{29,\ 000}} - 4.0\right) = 796 \text{ in}\cdot\text{k} = 66.4 \text{ ft}\cdot\text{k}$$

<u>Yielding and Lateral-Torsional Buckling</u>

$L_b = 21$ ft = 252 in

$$L_p = 0.13Er_y\frac{\sqrt{JA_g}}{M_p} = 0.13(29,\ 000)(2.52)\frac{\sqrt{73.8 \times 5.37}}{900} = 210 \text{ in}$$

$$L_p = 2Er_y\frac{\sqrt{JA_g}}{M_p} = 2(29,\ 000)(2.52)\frac{\sqrt{73.8 \times 5.37}}{900} = 5,\ 580 \text{ in}$$

The moment at the quarter and three-quarter points on a simply supported beam under uniform distributed load (Table 3-23, Case 1 in Reference 1) is $3/32wl^2$, which is simply 3/4 of the maximum moment at midspan. In other words, $M_A = M_C = 3/4 \times M_B$. Therefore, the lateral-torsional buckling modification factor becomes:

$$C_b = \frac{12.5M_{max}}{2.5M_{max} + 3M_A + 4M_B + 3M_C} = \frac{12.5(1.0)}{2.5(1.0) = 3(0.75) + 4(1.0) = 3(0.75)} = 1.14 \qquad \text{[Eqn. F1-1]}$$

$L_p < L_b < L_r$, therefore the nominal moment in the lateral-torsional limit state is given by:

$$M_n = C_b\left[M_p - \left(M_p + 0.7F_yS_x\right)\left(\frac{L_b - L_p}{L_r - L_p}\right)\right] \le M_p$$ [Eqn. F7-10]

$$M_n = 1.14\left\{900 - \left[900 + 0.7(50)(14.9)\right]\left(\frac{252 - 210}{5,\ 580 - 210}\right)\right\} = 1,\ 020\ \text{in}\cdot\text{k} = 85\ \text{ft}\cdot\text{k}$$

Flange buckling controls, $M_n = 66.4\ ft\cdot k$

LRFD

$$\phi_bM_n = 59.8\ \text{ft}\cdot\text{k}$$

ASD

$$M_n/\Omega_b = 39.8\ \text{ft}\cdot\text{k}$$

Results

Table 718: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Flange classification	non-compact	non-compact	none	
ϕ_bM_n (ft·k)	59.8	59.80	none	
M_n/Ω_b (ft·k)	39.8	39.79	negligible

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description

```
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase 
that
       produced the worst case design ratio for flexure/compression Capacity 
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the 
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y), 
while
       the results for shear are reported as being for shear forces �along� 
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear 
along
       the X axis.

 ALL UNITS ARE - KIP  FEET (UNLESS OTHERWISE Noted).
 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 HSST Slender Flange F.8

Verify the available flexural strength of a square HSS flexural member with slender flange per AISC 360-16 code.

Details

Verify the bending capacity of a HSST 18x8x3/16. The member is used as a 21 ft simple span subject to a uniform dead load of 0.125 kip/ft and a uniform live load of 0.375 kip/ft. The member is continuously braced. The material is ASTM A500 Grade C ($F_y = 50\ ksi$).

Validation

Ultimate load (for LRFD):

$$w_u = 1.2(0.125) + 1.6(0.375) = 0.75 \text{ kip/ft}$$

$$M_u = w_u L^2/8 = (0.75)(21)^2/8 = 41.3 \text{ kip·ft}$$

Service level load (for ASD):

$$w_a = 0.125 + 0.375 = 0.50 \text{ kip/ft}$$

$$M_a = w_a L^2/8 = (0.50)(21)^2/8 = 27.6 \text{ kip·ft}$$

Flange slenderness ratio

$$\lambda = b/t_f = 43.0 \text{ (From Reference 1, Table 1-12)}$$

$$\lambda_r = 1.40\sqrt{\frac{E}{F_y}} = 1.40\sqrt{\frac{29,000}{50}} = 33.7$$

$\lambda > \lambda_r$, therefore, the flange is slender.

Web slenderness ratio:

$\lambda = h/t_f = 54.4$ (From Reference 1, Table 1-12)

$$\lambda_p = 2.42\sqrt{\frac{E}{F_y}} = 2.42\sqrt{\frac{29,000}{50}} = 58.3$$

$\lambda < \lambda_p$, therefore, the web is compact (limit state of web local buckling need not be checked).

Flange Local Buckling

$M_n = F_y S_e$ [Eqn. F7-3]

where

S_e = the effect section modulus $\frac{I_{eff}}{(H / 2)}$

I_{eff} = the effective moment of inertia. A simplified method as presented in Reference 2 is used, with the effective flange width:

$$I_{eff} \approx I_x - \left(\Sigma \frac{bt^3}{12} + \Sigma a d^2\right)$$

b_e = the effective flange width of the compression flange, per Section F7.2(c) of Reference 1:

$$= 1.92 t_f \sqrt{\frac{E}{F_y}}\left(1 - \frac{0.38}{b / t_f}\sqrt{\frac{E}{F_y}}\right) \leq b$$

b = usable flange width

= b - 3t = 8.0 - 3(0.174) = 7.48 in

$$b_e = 1.92(0.174)\sqrt{\frac{29,000}{50}}\left(1 - \frac{0.38}{43.0}\sqrt{\frac{29,000}{50}}\right) = 6.33 \text{ in}$$

The portion of the compression flange that is not effective: $b - b_e = 7.48 - 6.33 = 1.15$ *in*

$$I_{eff} = 54.4 - 2\left[\frac{1.15(0.174)^3}{12} + 1.15(0.174)\left(\frac{8.0 - 0.175}{2}\right)^2\right] = 48.3 \text{ in}^4$$

$$S_e = \frac{48.3}{8.0/2} = 12.1 \text{ in}^3$$

$M_n = 50 \times 12.1 = 605$ in·k = 50.4 ft·k

LRFD

$\phi_b M_n = 45.4$ ft·k

ASD

$M_n/\Omega_b = 30.2$ ft·k

Results

Table 719: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Flange slenderness	slender	slender	none	
$\phi_b M_n$ (ft·k)	45.4	46.28	1.9%	
M_n / Ω_b (ft·k)	30.2	30.79	2.0%

 ALL UNITS ARE - KIP  FEET (UNLESS OTHERWISE Noted).
 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
```

```
       based on the code clause in AISC 360-16 will not be shown in the 
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y), 
while
       the results for shear are reported as being for shear forces �along� 
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear 
along
       the X axis.
 *** ABBREVIATIONS ***:

       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 ========================
```

```
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 I Minor Axis Bending F.5

Check the minor axis bending capacity of an I-shaped flexural member per the AISC 360-16 code.

Details

Verify the bending capacity of a W12x58 in bending about the weak axis The member is used as a 15 ft simple span subject to a uniform dead load of 0.667 kip/ft and a uniform live load of 2.0 kip/ft. The member is braced at end points only. The material is ASTM A992 ($F_y = 50\ ksi$).

Validation

Ultimate load (for LRFD):

$$w_u = 1.2(0.667) + 1.6(2.0) = 4.0 \text{ kip/ft}$$

$$M_u = w_u L^2/8 = (4.0)(15)^2/8 = 112.5 \text{ kip·ft}$$

Service level load (for ASD):

$$w_a = 0.667 + 2.0 = 2.67 \text{ kip/ft}$$

$$M_a = w_a L^2/8 = (2.67)(15)^2/8 = 75.1 \text{ kip·ft}$$

Per the User Note in F6.2, the W12x58 has compact flanges in minor axis bending. Therefore, flange local buckling does not control. Yielding

$$M_p = F_y Z_y \le 1.6 F_y S_y \quad \text{[Eqn. F6-1]}$$

$$M_p = 50 \times 32.5 = 1{,}625 \text{ in}\cdot\text{k} = 135.4 \text{ ft}\cdot\text{k}$$

$$1.6 \times 50 \times 21.4 = 1{,}712 \text{ in}\cdot\text{k} = 142.7 \text{ ft}\cdot\text{k}$$

$$M_p = 135.4 \text{ ft}\cdot\text{k}$$

LRFD

$$\phi_b M_n = 121.9 \text{ ft}\cdot\text{k}$$

ASD

$$M_n/\Omega_b = 81.2 \text{ ft}\cdot\text{k}$$

Results

Table 720: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_{ny}$ (ft·k)	121.9	121.9	none	
M_{ny}/Ω_b (ft·k)	81.2	81.09	negligible

 ALL UNITS ARE - KIP  FEET (UNLESS OTHERWISE Noted).
 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
```

```
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.

       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
```

```
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 Pipe F.9

Verify the available flexural strength of a compact pipe member per the AISC 360-16 code.

Details

Verify the bending capacity of an 8" x-strong pipe. The member is used as a 16 ft simple span. The member is braced only at end points. The material is ASTM A53 Grade B ($F_y = 35\ ksi$).

Validation

Slenderness ratio

$$\lambda = D/t = 18.5 \text{ (From Reference 1, Table 1-14)}$$

$$\lambda_p = 0.07E/F_y = 0.07 \times (29{,}000 / 35) = 58$$

$\lambda < \lambda_p$, therefore, the section is compact (limit state of flange local buckling need not be checked).

$$\frac{0.45E}{F_y} = \frac{0.45(29{,}000)}{35} = 373 > 18.5$$

Therefore, section F8.1 (Round HSS) of Reference 1 applies:

$$M_n = M_p = F_y Z = 35 \times 31.0 = 1{,}085 \text{ in}\cdot\text{k} = 90.4 \text{ ft}\cdot\text{k}$$

LRFD

$$\phi_b M_n = 81.38 \text{ ft}\cdot\text{k}$$

ASD

$$M_n/\Omega_b = 54.14 \text{ ft}\cdot\text{k}$$

Results

Table 721: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k)	81.38	81.38	none	
M_n / Ω_b (ft·k)	54.14	54.14	none

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
```

```
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
```

```
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 W Flex Memb F.1-1A

Verify the available flexural strength of a continuously braced wide-flange member per the AISC 360-16 code.

Details

Verify the bending capacity of a W18x50. The member is used as a 35 ft simple span. The member is continuously braced. The material is ASTM A992 ($F_y = 50\ ksi$).

Validation

Per the User Note in F2, the W18x35 has compact flanges in major axis bending. Therefore, flange local buckling does not control. Further, as the member is continuously braced, lateral-torsional buckling does not control.

Yielding

$$M_n = M_p = F_y Z_x = 50 \times 101 = 5{,}050\ \mathrm{in \cdot k} = 420.8\ \mathrm{ft \cdot k}$$

LRFD

$$\phi_b M_n = 378.8\ \mathrm{ft \cdot k}$$

ASD

$$M_n / \Omega_b = 252.0\ \mathrm{ft \cdot k}$$

Results

Table 722: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k)	378.8	378.8	none	
M_n / Ω_b (ft·k)	252.0	252.0	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 W Flex Memb F.STD` is typically installed with the program.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description

       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
```

```
      Vy              FY         Shear force along minor axis.
      Vx              FZ         Shear force along major axis.
      Tz              MX         Torsional moment.
      My              MY         Bending moment about minor axis.
      Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase 
that
       produced the worst case design ratio for flexure/compression Capacity 
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the 
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y), 
while
       the results for shear are reported as being for shear forces �along� 
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear 
along
       the X axis.

V. AISC 360-16 W Flexural Check LRFD

Verify the flexural yielding strength and lateral torsional buckling of an I section using the LRFD method per AISC 360-16.

References

1. *Steel Construction Manual*, 15th Edition, American Institute of Steel Construction, 2017

Details

Verify the flexural yielding strength and lateral torsional buckling of an I section (W12X90) gr. ASTM A992 material, with a member length of 41'-8", and a concentrated moment of 35,000 in-kip applied at midspan. The member is unbraced along its length.

Validation

Flexural yielding about X axis

As the section is compact, nominal flexural yielding strength about X axis is:

$$M_{nx} = f_y \times Z_{xx} = 65 \text{ ksi} \times 311 \text{ in}^3 = 20{,}215 \text{ in}\cdot\text{kip} \qquad \text{(F2-1, ref. 1)}$$

$$M_x = \phi_c \times M_{nx} = 0.9(20{,}215 \text{ in}\cdot\text{kip}) = 18{,}193.5 \text{ in}\cdot\text{kip}$$

Flexural yielding about Y axis

As this is the minor axis, nominal flexural yielding strength about Y axis is:

$$M_{ny} = f_y \times Z_{yy} = 65 \text{ ksi} \times 143 \text{ in}^3 = 9{,}295 \text{ in}\cdot\text{kip} \qquad \text{(F6-1, ref. 1)}$$

$$M_y = \phi_c \times M_{ny} = 0.9(9{,}295 \text{ in}\cdot\text{kip}) = 8{,}365.5 \text{ in}\cdot\text{kip}$$

Lateral torsional buckling about X axis

$$r_y = \sqrt{I_{yy} / A_g} = 3.243\text{in}^2$$

limiting laterally unbraced length for the yielding limit state:

$$L_p = 1.76 \times r_y \sqrt{\frac{E}{f_y}} = 120.56\text{in} \qquad \text{(F2-5, ref. 1)}$$

$$r_{ts} = \sqrt{\frac{\sqrt{I_{yy} \times C_w}}{S_{xx}}} = 3.769\text{in} \qquad \text{(F2-7, ref. 1)}$$

For an I section, C = 1 (per F2-28a in ref. 1). The limiting unbraced length for the inelastic lateral-torsional buckling limit state is:

$$h_0 = d - t_f = 12.66 \text{ in}$$

$$L_r = 1.95 \times r_{ts} \frac{E}{0.7F_y} \sqrt{\frac{Jc}{S_{xx} h_0} + \sqrt{\left(\frac{Jc}{S_{xx} h_0}\right)^2 + 6.76\left(\frac{0.7F_y}{E}\right)^2}} = 810.27\text{in}$$

$$L_p < L_b = 500 \text{ in} < L_r$$

$$C_b = \frac{12.5M_{max}}{2.5M_{max} + 3M_A + 4M_B + 3M_c} = \frac{12.5(20,\ 000)}{2.5(20,\ 000) + 3(10,\ 000) + 4(20,\ 000) + 3(10,\ 000)} = 1.316$$

$$M_p = f_y \times Z_{xx} = 65 \text{ ksi} \times 311 \text{ in}^3 = 20{,}215 \text{ in}\cdot\text{kip}$$

Nominal LTB strength:

$$M_n = C_b\left[M_p - \left(M_p - 0.7F_yS_x\right)\left(\frac{L_b - L_p}{L_r - L_p}\right)\right] \le M_p$$

M_n = 20,611.4 in·kip > M_p

$\phi_c M_{nx}$ = 0.9(20,215 in·kip) = 18,193.5 in·kip

Results

Table 723: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Flexural yielding capacity, X axis (in·kip)	18,194	18,190	negligible	
Flexural buckling capacity, Y axis (in·kip)	8366	8366	none	
Lateral-torsional buckling about X axis (in·kip)	18,194	18,190	negligible

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -

       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 ========================
```

```
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 W Local Buckling F.3A

Verify the available flexural local buckling capacity of a wide-flange section that is continuously braced with major axis bending per the AISC 360-16 code.

Details

Verify the bending capacity of a W21x48. The member is used as a 40 ft simple span. The member is continuously braced. The material is ASTM A992 ($F_y = 50\ ksi$).

Validation

Flange Slenderness

$$\lambda = b_f / 2t_f = 9.47 \text{ (from Table 1-1 of Reference 1)}$$

$$\lambda_p = 0.38\sqrt{\frac{E}{F_y}} = 0.38\sqrt{\frac{29,000}{50}} = 9.15$$

$$\lambda_r = 1.0\sqrt{\frac{E}{F_y}} = 1.0\sqrt{\frac{29,000}{50}} = 24.1$$

$\lambda_p < \lambda < \lambda_r$, therefore, the flange is non-compact .

Flange Local Buckling

$$M_p = F_y Z_x = 50 \times 107 = 5{,}350 \text{ in}\cdot\text{k} = 445.8 \text{ ft}\cdot\text{k}$$

For non-compact sections:

$$M_n = M_p - \left(M_p - 0.7F_y S_x\right)\left(\frac{\lambda - \lambda_p}{\lambda_r - \lambda_p}\right) \le M_p \quad \text{[Eqn. F3-1]}$$

$$M_n = 5,350 - \left[5,350 - 0.7(50)(93.0)\right]\left(\frac{9.47 - 9.15}{24.1 - 9.15}\right) = 5,303 \text{ in}\cdot\text{k} = 441.9 \text{ ft}\cdot\text{k}$$

Since the member is continuously braced, lateral torsional buckling does not control.

LRFD

$$\phi_b M_n = 397.7 \text{ ft}\cdot\text{k}$$

ASD

$$M_n/\Omega_b = 264.6 \text{ ft}\cdot\text{k}$$

Results

Table 724: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k)	397.7	398.0	negligible	
M_n/Ω_b (ft·k)	264.6	264.8	negligible

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 ========================
```

```
    1. Section classification reported is for the cross section and loadcase 
that
       produced the worst case design ratio for flexure/compression Capacity 
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the 
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y), 
while
       the results for shear are reported as being for shear forces �along� 
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear 
along
       the X axis.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 W LTB Test F.1-2B

Verify the available lateral-torsional buckling capacity of a wide-flange section which is braced at third points with major axis bending per the AISC 360-16 code.

Details

Verify the bending capacity of a W18x50. The member is used as a 35 ft simple span subject to uniform loads. The member is braced at ends and at third points. The material is ASTM A992 ($F_y = 50\ ksi$).

Validation

<u>Nonuniform Moment Modification</u>

From Table 3-1 of Reference 1:

$C_b = 1.01$ for center segment
$C_b = 1.45$ for end segments

By inspection, the center segment will govern.

$L_b = 35 / 5 = 11.7$ ft

The limiting lengths for lateral-torsional buckling are:

$$L_p = 1.75 r_y \sqrt{\frac{E}{F_y}} = 1.75(1.65)\sqrt{\frac{29,000}{50}} = 69.9\text{in} = 5.83\text{ft} \quad \text{[Eqn. F2-5]}$$

$$L_r = 1.95 r_{ts} \frac{E}{0.7F_y}\sqrt{\frac{Jc}{S_x h_o} + \sqrt{\left(\frac{Jc}{S_x h_o}\right)^2 + 6.76\left(\frac{E}{0.7F_y}\right)^2}} \quad \text{[Eqn. F2-6]}$$

where

c = 1 for a doubly symmetric I-shape (Eqn. F2-8a)

$$L_r = 1.95(1.98)\frac{29,000}{0.7(50)}\sqrt{\frac{1.24(1.0)}{88.9(17.4)} + \sqrt{\left(\frac{1.24(1.0)}{88.9(17.4)}\right)^2 + 6.76\left(\frac{29,000}{0.7(50)}\right)^2}} = 203\text{in} = 16.9\text{ft}$$

$M_p = F_y Z_x = 50 \times 101 = 5{,}050$ in·k

$$M_n = C_b\left[M_p - \left(M_p - 0.7F_y S_x\right)\left(\frac{L_b - L_p}{L_r - L_p}\right)\right] \le M_p \quad \text{[Eqn. F3-1]}$$

$$M_n = 1.01\left\{5,050 - \left[5,050 - 0.7(50)(88.9)\right]\left(\frac{11.7 - 5.83}{16.9 - 5.83}\right)\right\} = 4,062\ \text{in}\cdot\text{k} = 338.5\ \text{ft}\cdot\text{k}$$

LRFD

$\phi_b M_n = 304.7$ ft·k

ASD

$M_n/\Omega_b = 202.7$ ft·k

Results

Table 726: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k)	304.7	305.5	negligible	
M_n / Ω_b (ft·k)	202.7	203.3	negligible

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 ======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
```

```
along
       the X axis.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 W Member Selection F.4

Verify the selection of an optimized wide flange section for major axis bending per the AISC 360-16 code.

Details

Select a wide flange section based on moment of inertia required to limit deflection. The member is used as a 30 ft simple span which caries a uniform dead load of 0.8 kip/ft and a uniform live load of 2 kip/ft. The member is continuously braced. The material is ASTM A992 ($F_y = 50\ ksi$).

Validation

Ultimate load (for LRFD):

$$w_u = 1.2(0.8) + 1.6(2.0) = 4.16 \text{ kip/ft}$$

$$M_u = w_u L^2/8 = (4.16)(30)^2/8 = 468 \text{ kip}\cdot\text{ft}$$

Service level load (for ASD):

$$w_a = 0.8 + 2.0 = 2.8 \text{ kip/ft}$$

$$M_a = w_a L^2/8 = (2.8)(30)^2/8 = 315 \text{ kip}\cdot\text{ft}$$

Minimum Moment of Inertia

Assume a live load deflection limit of $L/360 = 30\times12/360 = 1.0\ in$

$$\Delta_{max} = \frac{5 w_L L^4}{384 EI}$$

$$I_{min} = \frac{5 w_L L^4}{384 E \Delta_{max}} = \frac{5(2.0)(30)^4(12)^3}{384(29,000)(1.0)} = 1,260 \text{ in}^4$$

Try a W24x55 ($I_x = 1,350\ in^4$)

The W24x55 is a compact section and the member is continuously braced.

$$M_n = M_p = F_y Z_x = 50\times134 = 6,700 \text{ in}\cdot\text{k}$$

LRFD

$$\phi_b M_n = 502.5 \text{ ft}\cdot\text{k} > 468 \text{ ft}\cdot\text{k (OK)}$$

ASD

$$M_n/\Omega_b = 334.3 \text{ ft}\cdot\text{k} > 315 \text{ ft}\cdot\text{k (OK)}$$

Results

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 ========================
```

```
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ALL UNITS ARE - KIP  FEET (UNLESS OTHERWISE Noted).
 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 ======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
```

```
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ALL UNITS ARE - KIP  FEET (UNLESS OTHERWISE Noted).
 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 WT Shape F.10

Verify the available flexural strength of a WT (“split tee”) member per the AISC 60-16 code.

Details

Verify the bending capacity of a WT5x6. The member is used as a 6.0 ft simple span. The member is continuously braced. The material is ASTM A992 ($F_y = 50\ ksi$).

Validation

The member is continuously braced, so lateral-torsional buckling does not control.

Yielding

$$M_n = F_y Z_x \leq 1.6 M_y \qquad \text{[Eqn. F9-2]}$$

where

$$M_y = F_y S_x = 50 \times 1.22 = 61\ in \cdot k$$

$$M_n = 50 \times 2.20 = 110\ in \cdot k > 1.6(61.0) = 97.6\ in \cdot k$$

Flange Local Buckling

$\lambda = b/2t_f = 9.43$ (from Table 1-8 of Reference 1)

$$\lambda_p = 0.38\sqrt{\frac{E}{F_y}} = 0.38\sqrt{\frac{29{,}000}{50}} = 9.15$$

$$\lambda_p = 1.0\sqrt{\frac{E}{F_y}} = 1.0\sqrt{\frac{29{,}000}{50}} = 24.1$$

$\lambda_p < \lambda < \lambda_r$, therefore, the flange is non-compact.

For non-compact sections:

$$M_n = M_p - \left(M_p - 0.7F_yS_x\right)\left(\frac{\lambda - \lambda_p}{\lambda_r - \lambda_p}\right) \leq 1.6M_y \quad \text{[Eqn. F9-14]}$$

$$M_n = 110 - \left[110 - 0.7(50)(3.20)\right]\left(\frac{9.43 - 9.15}{24.1 - 9.15}\right) = 110 \text{ in}\cdot\text{k} > 96.7 \text{ in}\cdot\text{k}$$

$$M_n = 97.6 \text{ in}\cdot\text{k} = 8.13 \text{ ft}\cdot\text{k}$$

LRFD

$$\phi_b M_n = 7.32 \text{ ft}\cdot\text{k}$$

ASD

$$M_n/\Omega_b = 4.87 \text{ ft}\cdot\text{k}$$

Results

Table 728: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k)	7.32	7.21	1.5%	
M_n/Ω_b (ft·k)	4.87	4.797	1.5%

                     ****************************************************
 ALL UNITS ARE - KIP  FEET (UNLESS OTHERWISE Noted).
 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 Built Up Column E.2

Verify the available compressive strength of a built-up column with a slender web per the AISC 360-16 code.

References

1. *Steel Construction Manual*, 15th Edition, American Institute of Steel Construction, 2017
2. *Design Examples*, Version 15.0, American Institute of Steel Construction, 2017, pp.E-14 – E-18., Example E.2

Details

From reference 2:

> Verify that a built-up, ASTM A572 Grade 50 column with PL1 in.×8 in. flanges and a PL4 in.×15 in. web… is sufficient to carry a dead load of 70 kips and live load of 210 kips in axial compression. The column's unbraced length is 15 ft and the ends are pinned in both axes.

ASTM A572 Grade 50: $F_y = 50\ ksi$

Validation

Refer to reference.

Results

Table 729: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips)	500	497.9	negligible	
P_n / Ω_c (kips)	332	331.3	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 Built Up Column E.STD` is typically installed with the program.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 Double L E.5

Verify the available compressive strength of a double angle compression member without slender elements per the AISC 360-16 code.

Details

From reference 2:

Verify the strength of a 2L4×3-1/2×3/8 LLBB (3/4-in. separation) strut, ASTM A36, with a length of 8 ft and pinned ends carrying an axial dead load of 20 kips and live load of 60 kips. Also, calculate the required number of pretensioned bolted or welded intermediate connectors required.

ASTM A536: $F_y = 36\ ksi$

Validation

Refer to reference.

Results

Table 730: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips)	128	127.2	negligible	
P_n / Ω_c (kips)	85	84.62	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 Double L E.STD` is typically installed with the program.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
```

```
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
```

```
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V. AISC 360-16 I Compression LRFD

Verify the flexural buckling capacity of an I section under compressive load using the LRFD method per the ASIC 360-16 code.

References

Details

Verify the Flexural Buckling strength of an I Section (W14x90) using the LRFD method

Steel Gr. ASTM A992, about X and Y axis with a member length of 30 ft with dead load 140 kips and Live Load 420 kips.

Validation

Strong axis unbraced length, $L_x = 360\ in$

Torsional axis unbraced length $L_y = 180\ in$

Ultimate load, $P_u = 1.2(180\ kips) + 1.6(420\ kips) = 840\ kips$

Calculation for major axis (X axis)

From Table C-A-7.1 of ref. 1, $K = 1.0$ for a pinned-pinned condition.

$\frac{b_f}{2t_f} = 10.211 < 0.56\sqrt{\frac{E}{F_y}} = 13.487$, thus the flange is non-slender.

Slenderness ratio about X axis $= \frac{KL_x}{r_x} = 58.632 < 4.71\sqrt{\frac{E}{F_y}} = 113.432$

Calculate the elastic critical buckling stress: $F_{eX} = \frac{\pi^2 E}{(KL_x / r_x)^2} = 83.259ksi$

Calculate the flexural buckling stress: $F_{crX} = 0.658^{F_y/F_{eX}} F_y = 38.887ksi$

Compressive strength for flexural buckling along X: $\phi_c P_{nFBX} = \phi_c F_{crX} A_g = 947.462kips$

Ratio for flexural buckling strength = 0.906

Calculation for minor axis (Y axis)

$$h = d - 2 \cdot t_f = 12.58\ in$$

$\frac{h}{t_w} = 28.591 < 35.884$, thus the flange is non-slender.

Slenderness ratio about Y axis $= \frac{KL_y}{r_y} = 48.703 < 4.71\sqrt{\frac{E}{F_y}} = 113.432$

Calculate the elastic critical buckling stress: $F_{eY} = \frac{\pi^2 E}{(KL_y / r_y)^2} = 120.668ksi$

Calculate the flexural buckling stress: $F_{crY} = 0.658^{F_y/F_{eY}} F_y = 42.039ksi$

Compressive strength for flexural buckling along Y: $\phi_c P_{nFBY} = \phi_c F_{crY} A_g = 1,\ 002.625kips$

Ratio for flexural buckling strength = 0.838

Results

Table 731: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Flexural Buckling Capacity, X Axis (kips)	927.5	927.5	none	
Ratio	0.906	0.906	none	
Flexural Buckling Capacity, Y Axis (kips)	1,003	1,003	none	
Ratio	0.838	0.838	none

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
```

```
       Mx              MZ          Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 Pipe E.11

Verify the available compressive strength of a pipe section per the AISC 360-16 code.

Details

From reference 2:

Select an ASTM A53 Grade B Pipe compression member with a length of 30 ft to support a dead load of 35 kips and live load of 105 kips in axial compression. The column is pin-connected at the ends in both axes and braced at the midpoint in the y-y direction.

ASTM A572 Grade 50: $F_y = 35\ ksi$

Validation

Refer to reference.

Results

Table 732: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips)	221	218.6	1.1%	
P_n / Ω_c (kips)	147	145.4	1.1%	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 Pipe E.STD` is typically installed with the program.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
```

```
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
```

```
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 Rect HSS E.9

Verify the available compressive strength of a rectangular HSS member per the AISC 360-16 code.

Details

From reference 2:

Select an ASTM A500 Grade C rectangular HSS compression member, with a length of 20 ft, to support a dead load of 85 kips and live load of 255 kips in axial compression. The base is fixed and the top is pinned.

ASTM A500 Grade C: $F_y = 50\ ksi$

Validation

Refer to reference.

Results

Table 733: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips)	556	555.3	negligible	
P_n / Ω_c (kips)	370	369.5	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 Rect HSS E.STD` is typically installed with the program.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

                       STAAD.PRO CODE CHECKING - AISC 360-16 ASD (V1.2)
                     ****************************************************
 ALL UNITS ARE - KIP  INCH (UNLESS OTHERWISE Noted).
 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.
 *** ABBREVIATIONS ***:

Details

The section checked is a W14x120. From reference 2:

> The column is pinned top and bottom in both axes. Limit the column size to a nominal 14-in. shape. The column is verified for ... ASTM A913 Grade 65 material.

ASTM A572 Grade 65: $F_y = 65\ ksi$

Validation

Refer to reference.

Results

Table 734: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips)	865	857.8	negligible	
P_n / Ω_c (kips)	569	570.8	negligible

                       STAAD.PRO CODE CHECKING - AISC 360-16 LRFD (V1.2)
                     *****************************************************
 ALL UNITS ARE - KIP  FEET (UNLESS OTHERWISE Noted).
 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
```

```
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

Details

From reference 2:

> Verify a W14x90 is adequate to carry the loading... The column is pinned top and bottom in both axes and braced at the midpoint about the y-y axis and torsionally. The column is verified for ... ASTM A913 Grade 65 material.

ASTM A572 Grade 65: $F_y = 65\ ksi$

Validation

Refer to reference.

Results

Table 735: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips)	1,080	1,080	none	
P_n / Ω_c (kips)	719	718.4	negligible

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
```

```
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V. AISC 360-16 Shear Strong Axis

Verify the shear strength of an I section loaded in the strong axis using the LRFD and ASD methods per AISC 360-16.

Details

From the reference:

> determine the available shear strength and adequacy of an ASTM A992 W24X62 with end shears of 48 kips from dead load and 145 kips from live load.

The shear capacity values are evaluated from AISC Manual Table 2-4 and the also calculated.

Validation

Area of the web used for shear is:

$$A_w = dt_w = 23.7 \times 0.430 = 10.2 \text{ in}^2$$

The nominal shear strength is:

$$V_n = 0.6F_yA_wC_{v1} = 0.6\,(50)(10.2)(1.0) = 306 \text{ kips}$$

LRFD

The shear strength is:

$$\phi_vV_n = 1.00(306) = 306 \text{ kips}$$

The ultimate shear demand is:

$$Vu = 1.2\,(48) + 1.6\,(145) = 289.6 \text{ kips}$$

ASD

The allowable shear is:

$$V_n/\Omega_v = 306 / 1.5 = 204 \text{ kips}$$

The shear demand is:

$$V_a = 48 + 145 = 193 \text{ kips}$$

Results

Table 736: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Shear capacity, $\phi_v V_n$, Y axis (kips) LRFD	306	305.7	negligible	
Shear demand, V_u, Y axis (kips) LRFD	289.6	289.6	none	The reference rounds this value to 290 kips.
Shear capacity, V_n/Ω_vm, Y axis (kips) ASD	204	203.8	negligible	
Shear demand, V_a, Y axis (kips) ASD	193	193.0	none	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 Shear Strong Axis.STD` is typically installed with the program.

 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
```

```
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC 
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections 
principal major axis.
       Y               Y          Axis typically parallel to the sections 
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the 
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase 
that
       produced the worst case design ratio for flexure/compression Capacity 
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the 
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y), 
while
       the results for shear are reported as being for shear forces �along� 
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear 
along
       the X axis.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
```

```
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V. AISC 360-16 Shear Weak Axis

Verify the shear strength of an I section loaded in the weak axis using the LRFD and ASD methods per AISC 360-16.

References

1. *Steel Construction Manual*, 15th Edition, American Institute of Steel Construction, 2017
2. *Design Examples*, Version 15.0, American Institute of Steel Construction, 2017, pp G-14 - G-15, Example G.1B

Related Links

- *D1.A.5.4 Design for Shear* (on page 1094)

Details

From the reference:

Verify the available shear strength and adequacy of an ASTM A992 W21X48 beam with end shears of 20.0 kips from dead load and 60.0 kips from live load in the weak direction.

Validation

$C_{v2} = 1.0$ for all ASTM A6 W shapes with Fy ≤ 70 ksi, per the User Note in section G6 of the AISC 360-16 specification.

The nominal shear strength is:

$$V_n = 2\times[0.6F_y b_f t_f C_{v2}] = 2\times[0.6\ (50)(8.14)(0.43)(1.0)] = 210.0 \text{ kips}$$

<u>LRFD</u>

The shear strength is:

$$\phi_v V_n = 0.90(210.0) = 189.0 \text{ kips}$$

The ultimate shear demand is:

$$Vu = 1.2\ (20) + 1.6\ (60) = 120 \text{ kips}$$

<u>ASD</u>

The allowable shear is:

$$V_n/\Omega_v = 306\ /\ 1.67 = 125.8 \text{ kips}$$

The shear demand is:

$$V_a = 20 + 60 = 80 \text{ kips}$$

Results

Table 737: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Shear capacity, $\phi_v V_n$, X axis (kips) LRFD	189	189.0	none	
Shear demand, V_u, X axis (kips) LRFD	120	120.0	none	
Shear capacity, V_n/Ω_vm, X axis (kips) ASD	125.8	125.8	none	The reference rounds this value to 126 kips.
Shear demand, V_a, X axis (kips) ASD	80	80.0	none	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 Shear Weak Axis.STD` is typically installed with the program.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
```

```
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

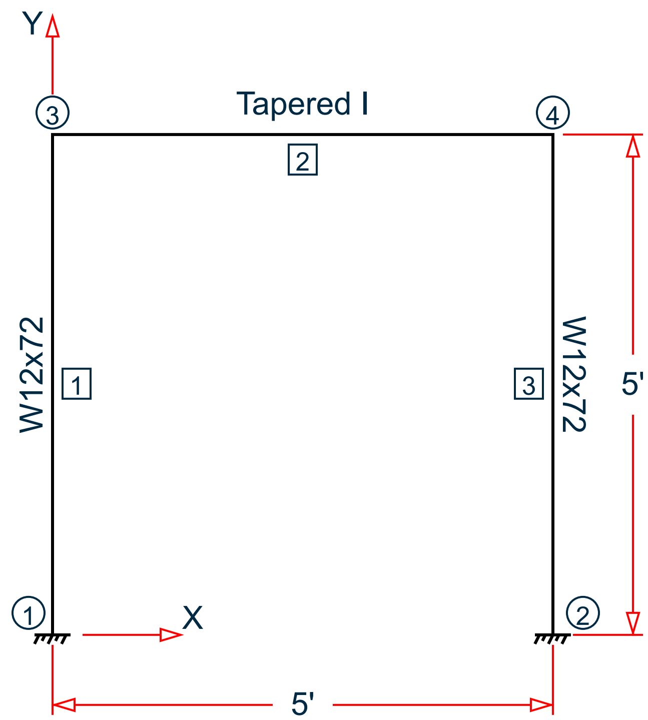
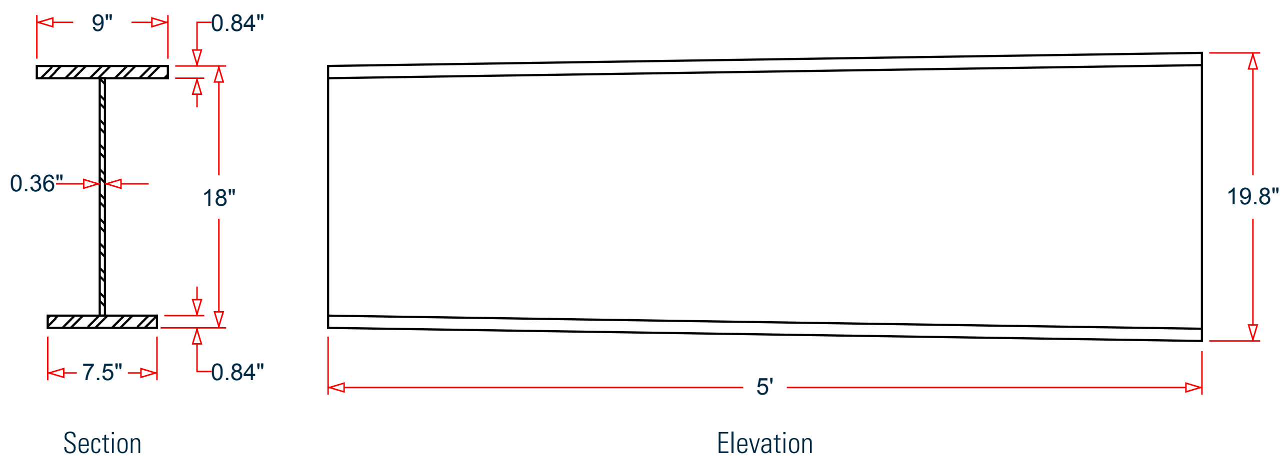
V. AISC 360-16 Tapered I Section

Verify the axial compression capacity, flexure capacity, and interaction ratio of a tapered I section member per both the LRFD and ASD methods of the AISC 360-16 code.

Details

A 5' × 5' portal frame consists of W12x72 columns and a steel tapered member for the beam.





The following load cases are evaluated:

1. A uniformly distributed load of -3.5 k/ft along the beam in the global Y direction.
2. Lateral loads at the top of the left column of 50 kips in the global X direction and 25 kips in the global Z direction (out of plane).
3. Lateral loads at the top of the right column of -50 kips in the global X direction and 45 kips in the global Z direction (out of plane).
4. A concreted load of -100 kips in the global Y direction and a concentrated torque of 9 in·kips at mid-span of the beam.

Material Properties

E = 29,000 ksi
Fy = 50 ksi

Validation

Design Forces

By inspection, the left end of the beam (shallowest overall depth) governs under the symmetric loads present. The following design loads are used from the STAAD.Pro analysis are then used:

1. M_z = 32.26 in·kips, F_y = 8.755 kips
2. M_z = 677.6 in·kips, M_y = 2.942 in·kips, M_x = 5.106 in·kips, F_y = 22.49 kips, F_z = 0.098 kips, F_x = 24.70 kips
3. M_z = 275.9 in·kips, M_x = 4.497 in·kips, F_y = 50.23 kips, F_x = 5.473 kips
4. M_z = 654.5 in·kips, M_y = 5.298 in·kips, M_x = 9.192 in·kips, F_y = 22.50 kips, F_z = 0.177 kips, F_x = 24.35 kips

Section Properties

The section at the left end ($D = 18\ in.$) has the following properties:

Web height, $d_w = 18 - 2 \times 0.84 = 16.32\ in.$
Area, $A_g = (0.84)(9 + 7.5) + 16.32\ (0.36) = 19.74\ in^2$
Shear area in local y, $A_y = 16.32(0.36) = 5.875\ in^2$
Shear area in local x, $A_x = 0.84(9 + 7.5) = 13.86\ in^2$

Dist to centroid y, $c = \dfrac{7.5\left(0.84\right)\left(\frac{0.84}{2}\right) + 0.36\left(16.32\right)\left(0.84 + \frac{16.32}{2}\right) + 9\left(0.84\right)\left(18 - \frac{0.84}{2}\right)}{19.74} = 9.548\ in.$

Moment of inertia about major axis,

$$I_{zz} = \frac{7.5(0.84)^3}{12} + 7.5(0.84)\left(9.548 - \frac{0.84}{2}\right)^2 + \frac{0.36(16.32)^3}{12} + 0.36(16.32)\left(9.548 - \frac{16.32}{2} - 0.84\right)^2 + \frac{9(0.84)^3}{12} + 9(0.84)\left(18 - \frac{0.84}{2} - 9.548\right)^2 = 1,\ 147\ \text{in}^4$$

Moment of inertia about minor axis,

$$I_{yy} = \frac{0.84(9)^3}{12} + \frac{16.32(0.36)^3}{12} + \frac{0.84(7.5)^3}{12} = 80.62\ \text{in}^4$$

Elastic section modulus about major axis top flange fiber, $S_{xx,top} = \dfrac{I_{zz}}{D - c} = \dfrac{1,\ 146}{18 - 9.548} = 135.5\ in^3$

Elastic section modulus about major axis bottom flange fiber, $S_{xx,bottom} = \dfrac{I_{zz}}{c} = \dfrac{1,\ 146}{9.548} = 120.0\ in^3$

Elastic section modulus about minor axis, $S_{yy} = \dfrac{I_{yy}}{b_{f1}\ /\ 2} = \dfrac{80.62}{9\ /\ 2} = 17.92\ in^3$

Radius of gyration about major axis, $r_x = \sqrt{\dfrac{I_{zz}}{A_g}} = \sqrt{\dfrac{1,\ 147}{19.74}} = 7.619\ in$

Radius of gyration about minor axis, $r_y = \sqrt{\dfrac{I_{yy}}{A_g}} = \sqrt{\dfrac{80.62}{19.74}} = 2.021\ in$

Location of the plastic neutral axis, $y_{PNA} = 0.84 + \frac{19.74 - 2(7.5)(0.84)}{2 \times 0.36} = 10.75\ in.$

Plastic section modulus about major axis,

$$Z_{zt} = \frac{7.5(10.75)^2}{2} - \frac{(7.5 - 0.36)(10.75 - 0.84)^2}{2} + \frac{9(18 - 10.75)^2}{2} - \frac{(9 - 0.36)(18 - 0.84 - 10.75)^2}{2} = 141.8\ \text{in}^3$$

Plastic section modulus about minor axis, $Z_y = \frac{0.84(9)^2}{4} + \frac{16.32(0.36)^2}{4} + \frac{0.84(7.5)^2}{4} = 29.35\ in^3$

Torsional constant, $J = \frac{9(0.84)^3 + 16.32(0.36)^3 + 7.5(0.84)^3}{3} = 3.514\ in.^4$

<u>Section Classification</u>

Flange in compression

$$\lambda = \frac{b}{t} = \frac{1/2 \times 7.5}{0.84} = 4.464$$

$$k_c = \frac{4}{\sqrt{d_w / t_w}} = \frac{4}{\sqrt{\frac{16.32}{0.36}}} = 0.594$$

Per Table B4.1a, $\lambda < \lambda_r = 0.64\sqrt{\frac{k_c E}{F_y}} = 0.64\sqrt{\frac{0.594(29,000)}{50}} = 11.88$, therefore flanges are non-slender for compression.

Web in compression

$$\lambda = \frac{d_w}{t_w} = \frac{16.32}{0.36} = 45.33$$

Per Table B4.1a, Case 5, $\lambda > \lambda_r = 1.49\sqrt{\frac{E}{F_y}} = 1.49\sqrt{\frac{29,000}{50}} = 35.88$, therefore the web is slender for compression.

Flange in bending (use half the longer flange width as the outstanding width):

$$\lambda = \frac{b_f}{t_f} = \frac{9}{2(0.84)} = 5.36$$

Per Table 1.b, Case 11, $\lambda < \lambda_p = 0.38\sqrt{\frac{E}{F_y}} = 0.38\sqrt{\frac{29,000}{50}} = 9.15$, therefore flange is compact for bending.

Web in bending

$$\lambda = \frac{d_w}{t_w} = \frac{16.32}{0.36} = 45.33$$

Per Table 1.b, Case 15, $\lambda < \lambda_p = 3.76\sqrt{\frac{E}{F_y}} = 3.76\sqrt{\frac{29,000}{50}} = 90.55$, therefore web is compact for bending.

<u>Compression Capacity</u>

About X Axis:

$$\frac{k_x L_x}{r_x} = \frac{1.0(60)}{7.619} = 7.875 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,000}{50}} = 113.4$$

$$F_{ex} = \frac{\pi^2 E}{\left(\frac{k_x L_x}{r_x}\right)^2} = \frac{\pi^2 \times 29,000}{(7.875)^2} = 4{,}615 \text{ ksi} \qquad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_{ex}} = \frac{50}{4{,}615} = 0.011 < 2.25$$

$$F_{crx} = 0.658^{F_y/F_{ex}} F_y = 0.658^{(0.011)} 50 = 49.77 \text{ ksi} \qquad \text{(Eq. E3-2)}$$

Since the web is slender, use the effective area. The effective width imperfection adjustment factors (Table E7.1):

$c_1 = 0.18$

$c_2 = 1.31$

$$F_{el} = \left(c_2 \frac{\lambda_r}{\lambda}\right)^2 F_y = \left(1.31 \frac{35.88}{45.33}\right)^2 = 53.76 \text{ ksi} \qquad \text{(Eq. E7-5)}$$

Therefore, the effective depth of the web in compression for the effective area:

$$d_e = d_w \left(1 - c_1 \sqrt{\frac{F_{el}}{F_{crx}}}\right)\sqrt{\frac{F_{el}}{F_{crx}}} = 16.32\left(1 - 0.18\sqrt{\frac{53.76}{49.77}}\right)\sqrt{\frac{53.76}{49.77}} = 13.78 \text{ in.} \qquad \text{(Eq. E7-3)}$$

The reduced area of the section then becomes:

$$A_e = 19.75 - (16.32 - 13.78)0.36 = 18.84 \text{ in.}^2$$

$$P_{nx} = A_e \times F_{crx} = 18.84 \times 49.77 = 937.4 \text{ kips} \qquad \text{(Eq. E7-1)}$$

About Y Axis:

$$\frac{k_y L_y}{r_y} = \frac{1.0(60)}{2.021} = 29.69 < 4.71\sqrt{\frac{E}{F_y}} = 113.4$$

$$F_{ey} = \frac{\pi^2 E}{\left(\frac{k_y L_y}{r_y}\right)^2} = \frac{\pi^2 \times 29,000}{(29.69)^2} = 324.7 \text{ ksi} \qquad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_{ey}} = \frac{50}{324.7} = 0.154 < 2.25$$

$$F_{cry} = 0.658^{(F_y/F_{ey})} F_y = 0.658^{(0.154)} 50 = 46.88 \text{ ksi} \qquad \text{(Eq. E3-2)}$$

Therefore, the effective depth of the web in compression for the effective area:

$$d_e = d_w \left(1 - c_1 \sqrt{\frac{F_{el}}{F_{cry}}}\right)\sqrt{\frac{F_{el}}{F_{cry}}} = 16.32\left(1 - 0.18\sqrt{\frac{53.76}{46.88}}\right)\sqrt{\frac{53.76}{46.88}} = 14.11 \text{ in.} \qquad \text{(Eq. E7-3)}$$

The reduced area of the section then becomes:

$$A_e = 19.75 - (16.32 - 14.11)0.36 = 18.93 \text{ in.}^2$$

$$P_{ny} = A_e \times F_{cry} = 18.93 \times 46.88 = 887.4 \text{ kips} \quad \text{(Eq. E7-1)}$$

The Y axis governs; $P_n = P_{ny}$. The axial capacity:

The ultimate compression capacity (LRFD) = $\phi_c P_n = 0.9 \times 887.4 = 798.3\ kips$
The allowable compression capacity (ASD) = $P_n / \Omega_c = 887.4\ /\ 1.67 = 531.4\ kips$

<u>Calculate Bending Capacity</u>

Bending capacity in plastic yielding about Y axis:

$$M_y = F_y \times Z_y = 50 \times 29.35 = 1{,}468 \text{ in·kips} > 1.6F_y \times S_y = 1.6\ (50)\ (17.92) = 1{,}434 \text{ in·kips}$$

Use $M_y = 1{,}434\ in \cdot kips$

The bending capacity for flexural yielding about the Y axis:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 1{,}434 = 1{,}290\ in \cdot kips$
The allowable bending capacity (ASD) = $M_y / \Omega_b = 1{,}434\ /\ 1.67 = 858.4\ in \cdot kips$

Bending capacity in plastic yielding about X axis:

Note: In the critical load case (LC4), the bending at the left end is *reverse* (i.e., “hogging”). Thus, the bottom flange is in compression; which has a lower elastic section modulus.

Calculate the bending strength reduction factor:

$$R_{pg} = 1 - \frac{a_w}{1,\ 200 + 300a_w}\left(\frac{h_c}{t_w} - 5.7\sqrt{\frac{E}{F_y}}\right) \le 1.0 \quad \text{(Eq. F5.6)}$$

where

h_c = Two times the distance from the center of gravity to the inside face of the compression flange. $2 \times (9.548 - 0.84) = 17.42\ in.$

a_w = $\frac{h_c t_w}{b_{fc} t_{fc}} = \frac{17.42 \times 0.36}{7.5 \times 0.84} = 0.995$

$$R_{pg} = 1 - \frac{0.995}{1,\ 200 + 300(0.995)}\left(\frac{17.42}{0.36} - 5.7\sqrt{\frac{29,\ 000}{50}}\right) = 1.01;\ \text{use } = 1.0$$

$$M_n = R_{pg} \times F_y \times S_{yc} = 1.0 \times 50 \times 120 = 6{,}000 \text{ in·kips}$$

The bending capacity for flexural yielding about the X axis:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 6{,}000 = 5{,}400\ in \cdot kips$
The allowable bending capacity (ASD) = $M_y / \Omega_b = 5{,}000\ /\ 1.67 = 3{,}593\ in \cdot kips$

Lateral-torsional buckling about the X axis:

$$L_p = 1.1 r_t \sqrt{\frac{E}{F_y}} \quad \text{(Eq. F4-7)}$$

where

r_t = the effective radius of gyration for lateral-torsional buckling. For I-shapes with rectangular compression flanges:

$$= \frac{b_{fc}}{\sqrt{12\left(1 + \frac{1}{6}a_w\right)}}$$

Thus, $r_t = \frac{7.5}{\sqrt{12\left(1 + \frac{1}{6}0.995\right)}} = 2.005$ and $L_p = 1.1\left(2.005\right)\sqrt{\frac{29,000}{50}} = 53.12\ in.$. Therefore, lateral-torsional buckling must be checked.

$$L_r = 1.95 r_t \frac{E}{F_L}\sqrt{\frac{J}{S_{xc}h_o} + \sqrt{\left(\frac{J}{S_{xc}h_o}\right)^2 + 6.76\left(\frac{F_L}{E}\right)}} \qquad \text{(Eq. F4-8)}$$

where

F_L = $0.7F_y = 0.7\ (50) = 35\ ksi$ for $\frac{S_{xt}}{S_{xc}} = \frac{135.5}{120.0} = 1.13 > 0.7$

h_o = distance between flange centroids = $18 - 0.84 = 17.16\ in.$

$$L_r = 1.95(2.005)\frac{29,000}{35}\sqrt{\frac{3.514}{120 \times 17.16} + \sqrt{\left(\frac{3.514}{120 \times 17.16}\right)^2 + 6.76\left(\frac{35}{29,000}\right)^2}} = 235.4\text{ in.}$$

As $L_r < L_b = 60 < L_p$, the nominal moment capacity is:

$$M_n = C_b\left[R_{pc}M_{yc} - \left(R_{pc}M_{yc} - F_L\ S_{xc}\right)\left(\frac{L_b - L_p}{L_r - L_p}\right)\right] \le R_{pc}M_{yc} \qquad \text{(Eq. F4-2)}$$

where

C_b = 1.0
M_{yc} = $F_yS_{yc} = 50 \times 120 = 6,000\ ksi$
M_p = $F_yZ_x = 50 \times 141.8 = 7,090\ ksi \le 1.6\ F_yS_x = 9,600\ ksi$

$$M_n = 1.0\left\{1.182(6,000) - [1.182(6,000) - 35(120)]\left(\frac{60 - 53.12}{235.4 - 53.12}\right)\right\} = 6,983\text{ ksi}$$

The bending capacity for lateral-torsional buckling:

The ultimate bending capacity (LRFD) = $\phi_bM_y = 0.9 \times 6,983 = 6,285\ in \cdot kips$
The allowable bending capacity (ASD) = $M_y/\Omega_b = 6,983\ /\ 1.67 = 4,181\ in \cdot kips$

<u>Compression Flange Yielding</u>

$$M_n = R_{pc} \times M_{yc} \qquad \text{(Eq. F4-1)}$$

where

I_{yc} = moment of inertia of the compression flange about the Y axis $= \frac{0.84(7.5)^3}{12} = 29.53\ in.^4$

M_{yc} = $M_y \times S_{xc} = M_y \times S_{xx,top} = 50 \times 135.5 = 6,775\ in \cdot kips$

R_{pc} = the web plastification factor, $= \frac{M_p}{M_{yc}} = \frac{7,090}{6,775} = 1.046$ when $I_{yc}\ /\ I_y = {}^{29.53}\!/_{80.62} = 0.366 > 0.23$ and $\frac{h_c}{t_w} = \frac{17.42}{0.36} = 48.38 < \lambda_{pw} = 90.55$ (limiting slenderness for a compact web per Table 1b case 15)(Eq. F4-9a)

$$M_n = 1.046 \times 6,775 = 7,087\text{ in} \cdot \text{kips}$$

The bending capacity for compression flange yielding:

The ultimate bending capacity (LRFD) = $\phi_bM_n = 0.9 \times 7,087 = 6,378\ in \cdot kips$
The allowable bending capacity (ASD) = $M_n/\Omega_b = 7,087\ /\ 1.67 = 4,244\ in \cdot kips$

Interaction Ratio for Bending and Compression

Check the interaction ratio for Load Case 2:

$$\frac{P_r}{P_c} = \frac{24.7}{798.3} = 0.031 < 0.2 \text{ (LRFD)}$$

$$\frac{P_r}{P_c} = \frac{24.7}{531.4} = 0.046 < 0.2 \text{ (ASD)}$$

So use Eq. H1-1b for both methods: $\frac{P_r}{2P_c} + \left(\frac{M_{rx}}{M_{cx}} + \frac{M_{ry}}{M_{cy}}\right) \leq 1.0.$

$$\frac{0.031}{2} + \left(\frac{677.6}{6{,}378} + \frac{2.942}{1,\ 321}\right) = 0.124 \text{ (LRFD)}$$

$$\frac{0.046}{2} + \left(\frac{677.6}{4{,}244} + \frac{2.942}{878.7}\right) = 0.188 \text{ (ASD)}$$

Results

Table 738:

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Compression capacity (kips)	798.3	798.8	negligible	
	Major axis bending capacity (in·kips)	6,378	6,380	negligible	
	Minor axis bending capacity (in·kips)	1,290	1,290	none	
	Interaction ratio	0.124	0.124	none	
ASD	Compression capacity (kips)	531.4	531.48	negligible	
	Major axis bending capacity (in·kips)	4,244	4,245	negligible	
	Minor axis bending capacity (in·kips)	858.4	858.28	negligible	
	Interaction ratio	0.188	0.186	negligible	

The following D1.A.6 Design Parameters (on page 1100) are used:

- The welded tapered member is specified using `STP 2`

The remaining parameters all use their default values.

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 Tapered I Section.STD` is typically installed with the program.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
```

```
      Vy              FY          Shear force along minor axis.
      Vx              FZ          Shear force along major axis.
      Tz              MX          Torsional moment.
      My              MY          Bending moment about minor axis.
      Mx              MZ          Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------

       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

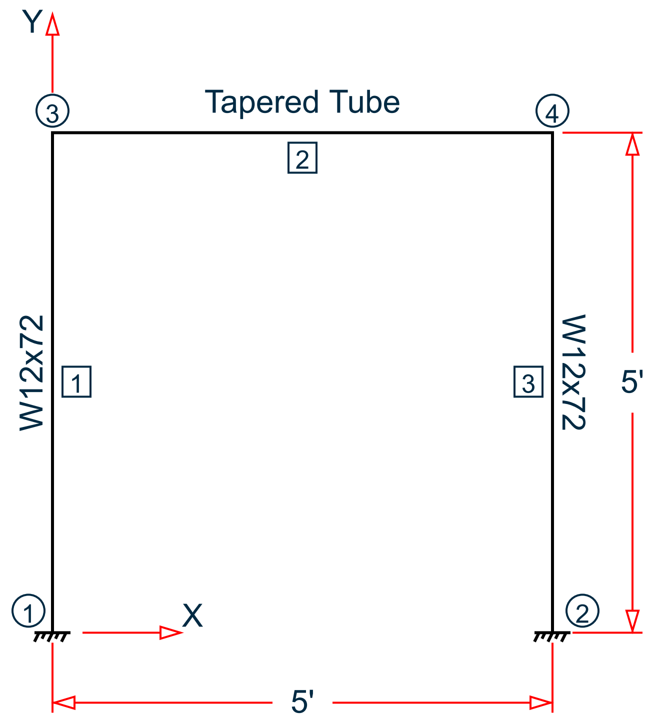
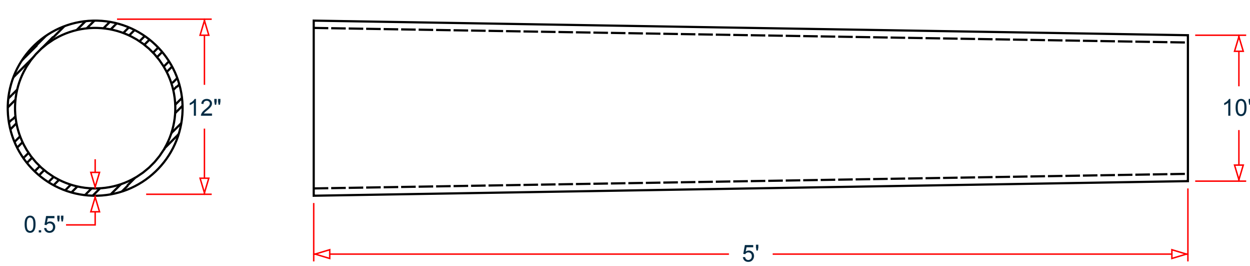
V. AISC 360-16 Tapered Tube Section

Verify the axial compression capacity, flexure capacity, and interaction ratio of a tapered tube section member per both the LRFD and ASD methods of the AISC 360-16 code.

Details

A 5' × 5' portal frame consists of W12x72 columns and a steel tapered member for the beam.





Section

Elevation

The following load cases are evaluated:

1. A uniformly distributed load of -2.25 k/in along the beam in the global Y direction.
2. Lateral loads at the top of the left column of 50 kips in the global X direction and 25 kips in the global Z direction (out of plane).
3. A concreted torque of 0.75 in·kips at mid-span of the beam.

Material Properties

E = 29,000 ksi
Fy = 50 ksi

Validation

Design Forces

By inspection, the right end of the beam (shallowest overall depth) governs under the symmetric loads present. The following design loads are used from the STAAD.Pro analysis are then used:

$M_z = 505.66\ in \cdot kips$
$F_y = 67.2\ kips$
$F_x = 10.23\ kips$

Section Properties

The section at the right end ($OD = 10\ in.$) has the following properties:

Inner diameter, ID = 9 in.
Area, $A_g = (\pi/4)(OD^2 - ID^2) = 14.92\ in^2$
Form factor = $0.49 + 0.8\ (t\ /\ OD) = 0.53$
Shear area, $A_y = 14.92(0.53) = 7.909\ in^2$
Moment of inertia,

$$I = \frac{\pi}{64}\left(\mathrm{OD}^4\text{-}\mathrm{ID}^4\right) = 168.8\ \mathrm{in}^4$$

Elastic section modulus, $S = \frac{\pi}{32}\left(\frac{OD^4\text{-}ID^4}{OD}\right) = 33.76\ in^3$

Radius of gyration, $r = \sqrt{\frac{I}{A_g}} = \sqrt{\frac{168.8}{14.92}} = 3.363\ in$

Plastic section modulus, $Z = \frac{OD^3\text{-}ID^3}{6} = 45.17\ in^3$

HSS Torsional constant, $C = \frac{\pi}{2}(OD\text{-}t)^2 t = 70.88\ in^3$

Section Classification

Flange in compression

$$\lambda = \frac{\mathrm{OD}}{t} = \frac{10}{0.5} = 20$$

Per Table B4.1a, Case 9, $\lambda < \lambda_r = 0.11\frac{E}{F_y} = 63.8$, therefore flanges are non-slender for compression. The web is similarly non-slender for compression.

Flange in bending (use half the longer flange width as the outstanding width):

$$\lambda = \frac{\mathrm{OD}}{t} = \frac{10}{0.5} = 20$$

Per Table B4.1b, Case20, $\lambda < \lambda_r = 0.07\frac{E}{F_y} = 40.6$, therefore flange is compact for bending.

Compression Capacity

$$\frac{kL}{r} = \frac{1.0(60)}{3.363} = 17.84 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,\ 000}{50}} = 113.4$$

$$F_e = \frac{\pi^2 E}{\left(\frac{kL}{r}\right)^2} = \frac{\pi^2 \times 29{,}000}{(17.84)^2} = 899.4 \text{ ksi} \quad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_e} = \frac{50}{899.4} = 0.056 < 2.25$$

$$F_{\text{crx}} = 0.658^{F_y / F_e} F_y = 0.658^{(0.056)} 50 = 48.85 \text{ ksi} \quad \text{(Eq. E3-2)}$$

$$P_n = A_g \times F_{cr} = 14.92 \times 48.85 = 729.0 \text{ kips} \quad \text{(Eq. E3-1)}$$

The axial capacity:

The ultimate compression capacity (LRFD) = $\phi_c P_n = 0.9 \times 729.0 = 656.1$ *kips*
The allowable compression capacity (ASD) = $P_n / \Omega_c = 729.0 / 1.67 = 436.5$ *kips*

Shear Capacity

The distance from the maximum shear force (ends) to zero shear force (mid-span), $L_v = L / 2 = 30$ *in.*

The critical shear stress, F_{cr}, *is the minimum of*:

$$F_{\text{cr1}} = \frac{1.60E}{\sqrt{\frac{L_v}{\text{OD}}} \left(\frac{\text{OD}}{t}\right)^{5/4}} = 633.4 \text{ ksi}$$

$$F_{\text{cr2}} = \frac{0.78E}{\left(\frac{\text{OD}}{t}\right)^{3/2}} = 252.9 \text{ ksi}$$

$$F_{\text{cr3}} = 0.6F_y = 30 \text{ ksi}$$

$F_{cr} = 30$ *ksi*

Nominal shear capacity:

$$V_n = F_{\text{cr}} A_g / 2 = 223.8 \text{ kips}$$

The shear capacity:

The ultimate shear capacity (LRFD) = $\phi_c V_n = 0.9 \times 223.8 = 201.5$ *kips*
The allowable shear capacity (ASD) = $V_n / \Omega_c = 223.8 / 1.67 = 134.0$ *kips*

Calculate Bending Capacity

Bending capacity in plastic yielding:

$$M_p = F_y \times Z = 50 \times 45.17 = 2{,}259 \text{ in·kips} < 1.6F_y \times S = 1.6\,(50)\,(33.76) = 2{,}701 \text{ in·kips}$$

The bending capacity for flexural yielding:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 2{,}259 = 2{,}033$ *in·kips*
The allowable bending capacity (ASD) = $M_y / \Omega_b = 2{,}259 / 1.67 = 1{,}352$ *in·kips*

Torsional Capacity

The critical stress, F_{cr}, *is the larger of*:

$$F_{cr1} = \frac{1.23E}{\sqrt{\frac{L}{OD}}\left(\frac{OD}{t}\right)^{5/4}} = 344.3 \text{ ksi}$$

$$F_{cr2} = \frac{1.23E}{\left(\frac{OD}{t}\right)^{3/2}} = 194.5 \text{ ksi}$$

But shall not exceed:

$$F_{cr3} = 0.6F_y = 30 \text{ ksi}$$

$F_{cr} = 30\ ksi$

Nominal torsional capacity:

$$T_n = F_{cr}C = 2{,}126 \text{ in}\cdot\text{kips}$$

The torsional capacity:

The ultimate torsional capacity (LRFD) = $\phi_c T_n = 0.9 \times 2{,}126 = 1{,}914\ kips$
The allowable torsional capacity (ASD) = $T_n / \Omega_c = 2{,}126\ /\ 1.67 = 1{,}273\ kips$

<u>Interaction Ratio for Bending and Compression</u>

Check the interaction ratio for Load Case 1:

$$\frac{P_r}{P_c} = \frac{10.23}{656.1} = 0.016 < 0.2 \text{ (LRFD)}$$

$$\frac{P_r}{P_c} = \frac{10.23}{436.5} = 0.023 < 0.2 \text{ (ASD)}$$

So use Eq. H1-1b for both methods: $\frac{P_r}{2P_c} + \left(\frac{M_{rx}}{M_{cx}} + \frac{M_{ry}}{M_{cy}}\right) \leq 1.0.$

$$\frac{0.016}{2} + \left(\frac{505.7}{2{,}033} + \frac{0}{2{,}033}\right) = 0.257 \text{ (LRFD)}$$

$$\frac{0.023}{2} + \left(\frac{505.7}{1{,}352} + \frac{0}{1{,}352}\right) = 0.386 \text{ (ASD)}$$

Results

Result Type		Reference	STAAD.Pro	Difference	Comments

The following D1.A.6 Design Parameters (on page 1100) are used:

- The welded tapered member is specified using `STP 2`

The remaining parameters all use their default values.

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 Tapered Tube Section.STD` is typically installed with the program.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

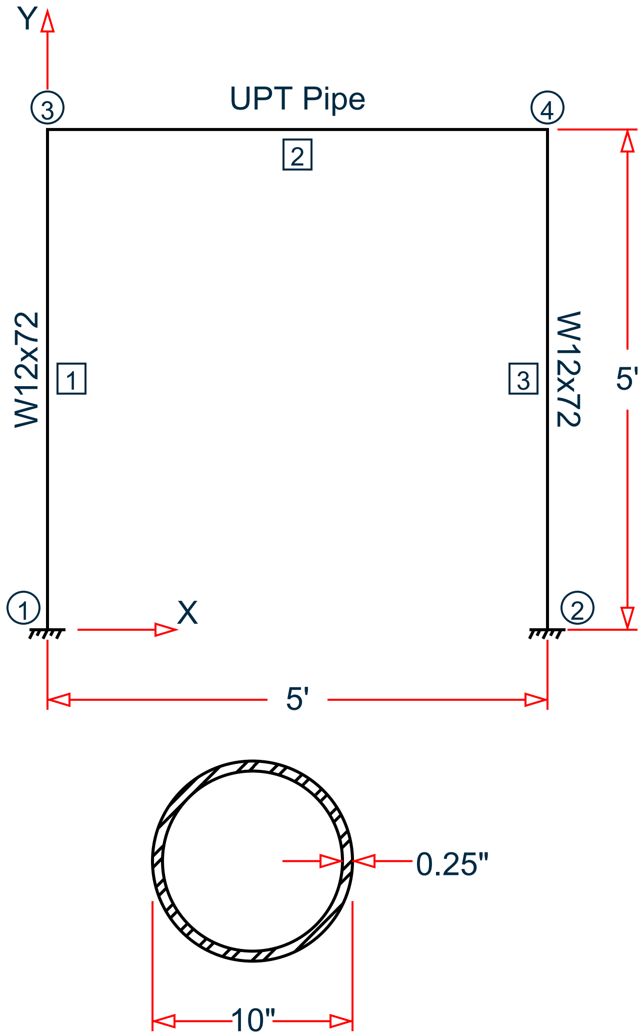
V. AISC 360-16 UPT Pipe Section

Verify the axial compression capacity, shear capacity, flexure capacity, torsional capacity, and interaction ratio of a user-provided pipe section member per both the LRFD and ASD methods of the AISC 360-16 code.

Details

A 5' × 5' portal frame consists of W12x72 columns and a UPT pipe member for the beam. The pipe outer diameter, D, is 10" and the thickness, t, is 0.25".



Section

The following load cases are evaluated:

1. A uniformly distributed load of -2.25 k/in along the beam in the global Y direction.
2. Lateral loads at the top of the left column of 50 kips in the global X direction and 25 kips in the global Z direction (out of plane).
3. A concentrated torque of 0.75 in·kips at mid-span of the beam.

Material Properties

E = 29,000 ksi
Fy = 50 ksi

Validation

Design Forces

The following design loads are used from the STAAD.Pro analysis are then used:

1. M_z = 599.6 in·kips, F_y = 67.5 kips

Section Properties

Inner diameter, $d = 10 - 2 \times 0.25 = 9.5$ in.
Area, $A_g = \frac{\pi}{4}\left(D^2 - d^2\right) = 7.66\ in^2$
Shear area, $A_y = A_x = A_g\ /\ 2 = 3.83\ in^2$
Moment of inertia, $I_x = I_y = \frac{\pi}{64}\left(D^4 - d^4\right) = 91.05\ in^4$
Elastic section modulus, $S_{xx} = \frac{I_{xx}}{D\ /\ 2} = \frac{91.05}{10\ /\ 2} = 18.21\ in^3$
Radius of gyration, $r_x = \sqrt{\frac{I_{xx}}{A_g}} = \sqrt{\frac{91.05}{7.66}} = 3.448\ in$
Plastic section modulus, $Z_x = \frac{1}{6}\left(D^3 - d^3\right) = 23.77\ in^3$
HSS Torsional constant, $C = \frac{\pi}{2}(D - t)^2 t = 37.33\ in^3$

Section Classification

Flange in compression

$$\lambda = \frac{D}{t} = \frac{10}{0.25} = 40$$

Per Table 4.1a Case 9, $\lambda < \lambda_r = 0.11\frac{E}{F_y} = 0.11\frac{29{,}000}{50} = 63.8$, therefore flanges are non-slender for compression.

Web in compression

Per Table 4.1a, Case 9, $\lambda < \lambda_r = 0.11\frac{E}{F_y} = 0.11\frac{29{,}000}{50} = 63.8$, therefore the web is non-slender for compression.

Flexure classification:

Per Table 4.1b, Case 20, $\lambda < \lambda_p = 0.07\frac{E}{F_y} = 0.11\frac{29{,}000}{50} = 40.6$, therefore flange is compact for bending.

Compression Capacity

Effective slenderness ratio:

$$\frac{k_x L_x}{r_x} = \frac{1.0(60)}{3.448} = 17.40 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,\ 000}{50}} = 113.4$$

Elastic buckling stress:

$$F_e = \frac{\pi^2 E}{\left(\frac{k_x L_x}{r_x}\right)^2} = \frac{\pi^2 \times 29,\ 000}{(17.40)^2} = 945\ \text{ksi} \qquad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_e} = \frac{50}{945} = 0.053 < 2.25$$

Critical buckling stress:

$$F_{cr} = 0.658^{F_y/F_e} F_y = 0.658^{(0.053)} 50 = 48.91 \text{ ksi} \quad \text{(Eq. E3-2)}$$

Nominal buckling strength:

$$P_n = A_g \times F_{cr} = 7.66 \times 48.91 = 374.5 \text{ kips} \quad \text{(Eq. E3-1)}$$

The axial capacity:

The ultimate compression capacity (LRFD) = $\phi_c P_n = 0.9 \times 374.5 = 337.0$ *kips*
The allowable compression capacity (ASD) = $P_n / \Omega_c = 374.5 / 1.67 = 224.3$ *kips*

Calculate Shear Capacity

Critical stress is the minimum of F_{cr1}, F_{cr2}, and F_{cr3}:

$$F_{cr1} = \frac{1.23E}{\sqrt{\frac{L}{D}}\left(\frac{D}{t}\right)^{\left(5/4\right)}} = 144.8 \text{ ksi}$$

$$F_{cr2} = \frac{0.78E}{\left(\frac{D}{t}\right)^{\left(3/2\right)}} = 89.4 \text{ ksi}$$

$$F_{cr3} = 0.6F_y = 30 \text{ ksi}$$

So, $F_{cr} = 30$ *ksi*.

The nominal shear strength:

$$V_n = F_{cr} \times A_x = 30 \times 3.83 = 114.9 \text{ kips}$$

The axial capacity:

The ultimate shear capacity (LRFD) = $\phi_v V_n = 0.9 \times 114.9 = 103.4$ *kips*
The allowable shear capacity (ASD) = $V_n / \Omega_v = 114.9 / 1.67 = 68.78$ *kips*

Calculate Bending Capacity

Bending capacity in plastic yielding (compact section):

$$M_y = F_y \times Z_x = 50 \times 23.77 = 1{,}189 \text{ in} \cdot \text{kips} \quad \text{(Eq F8-1)}$$

The bending capacity for flexural yielding about the Y axis:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 1{,}189 = 1{,}070$ *in·kips*
The allowable bending capacity (ASD) = $M_y / \Omega_b = 1{,}189 / 1.67 = 711.7$ *in·kips*

Interaction Ratio for Bending and Compression

Check the interaction ratio for Load Case 1:

$$\frac{P_r}{P_c} = \frac{11.75}{337.0} = 0.034 < 0.2 \text{ (LRFD)}$$

$$\frac{P_r}{P_c} = \frac{11.75}{224.3} = 0.052 < 0.2 \text{ (ASD)}$$

So use Eq. H1-1b for both methods: $\frac{P_r}{2P_c} + \left(\frac{M_{rx}}{M_{cx}} + \frac{M_{ry}}{M_{cy}}\right) \le 1.0$.

$$\frac{0.034}{2} + \left(\frac{599.6}{1{,}070} + \frac{0}{1{,}070}\right) = 0.578 \text{ (LRFD)}$$

$$\frac{0.052}{2} + \left(\frac{599.6}{711.7} + \frac{0}{711.7}\right) = 0.869 \text{ (ASD)}$$

Calculate Torsion Capacity

Critical stress is the minimum of F_{cr1}, F_{cr2}, and F_{cr3}. From shear calculations, $F_{cr} = 30\ ksi$.

The nominal shear strength:

$$T_n = F_{cr} \times C = 30 \times 37.33 = 1{,}120 \text{ in·kips}$$

The axial capacity:

The ultimate torsional capacity (LRFD) = $\phi_T T_n = 0.9 \times 1{,}120 = 1{,}008\ in·kips$
The allowable torsional capacity (ASD) = $T_n / \Omega_T = 114.9\ /\ 1.67 = 670.6\ in·kips$

Results

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 UPT Pipe Section.STD` is typically installed with the program.

The following D1.A.6 Design Parameters (on page 1100) are used:

- The welded pipe member is specified using `STP 2`
- Shear lag factor, U for tension rupture capacity is specified by `SLF 0.8`

The remaining parameters all use their default values.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

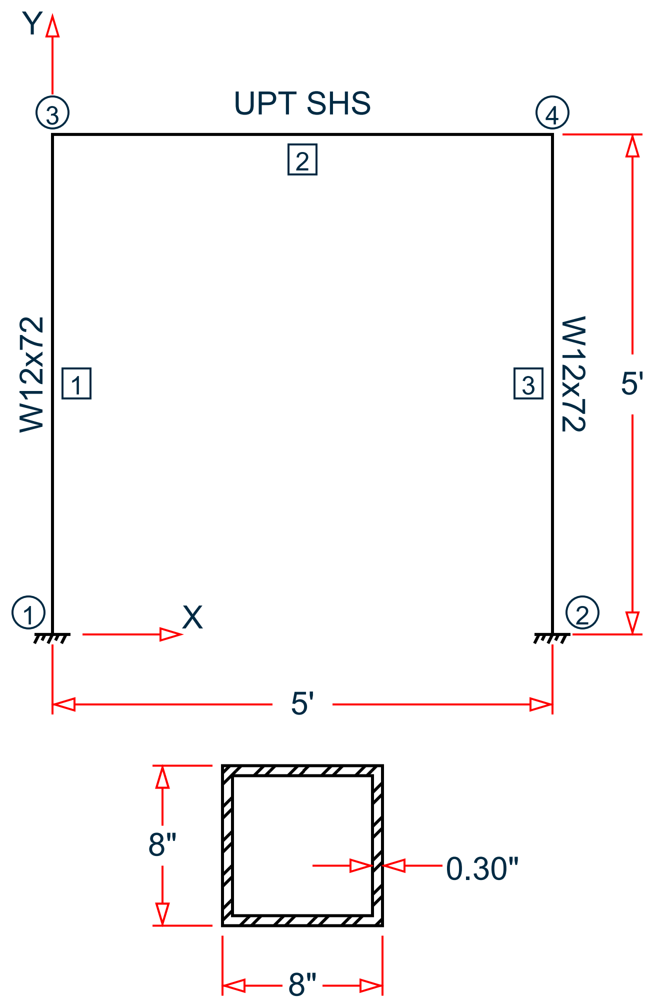
V. AISC 360-16 UPT Square Hollow Section

Verify the axial compression capacity, shear capacity, flexure capacity, torsional capacity, and interaction ratio of a user-provided hollow square section member per both the LRFD and ASD methods of the AISC 360-16 code.

Details

A 5' × 5' portal frame consists of W12x72 columns and a UPT SHS member for the beam. The section outer depth, D, is 8" and the thickness, t, is 0.30".



Section

The following load cases are evaluated:

1. A uniformly distributed load of -2.25 k/in along the beam in the global Y direction.
2. Lateral loads at the top of the left column of 50 kips in the global X direction and 25 kips in the global Z direction (out of plane).
3. A concentrated torque of 0.75 in·kips at mid-span of the beam.

Material Properties

E = 29,000 ksi
Fy = 50 ksi

Validation

<u>Design Forces</u>

The following design loads are used from the STAAD.Pro analysis are then used:

1. M_z = 599.6 in·kips, F_y = 67.5 kips

Section Properties

Inner depth, $d = 8 - 2\times0.30 = 7.40\ in.$

Area, $A_g = D^2 - d^2 = 9.24\ in^2$

Shear area, $A_w = 2\times D\times t_w = 4.80\ in^2$

Moment of inertia, $I = \frac{1}{12}\left(D^4 - d^4\right) = 91.45\ in^4$

Elastic section modulus, $S = \frac{I}{D/2} = \frac{91.45}{8/2} = 22.86\ in^3$

Radius of gyration, $r = \sqrt{\frac{I}{A_g}} = \sqrt{\frac{91.45}{9.24}} = 3.146\ in$

Plastic section modulus, $Z = \frac{1}{6}\left(D^3 - d^3\right) = 26.69\ in^3$

HSS Torsional constant, $C = 2\left(B - t_w\right)\left(D - t_w\right)t_w - 4.5\left(4 - \pi\right){t_w}^3 = 35.47\ in^3$

Section Classification

The design thickness, $t = 0.93\times t_w = 0.279\ in$

The design depth, $d = D - 3t = 7.163\ in$

Flange in compression

$$\lambda = \frac{d}{t} = \frac{7.163}{0.279} = 25.67$$

Per Table 4.1a Case 6, $\lambda < \lambda_r = 1.40\sqrt{\frac{E}{F_y}} = 1.40\sqrt{\frac{29{,}000}{50}} = 33.72$, therefore flanges are non-slender for compression. Similar for the web of the square section.

Flexure classification of flange:

Per Table 4.1b, Case 17, $\lambda < \lambda_p = 1.12\sqrt{\frac{E}{F_y}} = 1.12\sqrt{\frac{29{,}000}{50}} = 26.97$, therefore flange is compact for bending.

Flexure classification of web:

Per Table 4.1b, Case 19, $\lambda < \lambda_p = 2.42\sqrt{\frac{E}{F_y}} = 2.42\sqrt{\frac{29{,}000}{50}} = 58.28$, therefore web is compact for bending.

Compression Capacity

Effective slenderness ratio:

$$\frac{k_x L_x}{r_x} = \frac{1.0(60)}{3.146} = 19.07 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,\ 000}{50}} = 113.4$$

Elastic buckling stress:

$$F_e = \frac{\pi^2 E}{\left(\frac{k_x L_x}{r_x}\right)^2} = \frac{\pi^2 \times 29,\ 000}{(19.07)^2} = 787\ \text{ksi} \tag{Eq. E3-4}$$

$$\frac{F_y}{F_e} = \frac{50}{787} = 0.064 < 2.25$$

Critical buckling stress:

$$F_{cr} = 0.658^{F_y / F_e} F_y = 0.658^{(0.064)} 50 = 48.68 \text{ ksi} \qquad \text{(Eq. E3-2)}$$

Nominal buckling strength:

$$P_n = A_g \times F_{cr} = 9.24 \times 48.68 = 449.9 \text{ kips} \qquad \text{(Eq. E3-1)}$$

The axial capacity:

The ultimate compression capacity (LRFD) = $\phi_c P_n = 0.9 \times 449.9 = 404.9 \; kips$
The allowable compression capacity (ASD) = $P_n / \Omega_c = 449.9 \; / \; 1.67 = 269.4 \; kips$

Calculate Shear Capacity The nominal shear strength:

$$V_n = 0.6 \times F_y \times A_w \times C_{v2} \qquad \text{(Eq. G4-1)}$$

where

C_{v2} = *1.0* per Section G2.2 with $h/t = 25.67$ and $K_v = 5$.

$$V_n = 0.6\ (50)\ (4.80)\ (1.0) = 144 \text{ kips}$$

The shear capacity:

The ultimate shear capacity (LRFD) = $\phi_v V_n = 0.9 \times 144 = 129.6 \; kips$
The allowable shear capacity (ASD) = $V_n / \Omega_v = 144 \; / \; 1.67 = 86.23 \; kips$

Calculate Bending Capacity

Bending capacity in plastic yielding (compact section):

$$M_p = F_y \times Z_x = 50 \times 26.69 = 1{,}335 \text{ in·kips} \qquad \text{(Eq F7-1)}$$

The bending capacity for flexural yielding about the Y axis:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 1{,}335 = 1{,}201 \; in \cdot kips$
The allowable bending capacity (ASD) = $M_y / \Omega_b = 1{,}335 \; / \; 1.67 = 799.2 \; in \cdot kips$

Torsional Capacity

$$\frac{h}{t} = 25.67 < 2.45\sqrt{\frac{E}{F_y}} = 59.0$$

$$F_{cr} = 0.6F_y = 30 \text{ ksi}$$

Nominal torsional capacity:

$$T_n = F_{cr} \times C = 1{,}064 \text{ ksi}$$

The torsional capacity:

The ultimate torsional capacity (LRFD) = $\phi_T T_n = 0.9 \times 1{,}064 = 957.7 \; kips$
The allowable torsional capacity (ASD) = $T_n / \Omega_T = 1{,}064 \; / \; 1.67 = 637.2 \; kips$

Interaction Ratio for Bending and Compression

Check the interaction ratio for Load Case 1:

$$\frac{P_r}{P_c} = \frac{11.80}{404.9} = 0.029 < 0.2 \text{ (LRFD)}$$

$$\frac{P_r}{P_c} = \frac{11.80}{269.4} = 0.044 < 0.2 \text{ (ASD)}$$

So use Eq. H1-1b for both methods: $\frac{P_r}{2P_c} + \left(\frac{M_{rx}}{M_{cx}} + \frac{M_{ry}}{M_{cy}}\right) \leq 1.0$.

$$\frac{0.029}{2} + \left(\frac{599.7}{1{,}201} + \frac{0}{1{,}201}\right) = 0.514 \text{ (LRFD)}$$

$$\frac{0.044}{2} + \left(\frac{599.7}{799.2} + \frac{0}{799.2}\right) = 0.765 \text{ (ASD)}$$

Results

Table 740:

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Compression capacity (kips)	404.9	404.9	none	
	Bending capacity (in·kips)	1,201	1,201	none	
	Shear capacity (kips)	129.6	129.6	none	
	Torsional capacity (in·kips)	957.7	957.7	none	
	Interaction ratio	0.514	0.514	none	
ASD	Compression capacity (kips)	269.4	269.4	none	
	Bending capacity (in·kips)	799.2	799.2	none	
	Shear capacity (kips)	86.23	86.23	none	
	Torsional capacity (in·kips)	637.2	637.2	none	
	Interaction ratio	0.765	0.772	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 UPT Square Hollow Section.STD` is typically installed with the program.

The following D1.A.6 Design Parameters (on page 1100) are used:

- The welded SHS member is specified using `STP 2`
- Shear lag factor, U for tension rupture capacity is specified by `SLF 0.8`

The remaining parameters all use their default values.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 C Tension ASD

Verify the tensile yield and tensile rupture strength of channel section with ASD method for AISC 360-16 code.

Details

The member is a C5x9 section. Steel grade is ASTM A992. Member is loaded with dead load of 15 kips and live load of 50 kips. The member is welded (i.e., no bolt holes) and the shear lag factor, U, is calculated as 0.908.

Validation

Service load: $P = DL + LL = 65\ kips$

Tensile Yielding

Nominal tensile yield strength:

$$P_{nY} = F_y A_g = 50 \times 2.64 = 132 \text{ kip} \qquad \text{[Eqn. D2-1]}$$

$$P_{nY}/\Omega_{tY} = 132 / 1.67 = 79.04 \text{ kip}$$

Ratio for tensile yield = 65 / 79.04 = 0.822

Tensile Rupture

Net area, $A_n = A_g = 2.64\ in^2$

Effective net area based on D3: $A_e = A_n \times U = 2.397\ in^2$

Nominal tensile rupture strength:

$$P_{nR} = F_u A_e = 65 \times 2.397 = 155.8 \text{ kip} \qquad \text{[Eqn. D2-2]}$$

$$P_{nR}/\Omega_{tR} = 155.8 / 2.00 = 77.9 \text{ kip}$$

Ratio for tensile yield = 65 / 77.9 = 0.834

Results

Table 741: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yield strength, P_{nY}/Ω_{tY} (kip)	79.04	79.04	none	
Ratio	0.822	0.822	none	
Tensile rupture strength, P_{nR}/Ω_{tR} (kip)	77.9	77.91	negligible	
Ratio	0.834	0.834	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 C Tension ASD.STD` is typically installed with the program.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
```

```
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 C Tension LRFD

Verify the tensile yield and tensile rupture strength of channel section with LRFD method for AISC 360-16 code.

Details

The member is a C5x9 section. Steel grade is ASTM A992. Member is loaded with dead load of 15 kips and live load of 50 kips. The member is welded (i.e., no bolt holes) and the shear lag factor, U, is calculated as 0.908.

Validation

Ultimate load: $P_u = 1.2 \times DL + 1.6 \times LL = 98\ kips$

Tensile Yielding

Nominal tensile yield strength:

$$P_{nY} = F_y A_g = 50 \times 2.64 = 132 \text{ kip} \quad \text{[Eqn. D2-1]}$$

$$\phi_{tY} P_{nY} = 0.9 \times 132 = 118.8 \text{ kip}$$

Ratio for tensile yield = 98 / 118.8 = 0.825

Tensile Rupture

Net area, $A_n = A_g = 2.64\ in^2$

Effective net area based on D3: $A_e = A_n \times U = 2.397\ in^2$

Nominal tensile rupture strength:

$$P_{nR} = F_u A_e = 65 \times 2.397 = 155.8 \text{ kip} \qquad \text{[Eqn. D2-2]}$$

$$\phi_{tR} P_{nR} = 0.75 \times 155.8 = 116.9 \text{ kip}$$

Ratio for tensile yield = 98 / 116.9 = 0.839

Results

Table 742: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yield strength, $\phi_{tY}P_{nY}$ (kip)	118.8	118.8	none	
Ratio	0.825	0.825	none	
Tensile rupture strength, $\phi_{tR}P_{nR}$ (kip)	116.9	116.9	negligible	
Ratio	0.839	0.839	none

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description

       Mx              MZ          Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 ======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V. AISC 360-16 I Tension LRFD

To verify the tensile yield strength of an I section using the LRFD method from the AISC 360-16 code.

Reference

1. *Steel Construction Manual*, 15th Edition, American Institute of Steel Construction, 2017

Related Links

- *D1.A.5.1 Axial Tension* (on page 1092)

Details

Verify the tensile yield and tensile rupture strength of an I section (W8X21) using the LRFD method. The material is A992 ($F_y = 50\ ksi$, $F_u = 65\ ksi$)

The area of the bolt holes is assumed to be zero. A known shear lag factor of 0.908 is directly specified.

The length of the member is 25 ft. It is loaded axial in tension with a dead load of 30 kips and a live load of 90 kips.

Validation

The factored axial load, $P_u = 1.2 \times 30 + 1.6 \times 90 = 180\ kips$

<u>Tensile Yield Strength</u>

The tensile yield strength: $\phi_{tY} P_{nY} = \phi_{tY} \times F_y \times A_g = 0.9 \times 50 \times 6.16 = 277.2\ kips$

Ratio for yield strength: 0.649

<u>Tensile Rupture Strength</u>

For this example, A_n is assumed equal to A_g .

Effective area, $A_e = A_n \times U = 6.16 \times 0.908 = 5.593\ in^2$

The tensile rupture strength = $\phi_{tR}P_{nR} = \phi_{tR}{\times}F_u{\times}A_e = 0.75{\times}65{\times}5.593 = 272.672\ kips$

Ratio for rupture strength: 0.660

Results

Table 743: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Tensile yield strength (kips)	277.2	277.2	none	
Ratio	0.649	0.649	none	
Tensile rupture strength (kips)	272.7	272.7	none	
Ratio	0.660	0.660	none

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       X               Z          Axis typically parallel to the sections
principal major axis.
       Y               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
```

```
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 L Tension ASD

Verify the tensile yield and tensile rupture strength of an angle section with ASD method for AISC 360-16 code.

Details

The member is an L4x4x1/2 section. Steel grade is ASTM A36. The member is axially loaded with dead load of 20 kips and a live load of 60 kips. The member is connected using bolts in 3/4"⌀ holes. The shear lag factor, U, is calculated as 0.869.

Validation

Service load: $P = DL + LL = 80\ kips$

<u>Tensile Yielding</u>

Nominal tensile yield strength:

$$P_{nY} = F_y A_g = 36 \times 3.75 = 135 \text{ kip} \qquad \text{[Eqn. D2-1]}$$

$$P_{nY}/\Omega_{tY} = 132 / 1.67 = 80.83 \text{ kip}$$

Ratio for tensile yield = 80 / 80.83 = 0.990

<u>Tensile Rupture</u>

Bolt hole area = $\pi(0.75/2)^2 = 0.44\ in^2$

Net area, $A_n = A_g - A_{bolthole} = 3.75 - 0.44 = 3.31\ in^2$

Effective net area based on D3: $A_e = A_n \times U = 2.875\ in^2$

Nominal tensile rupture strength:

$$P_{nR} = F_u A_e = 58 \times 2.875 = 166.7 \text{ kip} \qquad \text{[Eqn. D2-2]}$$

$$P_{nR}/\Omega_{tR} = 166.7 / 2.00 = 83.37 \text{ kip}$$

Ratio for tensile yield = 80 / 83.4 = 0.960

Results

Table 744: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yield strength, P_{nY}/Ω_{tY} (kip)	80.83	80.84	negligible	
Ratio	0.990	0.99	none	
Tensile rupture strength, P_{nR}/Ω_{tR} (kip)	83.37	83.45	negligible	
Ratio	0.960	0.959	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 L Tension ASD.STD` is typically installed with the program.

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       U               Z          Axis typically parallel to the sections
principal major axis.
       V               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
```

```
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V.AISC 360-16 L Tension LRFD

Verify the tensile yield and tensile rupture strength of an angle section with LRFD method for AISC 360-16 code.

Details

The member is an L4x4x1/2 section. Steel grade is ASTM A36. The member is axially loaded with dead load of 20 kips and a live load of 60 kips. The member is connected using bolts in 3/4"⌀ holes. The shear lag factor, U, is calculated as 0.869.

Validation

Ultimate load: $P_u = 1.2 \times DL + 1.6 \times LL = 120\ kips$

Tensile Yielding

Nominal tensile yield strength:

$$P_{nY} = F_y A_g = 36 \times 3.75 = 135 \text{ kip} \qquad \text{[Eqn. D2-1]}$$

$$\phi_{tY} P_{nY} = 0.9 \times 135 = 121.5 \text{ kip}$$

Ratio for tensile yield = 120 / 121.5 = 0.988

Tensile Rupture

Bolt hole area = $\pi(0.75/2)^2 = 0.44 \text{ in}^2$

Net area, $A_n = A_g - A_{bolthole} = 3.75 - 0.44 = 3.31\ in^2$

Effective net area based on D3: $A_e = A_n \times U = 2.875\ in^2$

Nominal tensile rupture strength:

$$P_{nR} = F_u A_e = 58 \times 2.875 = 166.7 \text{ kip} \qquad \text{[Eqn. D2-2]}$$

$$\phi_{tR} P_{nR} = 0.75 \times 166.7 = 125.1 \text{ kip}$$

Ratio for tensile yield = 80 / 83.4 = 0.960

Results

Table 745: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yield strength, $\phi_{tY}P_{nY}$ (kip)	121.5	121.5	none	
Ratio	0.988	0.988	none	
Tensile rupture strength, $\phi_{tR}P_{nR}$ (kip)	125.1	125.2	negligible	
Ratio	0.960	0.959	negligible

 ***NOTE : AISC 360-16 Design Statement for STAAD.Pro.
 *** AXIS CONVENTION ***:
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       U               Z          Axis typically parallel to the sections
principal major axis.
       V               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 =======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V. AISC 360-16 - Torsion

Verify the torsional strength of an angle section using the LRFD method in the AISC 360-16 code. Use the simple method for calculating torsional shears (i.e., no full twist analysis). Perform torsion checks per AISC Design Guide 9.

Reference

1. *Steel Construction Manual*, 15th Edition, American Institute of Steel Construction, 2017
2. *Torsional Analysis of Structural Steel Members* Deign Guide 9, American Institute of Steel Construction

Related Links

- *D1.A.5.6 Design for Torsion* (on page 1096)

Details

The angle section is an L 3x3x1/2 angle of ASTM A992 material. The member is a 2 ft long cantilever with a total end torque of 3.0 in·kips.

Validation

Maximum torsional shear stress: $\tau_f = T\frac{t_f}{J} = 3.0\frac{0.5}{0.234} = 6.41 ksi$

By observation, direct shear stress is zero (torsion loading only). Therefore, total torsional stress is = τ_f .

Torsional shear resistance: $\phi_T \times 0.6 \times F_y = 0.9 \times 0.6 \times 50 = 27\ ksi$

Ratio: $6.41\ ksi\ /\ 27\ ksi = 0.237$

Results

Table 746: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Torsional shear stress ratio	0.237	0.242	2.1%	Negligible difference when considering simplified method used by hand calculations

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-16 - Torsion.STD` is typically installed with the program.

```

```
 ========================
 The capacity results and intermediate results in the report follow the
notations
 and axes labels as defined in the AISC 360-16 code.
 The analysis results are reported in STAAD.Pro axis convention and the AISC
360:16
 design results are reported in AISC 360-16 code axis convention.
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       U               Z          Axis typically parallel to the sections
principal major axis.
       V               Y          Axis typically parallel to the sections
principal minor axis.
       Z               X          Longitudinal axis perpendicular to the
cross section.
 SECTION FORCES AXIS MAPPING: -
   AISC Spec.      STAAD.Pro      Description
  ------------    -----------     -------------
       Pz              FX         Axial force.
       Vy              FY         Shear force along minor axis.
       Vx              FZ         Shear force along major axis.
       Tz              MX         Torsional moment.
       My              MY         Bending moment about minor axis.
       Mx              MZ         Bending moment about major axis.
 *** DESIGN MESSAGES ***:
 ======================
    1. Section classification reported is for the cross section and loadcase
that
       produced the worst case design ratio for flexure/compression Capacity
results.
    2. Results for any Capacity/Check that is not relevant for a section/
loadcase
       based on the code clause in AISC 360-16 will not be shown in the
report.
    3. Bending results are reported as being �about� the relevant axis (X/Y),
while
       the results for shear are reported as being for shear forces �along�
the axis.
       E.g : Mx indicates bending about the X axis, while Vx indicates shear
along
       the X axis.

V. AISC 360-10 W Flex Memb F.1-1

Verify the major axis flexural strength of a wide flange section which is continuously braced per the LRFD and ASD methods of the AISC 360-10 code.

Details

From reference (2):

> Select an ASTM A992 W-shape beam with a simple span of 35 ft. Limit the member to a maximum nominal depth of 18 in. Limit the live load deflection to L/360. The nominal loads are a uniform dead load of 0.45 kip/ft and a uniform live load of 0.75 kip/ft. Assume the beam is continuously braced.

See example F.1-1A and F.1-1B in reference (2) for calculations.

Results

V. AISC 360-10 W LTB Test F.1-2

Verify the lateral-torsional buckling flexural strength of a wide flange section that is braced at the third points per the LRFD and ASD methods of the AISC 360-10 code.

Note: This reference is freely available for download from the AISC website at https://www.aisc.org/globalassets/aisc/university-programs/teaching-aids/first-semester-design-examples.pdf

Details

From reference (2):

> Verify the available flexural strength of the W18×50, ASTM A992 beam selected in Example F.1-1A with the beam braced at the ends and third points.

See example F.1-2A and F.1-2B in reference (2) for calculations.

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	305	306	negligible	
M_n / Ω_b (ft·k) [ASD]	203	203	none

Problem

From reference (2):

> Verify the available flexural strength of the W18×50, ASTM A992 beam selected in Example F.1-1A with the beam braced at the ends and center point.

See example F.1-3B in reference (2) for calculations.

Comparison

Table 747: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·kips) [LRFD]	289	3,460 in-kips = 288.3	negligible	
M_n/Ω_b (ft·kips) [ASD]	191	2,300 in-kips = 191.7	negligible	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 - F.STD` is typically installed with the program.

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

V. AISC 360-10 C Flex Mem F.2-1

Verify the major axis flexural strength of a compact channel section which is continuously braced per the LRFD and ASD methods for AISC 360-10 code.

References

2. American Institute of Steel Construction. 2011. *Design Examples, Version 14.0*. AISC:Chicago, IL. Example F. 2-1A and F.2-1B, pp. F16-F18

Details

From reference (2):

> Select an ASTM A36 channel to serve as a roof edge beam with a simple span of 25 ft. Limit the live load deflection to L/360. The nominal loads are a uniform dead load of 0.23 kip/ft and a uniform live load of 0.69 kip/ft. The beam is continuously braced.

Validation

Ultimate moment:

$$w_u = 1.2(0.23 \text{ k/ft}) + 1.6(0.69 \text{ k/ft}) = 1.38 \text{ k/ft}$$

$$M_u = \frac{1.38(25)^2}{8} = 108 \text{ ft-k}$$

Service moment:

$$w_a = 0.23 \text{ k/ft} + 0.69 \text{ k/ft} = 0.92 \text{ k/ft}$$

$$M_a = \frac{0.92(25)^2}{8} = 71.9 \text{ ft-k}$$

Try a C15×33.9, which has a plastic section modulus, $Z_x = 50.8\ in^3$.

All ASTM A36 grade C-shapes are compact. The member is continuously braced, so therefore the yielding limit state governs.

$$M_n = M_p = F_y \times Z_x = 36 \times 50.8 = 1{,}830 \text{ in-k} = 152 \text{ ft-k}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(152) = 137\ ft\text{-}k$

ASD: $M_n / \Omega_b = {}^{152}/_{1.67} = 91.0\ ft\text{-}k$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	137	137	none	

Result Type	Reference	STAAD.Pro	Difference	Comments
M_n/Ω_b (ft·k) [ASD]	91	91.3	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 C Flex Mem F.STD` is typically installed with the program.

V. AISC 360-10 C LTB Test F.2-2

Verify the lateral flexural strength of a compact channel section braced at the fifth points per the LRFD and ASD methods of the AISC 360-10 code.

Reference

1. American Institute of Steel Construction. 2010 *Steel Construction Manual. Fourteenth Edition*. AISC: Chicago, IL.
2. American Institute of Steel Construction. 2011. *Design Examples, Version 14.0*. AISC:Chicago, IL. Example F. 2-2A and F.2-2B, pp F-19 - F21

Problem

Check a C15x33.9 channel of ASTM A36 steel which serves as a roof edge beam. The simple span is 25 ft. The nominal loads on the member are a dead load 0.23 kip/ft and a uniform live load of 0.69 kip/ft. The beam is braced at fifth points and at ends.

Validation

Ultimate moment:

$$w_u = 1.2(0.23\text{ k/ft}) + 1.6(0.69\text{ k/ft}) = 1.38\text{ k/ft}$$

$$M_u = \frac{1.38(25)^2}{8} = 108\text{ ft-k}$$

Service moment:

$$w_a = 0.23\text{ k/ft} + 0.69\text{ k/ft} = 0.92\text{ k/ft}$$

$$M_a = \frac{0.92(25)^2}{8} = 71.9\text{ ft-k}$$

The unbraced length, >$L_b = 5\ ft$.

Try a C15×33.9, which has a plastic section modulus, $Z_x = 50.8\ in^3$.

The lateral-torsional buckling modification factor, $C_b = 1.0$ for the center span of this bracing & loading condition.

$$L_p = 1.76 r_y \sqrt{\frac{E}{F_y}} = 1.76(0.901)\sqrt{\frac{29,000}{36}}\left(\frac{1}{12}\right) = 3.75\text{ft} \quad \text{(F2-5)}$$

$$L_r = \pi r_{ts}\sqrt{\frac{E}{0.7F_y}} = \pi(1.13)\sqrt{\frac{29,000}{0.7 \times 36}}\left(\frac{1}{12}\right) = 10.0 \text{ ft} \tag{F2-6}$$

Note: This is the simplified, conservative calculation for L_r per the User Note used to verify that the section is in the plastic-elastic range. The reference uses the more exact calculation but the resulting flexural strength values are essentially equal.

$$L_p < L_b \leq L_r$$

All ASTM A36 grade C-shapes are compact.

The nominal flexural strength for the flexural yielding limit state is:

$$M_n = M_p = F_y \times Z_x = 36 \times 50.8 = 1{,}830 \text{ in-k} = 152 \text{ ft-k}$$

The nominal flexural strength for the lateral-torsional buckling limit state is:

$$M_n = C_b\left[M_p - (M_p - 0.7F_y S_x)\left(\frac{L_b - L_p}{L_r - L_p}\right)\right]$$

$$= 1.0\left[1,830 - (1,830 - 0.7 \times 36 \times 42)\left(\frac{5 - 3.75}{10 - 3.75}\right)\right]\left(\frac{1}{12}\right) = 145 \text{ ft-k}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(145) = 131 \text{ ft-k}$

ASD: $M_n / \Omega_b = {}^{131}/_{1.67} = 86.8 \text{ ft-k}$

Comparison

Table 748: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (kips) [LRFD]	131	130	negligible	
M_n/Ω_b (kips) [ASD]	86.8	86.7	negligible	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 C LTB Test F.STD` is typically installed with the program.

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

V. AISC 360-10 W Local Buckling F.3

Verify the leg local buckling flexural strength of a non-compact wide flange section per the LRFD and ASD methods of the AISC 360-10 code.

Details

From reference (2):

> Select an ASTM A992 W-shape beam with a simple span of 40 ft. The nominal loads are a uniform dead load of 0.05 kip/ft and two equal 18 kip concentrated live loads acting at the third points of the beam. The beam is continuously braced.

See example F.3A and F.3B in reference (2) for calculations.

Results

Details

From reference (2):

> Select an ASTM A992 W-shape flexural member by the moment of inertia, to limit the live load deflection to 1 in. The span length is 30 ft. The loads are a uniform dead load of 0.80 kip/ft and a uniform live load of 2 kip/ft. The beam is continuously braced.

See example F.4 in reference (2) for calculations.

Results

V. AISC 360-10 I Minor Axis Bending F.5

Verify the minor axis bending capacity of an I-shaped flexural member under minor axis bending per the AISC 360-10 code.

Details

From reference (2):

> Select an ASTM A992 W-shape beam loaded in its minor axis with a simple span of 15 ft. The loads are a total uniform dead load of 0.667 kip/ft and a uniform live load of 2 kip/ft. Limit the live load deflection to L/240. The beam is braced at the ends only.

See example F.5 in reference (2) for calculations.

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	122	122	none	
M_n/Ω_b (ft·k) [ASD]	81.4	81.1	negligible

V. AISC 360-10 HSST Compact Flange F.6

Verify the available flexural strength of a square HSS flexural member with compact flanges per the AISC 360-10 code.

References

1. American Institute of Steel Construction. 2010 *Steel Construction Manual. Fourteenth Edition*. AISC: Chicago, IL.
2. American Institute of Steel Construction. 2011. *Design Examples, Version 14.0*. AISC:Chicago, IL. Example F.6, pp. F30-F31

Details

From reference (2):

> Select a square ASTM A500 Grade B HSS beam to span 7.5 ft. The loads are a uniform dead load of 0.145 kip/ft and a uniform live load of 0.435 kip/ft. Limit the live load deflection to L/240. The beam is continuously braced.

Validation

Ultimate moment:

$$w_u = 1.2(0.145 \text{ k/ft}) + 1.6(0.435 \text{ k/ft}) = 0.87 \text{ k/ft}$$

$$M_u = \frac{0.87(7.5)^2}{8} = 6.12 \text{ ft}\cdot\text{k}$$

Service moment:

$$w_a = 0.145 \text{ k/ft} + 0.435 \text{ k/ft} = 0.580 \text{ k/ft}$$

$$M_a = \frac{0.58(7.5)^2}{8} = 4.08 \text{ ft}\cdot\text{k}$$

Try a HSS 3 1/2×3 1/2×1/8, which has a plastic section modulus, $Z_x = 1.93\ in^3$.

The yield strength, $F_y = 46\ ksi$

Flange compactness: $\lambda = b/t = 27.2$

Determine the compact flange ratio limit from Table B4.1b: $\lambda_p = 1.12\sqrt{\frac{E}{F_y}} = 1.12\sqrt{\frac{29,000}{46}} = 28.1 > \lambda$ (Compact)

$$M_n = M_p = F_y \times Z_x = 46 \times 1.93 = 88.8 \text{ in-k} = 7.40 \text{ ft-k}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(7.40) = 6.66\ ft\cdot k$

ASD: $M_n / \Omega_b = {}^{7.40}\!/_{1.67} = 4.43\ ft\cdot k$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	6.66*	6.66	none	
M_n/Ω_b (ft·k) [ASD]	4.43*	4.43	none	

* The reference gives $\phi_b M_n = 6.67\ ft\cdot k$ *and* $M_n/\Omega_b = 4.44$, *respectively. The differences are due to either rounding differences.*

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 HSST Compact Flange F.STD` is typically installed with the program.

Details

From reference (2):

Select a rectangular ASTM A500 Grade B HSS beam with a span of 21 ft. The loads include a uniform dead load of 0.15 kip/ft and a uniform live load of 0.4 kip/ft. Limit the live load deflection to L/240. The beam is braced at the end points only.

Validation

Ultimate moment:

$$w_u = 1.2(0.15\text{ k/ft}) + 1.6(0.4\text{ k/ft}) = 0.82\text{ k/ft}$$

$$M_u = \frac{0.82(21)^2}{8} = 45.2\text{ ft-k}$$

Service moment:

$$w_a = 0.15\text{ k/ft} + 0.4\text{ k/ft} = 0.55\text{ k/ft}$$

$$M_a = \frac{0.55(21)^2}{8} = 30.3\text{ ft-k}$$

Try a HSS 10×6×3/16, which has a plastic section modulus, $Z_x = 18.0\ in^3$ and a section modulus, $S_x = 14.9\ in^3$.

Flange compactness: $\lambda = b/t = 31.5$

Determine the compact and slender flange ratio limits from Table B4.1b:

$$\lambda_p = 1.12\sqrt{\frac{E}{F_y}} = 1.12\sqrt{\frac{29{,}000}{46}} = 28.1$$

$$\lambda_r = 1.40\sqrt{\frac{E}{F_y}} = 1.40\sqrt{\frac{29{,}000}{46}} = 35.2$$

Thus, the section has a non-compact flange.

Web compactness: $\lambda = h/t = 54.5$

$$\lambda_p = 2.42\sqrt{\frac{E}{F_y}} = 2.42\sqrt{\frac{29{,}000}{46}} = 60.8 > \lambda$$

Thus, the section has a compact web.

$$M_p = F_y \times Z_x = 46 \times 18.0 = 828\text{ in-k} = 69.0\text{ ft}\cdot\text{k}$$

$$M_n = M_p - (M_p - F_y S)\left(3.57\frac{b}{t}\sqrt{\frac{F_y}{E}} - 4.0\right) \qquad \text{(F7-2)}$$

$$= 828 - (828 - 0.7 \times 46 \times 14.9)\left(3.57 \times 31.5\sqrt{\frac{46}{29{,}000}} - 4.0\right) = 760\text{ in-k} = 63.3\text{ ft}\cdot\text{k}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(63.3) = 57.0\ ft \cdot k$

ASD: $M_n / \Omega_b = {}^{63.3}\!/_{1.67} = 37.9\ ft \cdot k$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	57.0	57.0	none	
M_n/Ω_b (ft·k) [ASD]	37.9	37.9	none

V. AISC 360-10 HSST Slender Flange F.8

Verify the available flexural strength of a square HSS flexural member with slender flanges per the AISC 360-10 code.

References

1. American Institute of Steel Construction. 2010 *Steel Construction Manual. Fourteenth Edition*. AISC: Chicago, IL.
2. American Institute of Steel Construction. 2011. *Design Examples, Version 14.0*. AISC:Chicago, IL. Example F.8A and F.8B, pp. F36-F40

Details

From reference (2):

> Verify the strength of an ASTM A500 Grade B HSS8×8×x with a span of 21 ft. The loads are a dead load of 0.125 kip/ft and a live load of 0.375 kip/ft. Limit the live load deflection to L/240. The beam is continuously braced.

Validation

Ultimate moment:

$$w_u = 1.2(0.125\text{ k/ft}) + 1.6(0.375\text{ k/ft}) = 0.75\text{ k/ft}$$

$$M_u = \frac{0.75(21)^2}{8} = 41.3\text{ ft}\cdot\text{k}$$

Service moment:

$$w_a = 0.125\text{ k/ft} + 0.375\text{ k/ft} = 0.50\text{ k/ft}$$

$$M_a = \frac{0.5(21)^2}{8} = 27.6\text{ ft}\cdot\text{k}$$

Try a HSS 8×8×3/16, which has a plastic section modulus, $Z_x = 15.7\ in^3$ *and a section modulus,* $S_x = 13.6\ in^3$.

The yield strength, $F_y = 46\ ksi$

Flange compactness: $\lambda = b / t = 43.0$

Determine the slender flange ratio limit from Table B4.1b: $\lambda_r = 1.40\sqrt{\frac{E}{F_y}} = 1.12\sqrt{\frac{29{,}000}{46}} = 35.2 < \lambda$ (Slender)

Web compactness: $\lambda = h / t = 43.0$

$$\lambda_p = 2.42\sqrt{\frac{E}{F_y}} = 2.42\sqrt{\frac{29{,}000}{46}} = 60.8 > \lambda$$

Thus, the section has a compact web.

$$M_n = F_y \times S_e \qquad \text{(F7-3)}$$

where

S_e = the effective section modulus determined with the effective compression flange taken as b_e

b_e = $1.93t_f\sqrt{\frac{E}{F_y}}\left[1 - \frac{0.38}{b / t_f}\sqrt{\frac{E}{F_y}}\right] = 1.93 \times 0.174\sqrt{\frac{29{,}000}{46}}\left[1 - \frac{0.38}{0.43}\sqrt{\frac{29{,}000}{46}}\right] = 6.53\ in$

The width of the compression flange between the corners (assumed to be $1.5t$) is:

$$b = 8 - 2 \times 1.5 \times t = 8 - 3(0.174) = 7.48\text{ in} > 6.53\text{ in}$$

Thus, the ineffective width of the compression flange is: $b - b_e = 7.48 - 6.53 = 0.95\ in$

Subtract this contribution of this ineffective flange area from the gross moment of inertia to approximate the effective moment of inertia:

$$I_{\text{eff}} \approx 54.4 - 2\left[\frac{0.95(0.174)^3}{12} + 0.95(0.174)(3.91)^3\right] = 49.3\text{ in}^4$$

$$S_e = \frac{I_{\text{eff}}}{d / 2} = \frac{49.3}{8.0 / 2} = 12.3\text{ in}^3$$

$$M_n = \ = 46 \times 12.3 = 566\text{ in-k} = 47.2\text{ ft-k}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(47.2) = 42.5\ ft\cdot k$

ASD: $M_n / \Omega_b = {}^{47.2}/_{1.67} = 28.3\ ft\cdot k$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	42.5	42.5	none	
M_n/Ω_b (ft·k) [ASD]	28.3	28.3	none

V. AISC 360-10 Pipe F.9

Verify the available flexural strength of a compact pipe member per the AISC 360-10 code.

References

1. American Institute of Steel Construction. 2010 *Steel Construction Manual. Fourteenth Edition*. AISC: Chicago, IL.
2. American Institute of Steel Construction. 2011. *Design Examples, Version 14.0*. AISC:Chicago, IL. Example F.9A and F.9B, pp. F41-F43

Details

From reference (2):

> Select an ASTM A53 Grade B Pipe shape with an 8-in. nominal depth and a simple span of 16 ft. The loads are a total uniform dead load of 0.32 kip/ft and a uniform live load of 0.96 kip/ft. There is no deflection limit for this beam. The beam is braced only at the ends.

Validation

Ultimate moment:

$$w_u = 1.2(0.32 \text{ k/ft}) + 1.6(0.96 \text{ k/ft}) = 1.92 \text{ k/ft}$$

$$M_u = \frac{1.92(16)^2}{8} = 61.4 \text{ ft·k}$$

Service moment:

$$w_a = 0.32 \text{ k/ft} + 0.96 \text{ k/ft} = 1.28 \text{ k/ft}$$

$$M_a = \frac{1.28(16)^2}{8} = 41.0 \text{ ft·k}$$

Try a pipe 8 x-strong, which has a plastic section modulus, $Z_x = 31.0\ in^3$.

The yield strength, $F_y = 35\ ksi$

Compactness ratio: $\lambda = D/t = 18.5$

Determine the slender flange ratio limit from Table B4.1b: $\lambda_p = \frac{0.07E}{F_y} = \frac{0.07(29{,}000)}{35} = 58.0 > \lambda$ (Compact)

By observation, $\lambda < \frac{0.45E}{F_y}$, so Section F8 applies.

$$\lambda_p = 2.42\sqrt{\frac{E}{F_y}} = 2.42\sqrt{\frac{29{,}000}{46}} = 60.8 > \lambda$$

$$M_n = M_p = F_y \times Z_x = 35 \times 31.0 = 1{,}090 \text{ in-k} = 90.4 \text{ ft-k} \tag{F8-1}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(90.4) = 81.4\ ft·k$

ASD: $M_n / \Omega_b = {}^{90.4}/_{1.67} = 54.1\ ft·k$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	81.4	81.4	none	
M_n/Ω_b (ft·k) [ASD]	54.1	54.1	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 Pipe F.STD` is typically installed with the program.

V. AISC 360-10 WT Shape F.10

Verify the available flexural strength of a WT section per the LRFD and ASD methods of the AISC 360-10 code.

References

1. American Institute of Steel Construction. 2010 *Steel Construction Manual. Fourteenth Edition*. AISC: Chicago, IL.
2. American Institute of Steel Construction. 2011. *Design Examples, Version 14.0*. AISC:Chicago, IL. Example F10, pp. F44 - F46

Details

From reference (2):

> Select an ASTM A992 WT beam with a 5-in. nominal depth and a simple span of 6 ft. The toe of the stem of the WT is in tension. The loads are a uniform dead load of 0.08 kip/ft and a uniform live load of 0.24 kip/ft. There is no deflection limit for this member. The beam is continuously braced.

Validation

Ultimate moment:

$$w_u = 1.2(0.08\text{ k/ft}) + 1.6(0.24\text{ k/ft}) = 0.48\text{ k/ft}$$

$$M_u = \frac{0.48(6)^2}{8} = 2.16\text{ ft-k}$$

Service moment:

$$w_a = 0.08\text{ k/ft} + 0.24\text{ k/ft} = 0.32\text{ k/ft}$$

$$M_a = \frac{0.32(6)^2}{8} = 1.44\text{ ft-k}$$

Try a WT5×6, which has a plastic section modulus, $Z_x = 2.20\ in^3$ and a section modulus, $S_x = 1.22\ in^3$.

Flexural Yielding

$$M_n = M_p = F_y \times Z_x = 50 \times 2.20 = 110\text{ in}\cdot\text{k} < 1.6F_yS_x = 1.6 \times 50 \times 1.22 = 97.6\text{ in-k} \quad \text{(F9-2)}$$

Lateral-torsional buckling does not govern since the member is continuously braced.

Flange compactness: $\lambda = {}^{b_f}\!/_{2t_f} = 9.43$

Determine the compact and slender flange ratio limits from Table B4.1b:

$$\lambda_{pf} = 0.38\sqrt{\frac{E}{F_y}} = 0.38\sqrt{\frac{29{,}000}{46}} = 9.15$$

$$\lambda_{rf} = 1.0\sqrt{\frac{E}{F_y}} = 1.0\sqrt{\frac{29{,}000}{46}} = 24.1$$

Thus, the section has a non-compact flange.

$$M_n = \left[M_p - (M_p - 0.7F_yS_{xc})\left(\frac{\lambda - \lambda_{pf}}{\lambda_{rf} - \lambda_{pf}}\right)\right] = \ = \left[110 - (110 - 0.7 \times 50 \times 3.20)\left(\frac{9.43 - 9.15}{24.1 - 9.15}\right)\right] = 110 \text{ in}\cdot\text{k} >$$

So use $M_n = 97.6\ in \cdot k = 8.13\ ft \cdot k$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(8.13) = 7.32\ ft \cdot k$

ASD: $M_n / \Omega_b = {}^{8.13}/_{1.67} = 4.87\ ft \cdot k$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	7.32	7.21	1.5%	
M_n/Ω_b (ft·k) [ASD]	4.87	4.80	1.5%

V. AISC 360-10 Angle F.11A

Verify the available flexural strength of a single angle member per the AISC 360-10 code.

References

2. American Institute of Steel Construction. 2011. *Design Examples, Version 14.0*. AISC:Chicago, IL. Example Example F.11A, pp. F47-F49

Details

From reference (2):

> Select an ASTM A36 single angle with a simple span of 6 ft. The vertical leg of the single angle is up and the toe is in compression. The vertical loads are a uniform dead load of 0.05 kip/ft and a uniform live load of 0.15 kip/ft. There are no horizontal loads. There is no deflection limit for this angle. The angle is braced at the end points only. Assume bending about the geometric x-x axis and that there is no lateral-torsional restraint.

Note: The angle section is given a beta angle as the geometrical axis and principal axis are different. In STAAD.Pro the calculation is done with reference with the principal axis, but in AISC 360-10 Code geometrical axis is used calculating the capacities of the section.

Validation

Ultimate moment:

$$w_u = 1.2(0.05 \text{ k/ft}) + 1.6(0.15 \text{ k/ft}) = 0.30 \text{ k/ft}$$

$$M_u = \frac{0.30(6)^2}{8} = 1.35 \text{ ft} \cdot \text{k}$$

Service moment:

$$w_a = 0.05 \text{ k/ft} + 0.15 \text{ k/ft} = 0.20 \text{ k/ft}$$

$$M_a = \frac{0.2(6)^2}{8} = 0.90 \text{ ft} \cdot \text{k}$$

Try an L4×4×1/4, which has a section modulus, $S_x = 1.03\ in^3$.

The yield strength, $F_y = 36\ ksi$

The nominal flexural strength for the flexural yielding limit state:

$$M_n = 1.5M_y = 1.5F_yS_x = 1.5 \times 36 \times 1.03 = 55.6 \text{ in} \cdot \text{k} \qquad \text{(F10-1)}$$

The yield moment for a single angle bent about its geometric axis with no lateral-torsional restraint:

$$M_y = 0.8F_yS_x = 0.8 \times 36 \times 1.03 = 29.7 \text{ in} \cdot \text{k}$$

Determine M_e:

$$M_e = \frac{0.66Eb^4tC_b}{L_b^2}\left[\sqrt{1 + 0.78\left(\frac{L_bt}{b^2}\right)^2} - 1\right] \qquad \text{(F10-6a)}$$

where

C_b = 1.14 from Ref. 1, Table 3-1

$$M_e = \frac{0.66(29,\ 000)(4.0)^4(1/4)1.14}{(6 \times 12)^2}\left[\sqrt{1 + 0.78\left(\frac{6 \times 12(1/4)}{(4.0)^2}\right)^2} - 1\right] = 110 \text{ in}\cdot\text{k} > M_y$$

$$M_n = \left(1.92 - 1.17\sqrt{\frac{M_y}{M_e}}\right)M_y \le 1.5M_y \tag{F10-3}$$

$$M_n = \left(1.92 - 1.17\sqrt{\frac{29.7}{110}}\right)29.7 = 39.0 \text{ in}\cdot\text{k} \le 1.5(29.7) = 44.6 \text{ in}\cdot\text{k}$$

Leg local buckling

Leg slenderness ratio: $\lambda = \frac{b}{t} = \frac{4.0}{1/4} = 16.0$

Determine the compact and slender leg ratio limits from Table B4.1b:

$$\lambda_p = 0.54\sqrt{\frac{E}{F_y}} = 0.54\sqrt{\frac{29{,}000}{36}} = 15.3$$

$$\lambda_r = 0.91\sqrt{\frac{E}{F_y}} = 0.91\sqrt{\frac{29{,}000}{36}} = 25.8$$

$\lambda_p < \lambda < \lambda_r$; thus, the leg is non-compact in flexure.

$$M_n = F_y S_c\left[2.43 - 1.72\left(\frac{b}{t}\right)\sqrt{\frac{F_y}{E}}\right] \tag{F10-3}$$

where

S_c = $0.80S_x = 0.80 \times 1.03 = 0..824 \ in^3$

$$M_n = 36 \times 0.824\left[2.43 - 1.72(16.0)\sqrt{\frac{36}{29,\ 000}}\right] = 43.3 \text{ in}\cdot\text{k}$$

The lateral-torsional buckling limit state governs.

$$M_n = 43.3 \text{ in}\cdot\text{k} = 3.25 \text{ ft}\cdot\text{k}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(3.25) = 2.93$ *ft-k*

ASD: $M_n / \Omega_b = {}^{3.25}/_{1.67} = 1.95$ *ft-k*

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
LTB $\phi_b M_n$ (ft·k) [LRFD]	2.93	2.96	negligible	
LTB M_n/Ω_b (ft·k) [ASD]	1.95	1.97	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 Angle F.STD` is typically installed with the program.

V. AISC 360-10 W E.1C

Verify the compressive strength of an unbraced wide-flange section column about the Y-Y axis per the LRFD and ASD methods of the AISC 360-10 code.

Details

From the reference example E.1C:

Calculate the available strength of a W14×132 column with unbraced lengths of 30 ft in both axes.

From the reference example E.1A:

> … an ASTM A992 (Fy = 50 ksi) W-shape column to carry an axial dead load of 140 kips and live load of 420 kips. The column is 30 ft long and is pinned top and bottom in both axes.

See example E.1C in reference (2) for calculations.

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	892	893	negligible	
P_n / Ω_c (kips) [ASD]	598	594	negligible	
Slenderness ratio	95.7	95.792	negligible

V. AISC 360-10 W E.1D

Verify the compressive strength of a column torsionally braced at the midpoint in the weak axis per the LRFD and ASD methods of the AISC 360-10 code.

Details

From the reference example E.1C

Calculate the available strength of a W14×90 with a strong axis unbraced length of 30.0 ft and weak axis and torsional unbraced lengths of 15.0 ft.

From the reference example E.1A:

... an ASTM A992 (Fy = 50 ksi) W-shape column to carry an axial dead load of 140 kips and live load of 420 kips. The column is 30 ft long and is pinned top and bottom in both axes.

See example E.1D in reference (2) for calculations.

Results

Result Type	**Reference**	**STAAD.Pro**	**Difference**	**Comments**
$\phi_c P_n$ (kips) [LRFD]	927	927	none	
P_n/Ω_c (kips) [ASD]	617	617	none	
Slenderness ratio	58.6	58.63	negligible

Problem

From the reference:

Verify that a built-up, ASTM A572 Grade 50 column with PL 1 in. × 8 in. flanges and a PL 4 in. × 15 in. web is sufficient to carry a dead load of 70 kips and live load of 210 kips in axial compression. The column length is 15 ft and the ends are pinned in both axes.

Validation

Ultimate load:

$$P_u = 1.2(70\text{ kips}) + 1.6(210\text{ kips}) = 420\text{ kips}$$

Service load:

$$P_a = 70\text{ kips} + 210\text{ kips} = 280\text{ kips}$$

Section Properties

Built-up section properties (ignoring fillet welds):

$$A = 2(8.0)(1.0) + 15.0(0.25) = 19.8\text{ in}^2$$

$$I_x = \Sigma Ad^2 + \Sigma\frac{bh^3}{12} = 2\left[8(8.0)^2 + \frac{8.0(1.0)^3}{12}\right] + \frac{0.25(15.0)^3}{12} = 1,\ 100\text{ in}^4$$

$$I_y = 2\left(\frac{1.0 \times 8.0^3}{12}\right) + \frac{15.0 \times 0.25^3}{12} = 85.4\text{ in}^4$$

$$r_y = \sqrt{\frac{I_y}{A}} = \sqrt{\frac{85.4}{19.8}} = 2.08\text{ in}$$

Elastic Flexural Buckling Stress

Per Table C-A-7.1 in Reference 1, $K = 1.0$ for pinned-pinned columns. Since the unbraced length is the same both directions, by inspection the y-y axis governs.

$$\frac{KL}{r_y} = \frac{1.0(15.0)(12)}{2.08} = 86.5$$

$$F_e = \frac{\pi^2 E}{(KL\ /r)^2} = \frac{\pi^2 29,\ 000}{(86.5)^2} = 38.3\text{ ksi} \qquad \text{(Eq. E3-4)}$$

<u>Slenderness</u>

Check for slender flanges and then determine the unstiffened element (flange) reduction factor.

$$k_c = \frac{4}{\sqrt{h / t_w}} = \frac{4}{\sqrt{15.0 / 0.25}} = 0.516$$ (Table B4.1b note a)

$0.35 < k_c < 0.76$

Flange slenderness:

$$\lambda = \frac{b}{t} = \frac{4.0}{1.0} = 4.0$$

The limiting flange slenderness ratio, λ_r:

$$\lambda_r = 0.64\sqrt{\frac{k_c E}{F_y}} = 0.64\sqrt{\frac{0.516(29,\ 000)}{50}} = 11.1 > \lambda$$ (Table B4.1a, case 2)

Thus, the flanges are not slender and there is no reduction ($Q_s = 1.0$).

Check for slender web and then determine the stiffened element (web) reduction factor.

Web slenderness:

$$\lambda = \frac{h}{t} = \frac{15.0}{0.25} = 60.0$$

The limiting web slenderness ratio, λ_r:

$$\lambda_r = 1.49\sqrt{\frac{E}{F_y}} = 1.49\sqrt{\frac{29,\ 000}{50}} = 35.9 < \lambda$$ (Table B4.1a, case 5)

Thus, the web is slender.

$$Q_a = \frac{A_e}{A_g}$$ (Eq. E7-16)

where

A_e	=	the effective area based on the reduced effective width, b_e
b_e	=	$1.92t\sqrt{\frac{E}{f}}\left[1 - \frac{0.34}{(b / t)}\sqrt{\frac{E}{f}}\right] \leq b$ (Eq. E7-17)
f	=	F_{cr} calculated based on $Q = 1.0$
F_{cr}	=	$Q\left(0.658^{QF_y/F_e}\right)F_y = 1.0\left[0.658^{1.0(50)/(38.3)}\right]50 = 29.0\ ksi$ because $\frac{KL}{r} = 86.5 < 4.71\sqrt{\frac{E}{QF_y}} = 4.71\sqrt{\frac{29,\ 000}{1.0(50)}} = 113$

$$b_e = 1.92(0.25)\sqrt{\frac{29,\ 000}{29.0}}\left[1 - \frac{0.34}{(15 / 0.25)}\sqrt{\frac{29,\ 000}{29.0}}\right] = 12.5 \text{ in} < 15 \text{ in}$$

$$A_e = b_e t_w + 2b_f t_f = 12.5(0.25) + 2(8.0)(1.0) = 19.1 \text{ in}^2$$

$$Q_a = \frac{19.1}{19.8} = 0.965$$

$$Q = Q_s Q_a = 1.0 \times 0.965 = 0.965$$

$$\frac{KL}{r} = 86.5 < 4.71\sqrt{\frac{E}{QF_y}} = 4.71\sqrt{\frac{29,\ 000}{0.965(50)}} = 115$$

$$F_{cr} = Q\left(0.658^{QF_y/F_e}\right)F_y = 0.965\left[0.658^{0.965(50)/(38.3)}\right]50 = 28.5 \text{ ksi}$$

<u>Nominal Compressive Strength</u>

$$P_n = F_{cr}A_g = 28.5(19.8) = 564 \text{ kips} \qquad \text{(Eq E7-1)}$$

The available compressive strength:

LRFD: $\phi_c P_n = 0.90(564) = 508 \; kips$

ASD: $P_n / \Omega_c = {}^{564}/_{1.67} = 338 \; kips$

Comparison

Table 749: Comparison of results

Result Type	Reference	STAAD.Pro	Difference
$\phi_c P_n$ (kips) [LRFD]	508	513	1.0%
P_n/Ω_c (kips) [ASD]	338	341	0.9%

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\ Verification Models\09 Steel Design\US\AISC\AISC 360-10 - E-2.STD` is typically installed with the program.

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

V. AISC 360-10 Built up I E.3

Verify the compressive strength of a built-up I section with slender flanges per the LRFD and ASD methods of the AISC 360-10 code.

Details

From reference (2):

Determine if a built-up, ASTM A572 Grade 50 column with PL3/8 in. × 102 in. flanges and a PL1/4 in. × 74 in. web has sufficient available strength to carry a dead load of 40 kips and a live load of 120 kips in axial compression. The column's unbraced length is 15.0 ft in both axes and the ends are pinned.

Validation

Ultimate load:

$$P_u = 1.2(40 \text{ kips}) + 1.6(120 \text{ kips}) = 240 \text{ kips}$$

Service load:

$$P_a = 40 \text{ kips} + 120 \text{ kips} = 160 \text{ kips}$$

Section Properties

Built-up section properties (ignoring fillet welds):

$$A_g = 2(10.5)(0.375) + 7.25(0.25) = 9.69 \text{ in}^2$$

$$I_x = \Sigma Ad^2 + \Sigma\frac{bh^3}{12} = 2\left[10.5 \times 0.375(3.81)^2 + \frac{10.5(0.25)^3}{12}\right] + \frac{0.25(7.25)^3}{12} = 122 \text{ in}^4$$

$$I_y = 2\left(\frac{0.375 \times 10.5^3}{12}\right) + \frac{7.25 \times 0.25^3}{12} = 72.4 \text{ in}^4$$

$$r_y = \sqrt{\frac{I_y}{A}} = \sqrt{\frac{72.4}{9.69}} = 2.73 \text{ in}$$

From the User Note in Section E4 of Reference 1:

$$C_w = \frac{I_y h_o^2}{4} = \frac{72.4(7.63)^2}{4} = 1,\ 050 \text{ in}^6$$

From Eq. 3.4 in Reference 3:

$$J = \Sigma\frac{bt^3}{3} = \frac{2(10.5)(0.375)^3 + 7.25(0.25)^3}{3} = 0.407 \text{ in}^4$$

Slenderness

Check for slender web and then determine the stiffened element (web) reduction factor.

Web slenderness:

$$\lambda = \frac{h}{t} = \frac{7.25}{0.25} = 29.0$$

The limiting web slenderness ratio, λ_r:

$$\lambda_r = 1.49\sqrt{\frac{E}{F_y}} = 1.49\sqrt{\frac{29,\ 000}{50}} = 35.9 > \lambda$$ (Table B4.1a, case 5)

Thus, the web is not slender and there is no reduction (i.e., Q_a *1.0)*

Check for slender flanges and then determine the unstiffened element (flange) reduction factor.

$$k_c = \frac{4}{\sqrt{h\ /t_w}} = \frac{4}{\sqrt{7.25\,/\,0.25}} = 0.743$$ (Table B4.1b note a)

$0.35 < k_c < 0.76$, OK.

Flange slenderness:

$$\lambda = \frac{b}{t} = \frac{5.25}{0.375} = 14.0$$

The limiting flange slenderness ratio, λ_r:

$$\lambda_r = 0.64\sqrt{\frac{k_c E}{F_y}} = 0.64\sqrt{\frac{0.743(29,\ 000)}{50}} = 13.3 < \lambda$$ (Table B4.1a, case 2)

Thus, the flanges are slender.

$$0.64\sqrt{\frac{k_c E}{F_y}} = 13.3 < \frac{b}{t} = 14.0 < 1.17\sqrt{\frac{k_c E}{F_y}} = 1.17\sqrt{\frac{0.743(29,\ 000)}{50}} = 24.3$$

$$Q_s = 1.415 - 0.65\left(\frac{b}{t}\right)\sqrt{\frac{F_y}{k_c E}} = 1.415 - 0.65(14.0)\sqrt{\frac{50}{0.743(29,\ 000)}} = 0.977$$ (Eq. E7-8)

$$Q = Q_s Q_a = 0.977(1.0) = 0.977$$

<u>Elastic Flexural Buckling Stress</u>

Per Table C-A-7.1 in Reference 1, $K = 1.0$ for pinned-pinned columns. Since the unbraced length is the same both directions, by inspection the y-y axis governs.

$$\frac{K_y L}{r_y} = \frac{1.0(15.0)(12)}{2.73} = 65.9$$

$$F_e = \frac{\pi^2 E}{(KL\ \ /\,r)^2} = \frac{\pi^2 29,\ 000}{(65.9)^2} = 65.9 \text{ ksi}$$ (Eq. E3-4)

<u>Nominal Compressive Strength</u>

$$\frac{KL}{r} = 65.9 < 4.71\sqrt{\frac{E}{QF_y}} = 4.71\sqrt{\frac{29,\ 000}{0.977(50)}} = 115$$

$$F_{cr} = Q\left(0.658^{QF_y/F_e}\right)F_y = 0.977\left[0.658^{0.977(50)/(65.9)}\right]50 = 35.8 \text{ ksi}$$ (Eq E7-2)

$$P_n = F_{cr} A_g = 35.8(6.69) = 347 \text{ kips}$$ (Eq E7-1)

The available compressive strength:

LRFD: $\phi_c P_n = 0.90(347) = 312$ *kips*

ASD: $P_n / \Omega_c = {}^{347}/_{1.67} = 208\ kips$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	312	314	negligible	
P_n / Ω_c (kips) [ASD]	208	209	negligible	
Slenderness ratio	65.9	65.86	negligible

V. AISC 360-10 Double L E.5

Reference

American Institute of Steel Construction. 2011. *Design Examples, Version 14.0*. AISC:Chicago, IL. Example E5, pp. E-26 - E-30.

Note: This reference is freely available for download from the AISC website at https://www.aisc.org/globalassets/aisc/university-programs/teaching-aids/first-semester-design-examples.pdf

Related Links
- *D1.A.5.2 Axial Compression* (on page 1093)

Problem

From the reference:

> Verify the strength of a 2L 4×3-1/2×3/8 LLBB (3/8-in. separation) strut, ASTM A36, with a length of 8 ft and pinned ends carrying an axial dead load of 20 kips and live load of 60 kips.

Refer to the reference for calculations.

Comparison

Table 750: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	128	127	negligible	
P_n/Ω_c (kips) [ASD]	85.0	84.6	negligible	

Note: STAAD.Pro does *not* perform design per Section E6 of the specification. It is assumed that sufficient intermediate connectors of an appropriate type are present. It is left to the engineer to verify the intermediate connector design.

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\360-2010\AISC 360-10 - E.STD` is typically installed with the program.

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

V. AISC 360-10 Double L E.6

Verify the compressive strength of an unbraced wide-flange section column about the Y-Y axis per the LRFD and ASD methods of the AISC 360-10 code.

Details

From the reference example E.1C:

Determine if a 2L5×3×1/4 LLBB (3/4-in. separation) strut, ASTM A36, with a length of 8 ft and pinned ends has sufficient available strength to support a dead load of 10 kips and live load of 30 kips in axial compression. Also, calculate the required number of pretensioned bolted or welded intermediate connectors.

Validation

Ultimate load:

$$P_u = 1.2(10\text{ kips}) + 1.6(30\text{ kips}) = 60\text{ kips}$$

Service load:

$$P_a = 10\text{ kips} + 30\text{ kips} = 40\text{ kips}$$

Per Table C-A-7.1 in Reference 1, $K = 1.0$ for pinned-pinned columns. Since the unbraced length is the same both directions, by inspection the y-y axis governs.

Slenderness

$$\lambda = \frac{b}{t} = \frac{5.0}{0.25} = 20.0$$

The limiting slenderness ratio, λ_r:

$$\lambda_r = 0.45\sqrt{\frac{E}{F_y}} = 0.45\sqrt{\frac{29,000}{36}} = 12.8 < \lambda \qquad \text{(Table B4.1a, case 3)}$$

Thus, the outstanding legs are slender.

Check for slender web and then determine the stiffened element (web) reduction factor.

$$0.45\sqrt{\frac{E}{F_y}} = 12.8 < \frac{b}{t} = 20.0 < 0.91\sqrt{\frac{E}{F_y}} = 0.91\sqrt{\frac{29,000}{36}} = 25.8$$

$$Q_s = 1.34 - 0.76\left(\frac{b}{t}\right)\sqrt{\frac{F_y}{E}} = 1.34 - 0.76(20.0)\sqrt{\frac{36}{29,000}} = 0.804 \qquad \text{(Eq. E7-11)}$$

$$Q = Q_s Q_a = 0.804(1.0) = 0.804$$

$$F_{cr} = Q\left(0.658^{QF_y/F_e}\right)F_y$$

where

F_e	=	$\left(\frac{F_{ey} + F_{ez}}{2H}\right)\left[1 - \sqrt{1 - \frac{4F_{ey}F_{ez}H}{(F_{ey} + F_{ez})^2}}\right]$ (Eq E4-5)
K_i	=	0.5 for angles back-to-back
r_i	=	$r_z = 0.652$ in; the radius of gyration for a single angle
a	=	32 in spacing between connectors (using the bolts at 1/3 points from Reference 2)
$\left(\frac{K_y L}{r_y}\right)_m$	=	$\sqrt{\left(\frac{KL}{r}\right)_0^2 + \left(\frac{K_i a}{r_i}\right)^2} = \sqrt{\left(\frac{1.0 \times 96}{1.33}\right)^2 + \left(\frac{0.5 \times 32}{0.652}\right)^2} = 76.3$ for $\frac{a}{r_i} = \frac{32\ in}{0.652\ in} = 49.1 > 40$
F_{ey}	=	$\frac{\pi^2 E}{\left(\frac{K_y L}{r_y}\right)_m^2} = \frac{\pi^2(29,\ 000)}{(76.3)^2} = 49.2\ ksi$
F_{ez}	=	$\frac{GJ}{A_g \bar{r}_0^2} = \frac{11,\ 200(0.04328) \times 2\ angles}{3.88(2.59)^2} = 37.7\ ksi$

Thus, $\left(\frac{49.2 + 37.7}{2 \times 0.657}\right)\left[1 - \sqrt{1 - \frac{4(49.2)(37.7)(0.657)}{(49.2 + 37.7)^2}}\right] = 26.8\ ksi$

Nominal Compressive Strength

$$\frac{QF_y}{2.25} = \frac{0.804(36)}{2.25} = 12.9 \text{ ksi} < 26.8 \text{ ksi}$$

$$F_{cr} = Q\left(0.658^{QF_y/F_e}\right)F_y = 0.804\left[0.658^{0.804(36)/(26.8)}\right]36 = 18.4 \text{ ksi} \qquad \text{(Eq E7-2)}$$

$$P_n = F_{cr}A_g = 18.4(3.88) = 71.4 \text{ kips} \qquad \text{(Eq E7-1)}$$

The available compressive strength:

LRFD: $\phi_c P_n = 0.90(71.4) = 64.3\ kips$

ASD: $P_n / \Omega_c = {}^{71.4}/_{1.67} = 42.8\ kips$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	64.3	63.8	negligible	
P_n/Ω_c (kips) [ASD]	42.8	42.4	negligible	

Note: STAAD.Pro does *not* perform design per Section E6 of the specification. It is assumed that sufficient intermediate connectors of an appropriate type are present. It is left to the engineer to verify the intermediate connector design.

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 Double L E.STD` is typically installed with the program.

V. AISC 360-10 WT E.7

Verify the compressive strength of a WT section per the LRFD and ADS methods of the AISC 360-10 codes.

Details

From reference (2):

> Select an ASTM A992 nonslender WT-shape compression member with a length of 20 ft to support a dead load of 20 kips and live load of 60 kips in axial compression. The ends are pinned.

See example E.7 in reference (2) for calculations.

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	128	127	negligible	
P_n / Ω_c (kips) [ASD]	85.0	84.3	negligible

V. AISC 360-10 Rect HSS E.9

Verify the compressive strength of an unbraced column with a rectangular HSS section per the LRFD and ASD methods of the AISC 360-10 code.

Details

From reference (2):

> Select an ASTM A500 Grade B rectangular HSS compression member, with a length of 20 ft, to support a dead load of 85 kips and live load of 255 kips in axial compression. The base is fixed and the top is pinned.

Validation

Ultimate load:

$$P_u = 1.2(85\text{ kips}) + 1.6(255\text{ kips}) = 510\text{ kips}$$

Service load:

$$P_a = 85\text{ kips} + 255\text{ kips} = 340\text{ kips}$$

Slenderness

Note: The corner radius is taken as 1.5× the design wall thickness per Section B4.1b of Reference 1.

$$\lambda = \frac{h}{t} = \frac{12.0 - 3(0.349)}{0.349} = 31.4$$

The limiting slenderness ratio, λ_r:

$$\lambda_r = 1.40\sqrt{\frac{E}{F_y}} = 1.40\sqrt{\frac{29,\,000}{46}} = 35.2 > \lambda \qquad \text{(Table B4.1a, case 3)}$$

Thus, the section does not contain slender elements.

Per Table C-A-7.1 in Reference 1, $K = 0.8$ for fixed-pinned columns. Since the unbraced length is the same both directions, by inspection the y-y axis governs.

$$\frac{K_y L}{r_y} = \frac{0.8(20)(12)}{4.01} = 47.9 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,\,000}{46}} = 118$$

$$F_e = \frac{\pi^2 E}{\left(\frac{K_y L}{r_y}\right)_m^2} = \frac{\pi^2(29,\,000)}{(47.9)^2} = 125\text{ ksi} \qquad \text{(Eq. E3-4)}$$

$$F_{cr} = \left(0.658^{F_y/F_e}\right)F_y = (0.658^{46/125})46 = 39.4\text{ ksi} \qquad \text{(Eq. E3-2)}$$

Nominal Compressive Strength

$$P_n = F_{cr}A_g = 39.4(14.6) = 575\text{ kips} \qquad \text{(Eq E7-1)}$$

The available compressive strength:

LRFD: $\phi_c P_n = 0.90(575) = 518\ kips$

ASD: $P_n / \Omega_c = {}^{575}\!/_{1.67} = 344\ kips$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	518	518	none	
P_n/Ω_c (kips) [ASD]	344	345	negligible

V. AISC 360-10 Pipe E.11

Verify the compressive strength of a pipe section braced at the midpoint in the Y-Y direction per the LRFD and ADS methods of the AISC 360-10 codes.

Details

From reference (2):

> Select an ASTM A53 Grade B Pipe compression member with a length of 30 ft to support a dead load of 35 kips and live load of 105 kips in axial compression. The column is pin-connected at the ends in both axes and braced at the midpoint in the y-y direction.

Validation

Ultimate load:

$$P_u = 1.2(35 \text{ kips}) + 1.6(105 \text{ kips}) = 210 \text{ kips}$$

Service load:

$$P_a = 35 \text{ kips} + 105 \text{ kips} = 140 \text{ kips}$$

Per Table C-A-7.1 in Reference 1, $K = 1.0$ for pinned-pinned columns.

$$\left(\frac{KL}{r}\right)_x = \frac{1.0 \times 30 \times 12}{3.68} = 97.8$$

$$\left(\frac{KL}{r}\right)_y = \frac{1.0 \times 15 \times 12}{3.68} = 48.9$$

So buckling about the x-x axis governs. For 35 ksi, no pipe sections are slender per Table 4-6 in Reference 1.

$$\left(\frac{KL}{r}\right)_{max} = 97.8 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,\ 000}{35}} = 136$$

The critical stress

$$F_e = \frac{\pi^2 E}{\left(\frac{KL}{r}\right)^2} = \frac{\pi^2 29,\ 000}{(97.8)^2} = 29.9 \text{ ksi} \quad \text{(Eq. E3-4)}$$

Nominal Compressive Strength

$$F_{cr} = \left(0.658^{F_y/F_e}\right) F_y = 0.804\left[0.658^{35/29.9}\right]35 = 21.4 \text{ ksi} \quad \text{(Eq E7-2)}$$

$$P_n = F_{cr} A_g = 21.4(11.5) = 246 \text{ kips} \quad \text{(Eq E7-1)}$$

The available compressive strength:

LRFD: $\phi_c P_n = 0.90(246) = 221 \ kips$

ASD: $P_n / \Omega_c = {}^{246}/_{1.67} = 147 \ kips$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	221	219	negligible	
P_n / Ω_c (kips) [ASD]	147	145	negligible

V. AISC 360-10 Built Up I E 12

Verify the compressive strength of a built-up I section with different flange widths per the LRFD and ADS methods of the AISC 360-10 codes.

Details

From reference (2):

> Compute the available strength of a built-up compression member with a length of 14 ft. The ends are pinned. The outside flange is PL3/4-in.×5-in., the inside flange is PL3/4-in.×8-in., and the web is PL3/8-in.×10 1/2-in. Material is ASTM A572 Grade 50.

Validation

Material Properties

$$F_y = 50 \text{ ksi}$$

$$F_u = 65 \text{ ksi}$$

Section Properties

Built-up section properties (ignoring fillet welds):

$$A_g = 8.0(0.75) + 10.5(0.375) + 5.0(0.75) = 13.7 \text{ in}^2$$

$$\bar{y} = \frac{\Sigma A_i y_i}{\Sigma A_i} = \frac{6.0(11.6) + 3.94(6.0) + 3.75(0.375)}{6.0 + 3.94 + 3.75} = 6.91 \text{ in}$$

where $\bar{y}$ is measured from the bottom of the outside flange.

$$I_x = \left[8.0(0.75)(4.72)^2 + \frac{8.0(0.75)^3}{12}\right] + \left[0.375(10.5)(0.910)^2 + \frac{0.375(10.5)^3}{12}\right] + \left[5.0(0.75)(6.54)^2 + \frac{5.0(0.75)^3}{12}\right] =$$

$$I_y = \frac{0.75 \times 8.0^3}{12} + \frac{10.5 \times 0.375^3}{12} + \frac{0.75 \times 5.0^3}{12} = 39.9 \text{ in}^4$$

$$r_x = \sqrt{\frac{I_x}{A}} = \sqrt{\frac{334}{13.7}} = 4.94 \text{ in}$$

$$r_y = \sqrt{\frac{I_y}{A}} = \sqrt{\frac{39.9}{13.7}} = 1.71 \text{ in}$$

From Eq. 3.4 in Reference 3:

$$J = \Sigma\frac{bt^3}{3} = \frac{8.0(0.75)^3 + 10.5(0.375)^3 + 5.0(0.75)^3}{3} = 2.01 \text{ in}^4$$

Distance between flange centroids:

$$h_0 = 12.0 - \frac{0.75}{2} - \frac{0.75}{2} = 11.3 \text{ in}$$

$$C_w = \frac{t_f h_o^2}{12}\left(\frac{b_1^3 b_2^3}{b_1^3 + b_2^3}\right) = \frac{0.75(11.3)^2}{12}\left[\frac{(8.0)^3(5.0)^3}{(8.0)^3 + (5.0)^3}\right] = 802 \text{ in}^6$$

Due to symmetry about the y-axis, the shear center lies on the y axis ($x_0 = 0$). The distance from the centroid to the shear center can be calculated by finding the shear center from outside flange plus one-half the outside flange and then subtracting the centroid distance from that same reference point.

$$y_0 = \left(e + \frac{t_f}{2}\right) - \bar{y} = h_0\left[\frac{b_1^3}{b_1^3 + b_2^3}\right] + \frac{t_f}{2} - \bar{y} = 11.3\left[\frac{(8.0)^3}{(8.0)^3 + (5.0)^3}\right] + \frac{0.75}{2} - 6.91 = 2.55 \text{ in}$$

$$\bar{r}_0^2 = x_0^2 + y_0^2 + \frac{I_x + I_y}{A_g} = 0 + (2.55)^2 + \frac{344 + 39.9}{13.7} = 33.8 \text{ in}^2$$

$$H = 1 - \frac{x_0^2 + y_0^2}{\bar{r}_0^2} = 1 - \frac{0 + (2.55)^2}{33.8} = 0.808$$

<u>Elastic Flexural Buckling Stress</u>

Per Table C-A-7.1 in Reference 1, $K = 1.0$ for pinned-pinned columns. Since the unbraced length is the same both directions, by inspection the y-y axis governs.

$$\frac{K_y L}{r_y} = \frac{1.0(14.0)(12)}{1.71} = 98.2$$

$$F_{ey} = \frac{\pi^2 E}{(KL\ /r_y)^2} = \frac{\pi^2 29,\ 000}{(98.2)^2} = 29.7 \text{ ksi} \quad \text{(Eq. E4-8)}$$

$$F_{ez} = \left[\frac{\pi^2 E C_w}{(K_z L\ )^2} + GJ\right]\left(\frac{1}{A_g \bar{r}_0^2}\right) = \left[\frac{\pi^2(29,\ 000)(802)}{(1.0 \times 14.0 \times 12^2} + 11,\ 200(2.01)\right]\left(\frac{1}{13.7 \times 33.8}\right) = 66.2 \text{ ksi} \quad \text{(Eq. E4-9)}$$

$$F_e = \left(\frac{F_{ey} + F_{ez}}{2H}\right)\left[1 - \sqrt{1 - \frac{4F_{ey}F_{ez}H}{(F_{ey} + F_{ez})^2}}\right] = \left(\frac{29.7 + 66.2}{2 \times 0.808}\right)\left[1 - \sqrt{1 - \frac{4(29.7)(66.2)(0.808)}{(29.7 + 66.2)^2}}\right] = 26.4 \text{ ksi} \quad \text{(Eq. E4-5)}$$

<u>Nominal Compressive Strength</u>

$$\frac{F_y}{2.25} = \frac{50}{2.25} = 22.2 \text{ ksi} < 26.4 \text{ ksi}$$

$$F_{cr} = \left(0.658^{F_y/F_e}\right)F_y = \left[0.658^{(50)/(26.4)}\right]50 = 22.6 \text{ ksi} \quad \text{(Eq E7-2)}$$

$$P_n = F_{cr}A_g = 22.6(13.7) = 310 \text{ kips} \quad \text{(Eq E7-1)}$$

The available compressive strength:

LRFD: $\phi_c P_n = 0.90(310) = 279 \text{ kips}$

ASD: $P_n / \Omega_c = {}^{310}\!/_{1.67} = 186 \text{ kips}$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	279	278	negligible	
P_n/Ω_c (kips) [ASD]	186	185	negligible
