V. AISC 360-10 - H.1B

Reference

Design Examples, Version 14.0, American Institute of Steel Construction, 2011, page H-4.

Note: This reference is freely available for download from the AISC website at https://www.aisc.org/globalassets/aisc/university-programs/teaching-aids/first-semester-design-examples.pdf

Related Links

- *D1.A.5.5 Design for Combined Forces* (on page 1096)

Objective

From the reference:

> Using AISC Manual tables to determine the available compressive and flexural strengths, determine if an ASTM A992 W14×99 has sufficient available strength to support the axial forces and moments listed as follows, obtained from a second-order analysis that includes P-δ effects. The unbraced length is 14 ft and the member has pinned ends. KLx = KLy = Lb = 14.0 ft.

Refer to the reference for calculations.

Note: A static analysis is used in STAAD.Pro as the reference supplies only the resulting forces from an assumed P-δ analysis.

Comparison

Table 751: Comparison of results

Result Type		Reference	STAAD.Pro	Difference
LRFD	Interaction Ratio	0.928	0.929	none
	ϕM_{nx} (kip-ft)	642	642	none
	ϕM_{ny} (kip-ft)	311	311	none
	$\phi_c P_n$ (kips)	1,130	1,130	none
ASD	Interaction Ratio	0.931	0.932	negligible
	M_{nx}/Ω (kip-ft)	428	427	negligible
	M_{ny}/Ω (kip-ft)	207	207	none
	Compression (kips)	750	750	none

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 - H.STD` is typically installed with the program.

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

V. AISC 360-10 W Tens BM H3

Verify the interaction checks due to tension and bending moments in both axes of a W section per the LRFD and ASD methods of the AISC 360-10 code.

Details

From reference (2):

> Select an ASTM A992 W-shape with a 14-in. nominal depth to carry forces of 29.0 kips from dead load and 87.0 kips from live load in axial tension, as well as the following moments due to uniformly distributed loads:
>
> MxD = 32.0 kip-ft
> MxL = 96.0 kip-ft

MyD = 11.3 kip-ft
MyL = 33.8 kip-ft

The unbraced length is 30.0 ft and the ends are pinned. Assume the connections are made with no holes.

See example H.3 in reference (2) for calculations.

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
Interaction ratio per H1-1b [LRFD]	0.873	0.874	negligible	
Interaction ratio per H1-1b [ASD]	0.874	0.876	negligible

V. AISC 360-10 HSST Torsional Strength H.5A

Verify the torsional strength of an rectangular HSS section per the LRFD and ASD methods of the AISC 360-10 code.

Details

From reference (2):

Determine the available torsional strength of an ASTM A500 Grade B HSS6×4×1/4.

Validation

$h/t > b/t$, so h/t governs.

$$\frac{h}{t} = 22.8 < 2.45\sqrt{\frac{E}{F_y}} = 2.45\sqrt{\frac{29,\ 000}{46}} = 61.5$$

$$F_{cr} = 0.6F_y = 0.6(46) = 27.6\ \text{ksi} \qquad \text{(Eq. H3-3)}$$

Nominal Torsional Strength

$$T_n = F_{cr}C = 27.6(10.1) = 279\ \text{in}\cdot\text{k} \qquad \text{(Eq. G2-1)}$$

The available shear strength:

LRFD: $\phi_T T_n = 0.90(279) = 251\ in\cdot k$

ASD: $T_n / \Omega_T = {}^{279}\!/_{1.67} = 167\ in\cdot k$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_G T_n$ (in·k) [LRFD]	251	251	none	
G_n/Ω_T (in·k) [ASD]	167	167	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 HSST Torsional Strength H.STD` is typically installed with the program.

V. AISC 360-10 HSSP Torsional Strength H.5B

Verify the torsional strength of an round HSS section per the LRFD and ASD methods of the AISC 360-10 code.

Details

From reference (2):

Determine the available torsional strength of an ASTM A500 Grade B HSS5.000×0.250 that is 14 ft long.

Validation

Critical Stress

$$F_{cr} = \max \left| \begin{array}{l} \dfrac{1.23E}{\sqrt{\dfrac{L}{D}}\left(\dfrac{D}{t}\right)^{5/4}} = \dfrac{1.23(29,\ 000)}{\sqrt{\dfrac{14 \times 12}{5.0}}(21.5)^{5/4}} = 133 \text{ ksi} \\ \dfrac{0.60E}{\left(D/t\right)^{3/2}} = \dfrac{0.60(29,\ 000)}{(21.5)^{3/2}} = 175 \text{ ksi} \end{array} \right.$$

The maximum permitted value is $F_{cr} \leq 0.6F_y = 0.6(42) = 25.2\ ksi$ (governs).

Nominal Torsional Strength

$$T_n = F_{cr}C = 25.2(7.95) = 200 \text{ in}\cdot\text{k} \qquad \text{(Eq. G2-1)}$$

The available shear strength:

LRFD: $\phi_T T_n = 0.90(200) = 180\ in \cdot k$

ASD: $T_n / \Omega_T = {}^{200}/_{1.67} = 120\ in \cdot k$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_G T_n$ (in·k) [LRFD]	180	180	none	
G_n/Ω_T (in·k) [ASD]	120	120	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 HSSP Torsional Strength H.STD` is typically installed with the program.

V. AISC 360-10 W Shape Strong Axis Shear G.1

Verify the available shear strength along the strong axis of a wide flange section per the LRFD and ASD methods of the AISD 360-10 code.

Details

From reference (2):

> Determine the available shear strength and adequacy of a W24×62 ASTM A992 beam ... with end shears of 48 kips from dead load and 145 kips from live load.

See example G.1A and G.1B in reference (2) for calculations.

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	306	306	none	
V_n / Ω_v (kips) [ASD]	204	204	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 W Shape Strong Axis Shear G.STD` is typically installed with the program.

V. AISC 360-10 C Strong Axis Shear G.2

Verify the available shear strength along the strong axis of a channel section per the LRFD and ASD methods of the AISD 360-10 code.

Details

From reference (2):

> Verify the available shear strength and adequacy of a C15×33.9 ASTM A36 channel with end shears of 17.5 kips from dead load and 52.5 kips from live load.

See example G.2A and G.2B in reference (2) for calculations.

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	117	117	none	
V_n / Ω_v (kips) [ASD]	77.8	77.6	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 C Strong Axis Shear G.STD` is typically installed with the program.

V. AISC 360-10 L Shear Capacity G.3

Verify the available shear strength along the strong axis of a single angle section per the LRFD and ASD methods of the AISD 360-10 code.

Details

From reference (2):

Determine the available shear strength and adequacy of a L5×3×1/4 (LLV) ASTM A36 with end shears of 3.50 kips from dead load and 10.5 kips from live load.

Validation

Ultimate load:

$$V_u = 1.2(3.50 \text{ kips}) + 1.6(10.5 \text{ kips}) = 21.0 \text{ kips}$$

Service load:

$$V_a = 3.50 \text{ kips} + 10.5 \text{ kips} = 14.0 \text{ kips}$$

Area of the web for shear:

$$A_w = bt = 5.0(0.25) = 1.25 \text{ in}^2$$

Section G4 of Reference 1 gives $k_v = 1.2$.

$$\frac{h}{t_w} = \frac{b}{t} = \frac{5.0}{0.25} = 20 < 1.10\sqrt{\frac{k_v E}{F_y}} = 1.10\sqrt{\frac{1.2(29,\ 000)}{36}} = 34.2$$

Therefore, $C_v = 1.0$.

<u>Nominal Shear Strength</u>

$$V_n = 0.6F_y A_w C_v = 0.6(36)(1.25)(1.0) = 27.0 \text{ kips} \qquad \text{(Eq. G2-1)}$$

The available shear strength:

LRFD: $\phi_v V_n = 0.90(27.0) = 24.3 \text{ kips}$

ASD: $V_n / \Omega_v = {}^{27.0}\!/_{1.67} = 16.2\ kips$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	24.3	24.3	none	
V_n / Ω_v (kips) [ASD]	16.2	16.2	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 L Shear Capacity G.STD` is typically installed with the program.

V. AISC 360-10 HSST Shear Capacity G.4

Verify the available shear strength along the strong axis of a rectangular HSS section per the LRFD and ASD methods of the AISD 360-10 code.

Details

From reference (2):

> Determine the available shear strength and adequacy of an HSS6×4×3/8 ASTM A500 Grade B member with end shears of 11.0 kips from dead load and 33.0 kips from live load. The beam is oriented with the shear parallel to the 6 in. dimension.

Validation

Ultimate load:

$$V_u = 1.2(11.0\text{ kips}) + 1.6(33.0\text{ kips}) = 66.0\text{ kips}$$

Service load:

$$V_a = 11.0\text{ kips} + 33.0\text{ kips} = 44.0\text{ kips}$$

Area of the web for shear:

Note: The corner radius is taken as 1.5× the design wall thickness per Section B4.1b of Reference 1.

$$h = H - 3t = 6.0 - 3\times 0.349 = 4.95\text{ in}$$

Section G5 of Reference 1 gives $k_v = 5$.

$$A_w = 2ht = 2(4.95)(0.349) = 3.46\text{ in}^2$$

$$\frac{h}{t_w} = \frac{4.95}{0.349} = 14.2 < 1.10\sqrt{\frac{k_v E}{F_y}} = 1.10\sqrt{\frac{5(29,\ 000)}{46}} = 61.8$$

Therefore, $C_v = 1.0$.

Nominal Shear Strength

$$V_n = 0.6F_y A_w C_v = 0.6(46)(3.46)(1.0) = 95.5\text{ kips} \qquad \text{(Eq. G2-1)}$$

The available shear strength:

LRFD: $\phi_v V_n = 0.90(95.5) = 86.0\ kips$

ASD: $V_n / \Omega_v = {}^{95.5}\!/_{1.67} = 57.2\ kips$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	86.0	85.9	negligible	
V_n/Ω_v (kips) [ASD]	57.2	57.1	negligible

V. AISC 360-10 HSSP Shear Capacity G.5

Verify the available shear strength along the strong axis of a round HSS section per the LRFD and ASD methods of the AISD 360-10 code.

Details

From reference (2):

> Verify the available shear strength and adequacy of a round HSS16.000×0.375 ASTM A500 Grade B member spanning 32 ft with end shears of 30.0 kips from dead load and 90.0 kips from live load.

Validation

Ultimate load:

$$V_u = 1.2(30.0\text{ kips}) + 1.6(90.0\text{ kips}) = 180\text{ kips}$$

Service load:

$$V_a = 30.0\text{ kips} + 90.0\text{ kips} = 120\text{ kips}$$

Shear Buckling Stress

$$F_{cr} = \max\begin{cases} \dfrac{1.60E}{\sqrt{\dfrac{L_v}{D}}\left(\dfrac{D}{t}\right)^{5/4}} = \dfrac{1.60(29,\ 000)}{\sqrt{\dfrac{192}{16.0}}\left(\dfrac{16.0}{0.349}\right)^{5/4}} = 112\text{ ksi} \\ \dfrac{0.78E}{\left(D/t\right)^{3/2}} = \dfrac{0.78(29,\ 000)}{\left(16.0/0.349\right)^{3/2}} = 72.9\text{ ksi} \end{cases}$$

The maximum permitted value is $F_{cr} \le 0.6F_y = 0.6(42) = 25.2\ ksi$ (governs).

Nominal Shear Strength

$$V_n = F_{cr}A_g / 2 = (25.2)(17.2) / 2 = 217\text{ kips} \qquad \text{(Eq. G2-1)}$$

The available shear strength:

LRFD: $\phi_v V_n = 0.90(217) = 195\ kips$

ASD: $V_n / \Omega_v = {}^{217}/_{1.67} = 130\ kips$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	195	195	none	
V_n/Ω_v (kips) [ASD]	130	130	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 HSSP Shear Capacity G.STD` is typically installed with the program.

V. AISC 360-10 - G-6

Reference

Design Examples, Version 14.0, American Institute of Steel Construction, 2011, page G-13.

Note: This reference is freely available for download from the AISC website at https://www.aisc.org/globalassets/aisc/university-programs/teaching-aids/first-semester-design-examples.pdf

Related Links

- *D1.A.5.4 Design for Shear* (on page 1094)

Problem

From the reference:

> Verify the available shear strength and adequacy of a W21×48 ASTM A992 beam with end shears of 20.0 kips from dead load and 60.0 kips from live load in the weak direction.

Refer to the reference for calculations.

Comparison

Table 752: Comparison of results

Result Type	Reference	STAAD.Pro	Difference
$\phi_v V_n$ (kips) [LRFD]	189	189	none
V_n / Ω_v (kips) [ASD]	126	126	none

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 - G-6.STD` is typically installed with the program.

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

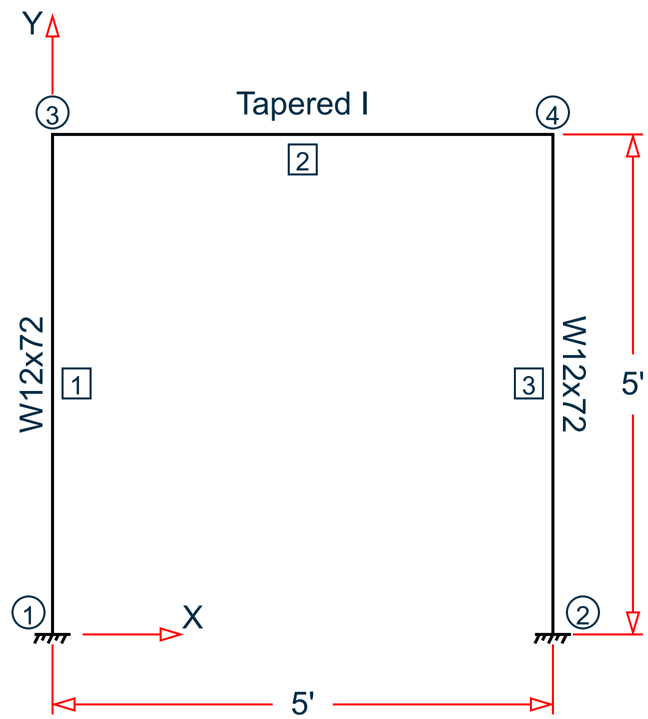
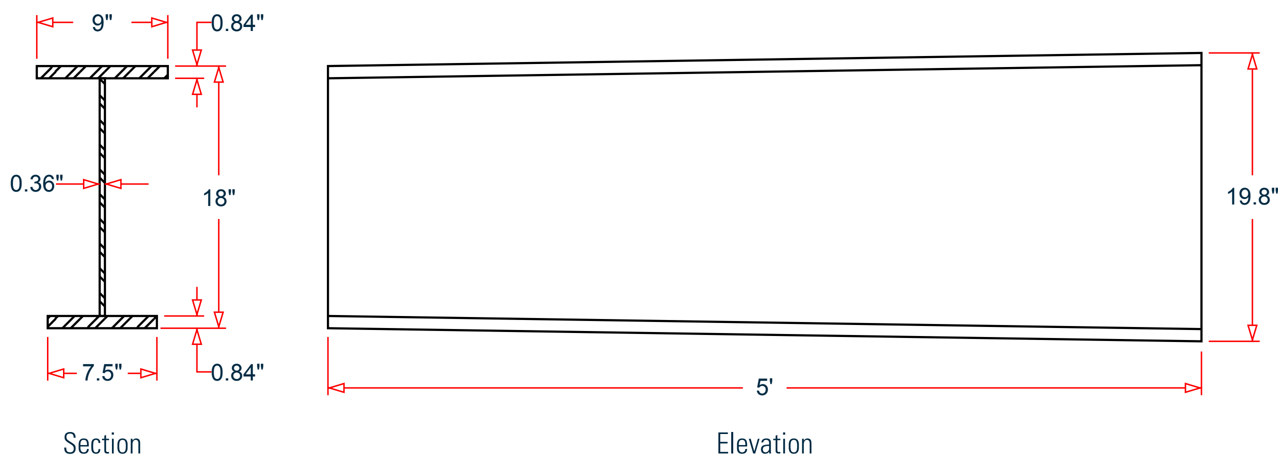
V. AISC 360-10 Tapered I Section

Verify the axial compression capacity, flexure capacity, and interaction ratio of a tapered I section member per both the LRFD and ASD methods of the AISC 360-10 code.

Details

A 5' × 5' portal frame consists of W12x72 columns and a steel tapered member for the beam.





The following load cases are evaluated:

1. A uniformly distributed load of -3.5 k/ft along the beam in the global Y direction.
2. Lateral loads at the top of the left column of 50 kips in the global X direction and 25 kips in the global Z direction (out of plane).
3. Lateral loads at the top of the right column of -50 kips in the global X direction and 45 kips in the global Z direction (out of plane).
4. A concreted load of -100 kips in the global Y direction and a concentrated torque of 9 in·kips at mid-span of the beam.

Material Properties

E = 29,000 ksi
Fy = 50 ksi

Validation

Design Forces

By inspection, the left end of the beam (shallowest overall depth) governs under the symmetric loads present. The following design loads are used from the STAAD.Pro analysis are then used:

1. M_z = 32.26 in·kips, F_y = 8.755 kips
2. M_z = 677.6 in·kips, M_y = 2.942 in·kips, M_x = 5.106 in·kips, F_y = 22.49 kips, F_z = 0.098 kips, F_x = 24.70 kips
3. M_z = 275.9 in·kips, M_x = 4.497 in·kips, F_y = 50.23 kips, F_x = 5.473 kips
4. M_z = 654.5 in·kips, M_y = 5.298 in·kips, M_x = 9.192 in·kips, F_y = 22.50 kips, F_z = 0.177 kips, F_x = 24.35 kips

Section Properties

The section at the left end ($D = 18\ in.$) has the following properties:

Web height, $d_w = 18 - 2{\times}0.84 = 16.32\ in.$
Area, $A_g = (0.84)(9 + 7.5) + 16.32\ (0.36) = 19.74\ in^2$
Shear area in local y, $A_y = 16.32(0.36) = 5.875\ in^2$
Shear area in local x, $A_x = 0.84(9 + 7.5) = 13.86\ in^2$

Dist to centroid y, $c = \dfrac{7.5(0.84)\left(\frac{0.84}{2}\right) + 0.36(16.32)\left(0.84 + \frac{16.32}{2}\right) + 9(0.84)\left(18 - \frac{0.84}{2}\right)}{19.74} = 9.548\ in.$

Moment of inertia about major axis,

$$I_{zz} = \begin{aligned} &\frac{7.5(0.84)^3}{12} + 7.5(0.84)\left(9.548 - \frac{0.84}{2}\right)^2 \\ &+ \frac{0.36(16.32)^3}{12} + 0.36(16.32)\left(9.548 - \frac{16.32}{2} - 0.84\right)^2 \\ &+ \frac{9(0.84)^3}{12} + 9(0.84)\left(18 - \frac{0.84}{2} - 9.548\right)^2 \end{aligned} = 1,\ 147\ \text{in}^4$$

Moment of inertia about minor axis,

$$I_{yy} = \frac{0.84(9)^3}{12} + \frac{16.32(0.36)^3}{12} + \frac{0.84(7.5)^3}{12} = 80.62\ \text{in}^4$$

Elastic section modulus about major axis top flange fiber, $S_{xx,top} = \dfrac{I_{zz}}{D - c} = \dfrac{1,\ 146}{18 - 9.548} = 135.5\ in^3$

Elastic section modulus about major axis bottom flange fiber, $S_{xx,bottom} = \dfrac{I_{zz}}{c} = \dfrac{1,\ 146}{9.548} = 120.0\ in^3$

Elastic section modulus about minor axis, $S_{yy} = \dfrac{I_{yy}}{b_{f1} / 2} = \dfrac{80.62}{9 / 2} = 17.92\ in^3$

Radius of gyration about major axis, $r_x = \sqrt{\dfrac{I_{zz}}{A_g}} = \sqrt{\dfrac{1,\ 147}{19.74}} = 7.619\ in$

Radius of gyration about minor axis, $r_y = \sqrt{\dfrac{I_{yy}}{A_g}} = \sqrt{\dfrac{80.62}{19.74}} = 2.021\ in$

Location of the plastic neutral axis, $y_{PNA} = 0.84 + \frac{19.74 - 2(7.5)(0.84)}{2 \times 0.36} = 10.75\ in.$

Plastic section modulus about major axis,

$$Z_{zt} = \frac{7.5(10.75)^2}{2} - \frac{(7.5 - 0.36)(10.75 - 0.84)^2}{2} + \frac{9(18 - 10.75)^2}{2} - \frac{(9 - 0.36)(18 - 0.84 - 10.75)^2}{2} = 141.8\ \text{in}^3$$

Plastic section modulus about minor axis, $Z_y = \frac{0.84(9)^2}{4} + \frac{16.32(0.36)^2}{4} + \frac{0.84(7.5)^2}{4} = 29.35\ in^3$

Torsional constant, $J = \frac{9(0.84)^3 + 16.32(0.36)^3 + 7.5(0.84)^3}{3} = 3.514\ in.^4$

Section Classification

Flange in compression

$$\lambda = \frac{b}{t} = \frac{1/2 \times 7.5}{0.84} = 4.464$$

$$k_c = \frac{4}{\sqrt{d_w / t_w}} = \frac{4}{\sqrt{\frac{16.32}{0.36}}} = 0.594$$

Per Table B4.1a, $\lambda < \lambda_r = 0.64\sqrt{\frac{k_c E}{F_y}} = 0.64\sqrt{\frac{0.594(29,000)}{50}} = 11.88$, therefore flanges are non-slender for compression.

Web in compression

$$\lambda = \frac{d_w}{t_w} = \frac{16.32}{0.36} = 45.33$$

Per Table B4.1a, Case 5, $\lambda > \lambda_r = 1.49\sqrt{\frac{E}{F_y}} = 1.49\sqrt{\frac{29,000}{50}} = 35.88$, therefore the web is slender for compression.

Flange in bending (use half the longer flange width as the outstanding width):

$$\lambda = \frac{b_f}{t_f} = \frac{9}{2(0.84)} = 5.36$$

Per Table B4.1b, Case 11, $\lambda < \lambda_p = 0.38\sqrt{\frac{E}{F_y}} = 0.38\sqrt{\frac{29,000}{50}} = 9.15$, therefore flange is compact for bending.

Web in bending

$$\lambda = \frac{d_w}{t_w} = \frac{16.32}{0.36} = 45.33$$

Per Table B4.1b, Case 15, $\lambda < \lambda_p = 3.76\sqrt{\frac{E}{F_y}} = 3.76\sqrt{\frac{29,000}{50}} = 90.55$, therefore web is compact for bending.

Compression Capacity

About X Axis:

$$\frac{k_x L_x}{r_x} = \frac{1.0(60)}{7.619} = 7.875 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,\ 000}{50}} = 113.4$$

$$F_{ex} = \frac{\pi^2 E}{\left(\frac{k_x L_x}{r_x}\right)^2} = \frac{\pi^2 \times 29,\ 000}{(7.875)^2} = 4{,}615 \text{ ksi} \quad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_{ex}} = \frac{50}{4{,}615} = 0.011 < 2.25$$

$$F_{crx} = 0.658^{F_y / F_{ex}} F_y = 0.658^{(0.011)} 50 = 49.77 \text{ ksi} \quad \text{(Eq. E3-2)}$$

Since the web is slender, use the effective area. The effective width imperfection adjustment factors (Table E7.1):

$c_1 = 0.18$

$c_2 = 1.31$

$$F_{el} = \left(c_2 \frac{\lambda_r}{\lambda}\right)^2 F_y = \left(1.31 \frac{35.88}{45.33}\right)^2 = 53.76 \text{ ksi} \quad \text{(Eq. E7-5)}$$

Therefore, the effective depth of the web in compression for the effective area:

$$d_e = d_w \left(1 - c_1 \sqrt{\frac{F_{el}}{F_{crx}}}\right) \sqrt{\frac{F_{el}}{F_{crx}}} = 16.32\left(1 - 0.18\sqrt{\frac{53.76}{49.77}}\right)\sqrt{\frac{53.76}{49.77}} = 13.78 \text{ in.} \quad \text{(Eq. E7-3)}$$

The reduced area of the section then becomes:

$$A_e = 19.75 - (16.32 - 13.78)0.36 = 18.84 \text{ in.}^2$$

$$P_{nx} = A_e \times F_{crx} = 18.84 \times 49.77 = 937.4 \text{ kips} \quad \text{(Eq. E7-1)}$$

About Y Axis:

$$\frac{k_y L_y}{r_y} = \frac{1.0(60)}{2.021} = 29.69 < 4.71\sqrt{\frac{E}{F_y}} = 113.4$$

$$F_{ey} = \frac{\pi^2 E}{\left(\frac{k_y L_y}{r_y}\right)^2} = \frac{\pi^2 \times 29,\ 000}{(29.69)^2} = 324.7 \text{ ksi} \quad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_{ey}} = \frac{50}{324.7} = 0.154 < 2.25$$

$$F_{cry} = 0.658^{(F_y / F_{ey})} F_y = 0.658^{(0.154)} 50 = 46.88 \text{ ksi} \quad \text{(Eq. E3-2)}$$

Therefore, the effective depth of the web in compression for the effective area:

$$d_e = d_w \left(1 - c_1 \sqrt{\frac{F_{el}}{F_{cry}}}\right) \sqrt{\frac{F_{el}}{F_{cry}}} = 16.32\left(1 - 0.18\sqrt{\frac{53.76}{46.88}}\right)\sqrt{\frac{53.76}{46.88}} = 14.11 \text{ in.} \quad \text{(Eq. E7-3)}$$

The reduced area of the section then becomes:

$$A_e = 19.75 - (16.32 - 14.11)0.36 = 18.93 \text{ in.}^2$$

$$P_{ny} = A_e \times F_{cry} = 18.93 \times 46.88 = 887.4 \text{ kips} \quad \text{(Eq. E7-1)}$$

The Y axis governs; $P_n = P_{ny}$. The axial capacity:

The ultimate compression capacity (LRFD) = $\phi_c P_n = 0.9 \times 887.4 = 798.3 \; kips$
The allowable compression capacity (ASD) = $P_n / \Omega_c = 887.4 \;/\; 1.67 = 531.4 \; kips$

Calculate Bending Capacity

Bending capacity in plastic yielding about Y axis:

$$M_y = F_y \times Z_y = 50 \times 29.35 = 1{,}468 \text{ in·kips} > 1.6F_y \times S_y = 1.6\ (50)\ (17.92) = 1{,}434 \text{ in·kips}$$

Use $M_y = 1{,}434 \; in \cdot kips$

The bending capacity for flexural yielding about the Y axis:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 1{,}434 = 1{,}290 \; in \cdot kips$
The allowable bending capacity (ASD) = $M_y / \Omega_b = 1{,}434 \;/\; 1.67 = 858.4 \; in \cdot kips$

Bending capacity in plastic yielding about X axis:

The section is capacity is determined as per F4 in the specification. The design moments for this are from Load Case 4 and occur at mid-span (d = 18.9 in.). The section properties at this location are:

$I_{zz} = 1{,}278 \; in^4$
$I_{yy} = 80.63 \; in^4$
$c = 10.01 \; in$
$h_c = 2 \times (10.01 - 0.84) = 18.35 \; in.$
$S_x = 143.8 \; in^3$
$Z_x = 150.7 \; in^3$

$$M_{yc} = F_y \times S_{yc} = 50 \times 143.8 = 7{,}192 \text{ ksi}$$

$$M_p = F_y \times Z_x = 50 \times 150.7 = 7{,}535 \text{ ksi} \le 1.6\ F_y \times S_x = 11{,}504 \text{ ksi}$$

The moment of inertia of the compression flange about the Y axis $I_{yc} = \frac{0.84(7.5)^3}{12} = 29.53 \; in.^4$, and thus $I_{yc} \,/\, I_y = {}^{29.53}\!/_{80.63} = 0.366 > 0.23.\ \frac{h_c}{t_w} = \frac{18.35}{0.36} = 50.99 < \lambda_{pw} = 90.55$ (limiting slenderness for a compact web per Table B4.1b case 15), so the web plastification factor, R_{pc} is determined as:

$$R_{pc} = \frac{M_p}{M_{yc}} = \frac{7{,}535}{7{,}192} = 1.048 \quad \text{(F4-9a)}$$

Bending capacity in plastic yielding about Y axis:

$$M_n = R_{pc} \times M_{yc} = 1.048 \times 7{,}192 = 7{,}535 \text{ in·kips}$$

The bending capacity for flexural yielding about the Y axis:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 7{,}535 = 6{,}782 \; in \cdot kips$
The allowable bending capacity (ASD) = $M_y / \Omega_b = 7{,}535 \;/\; 1.67 = 4{,}512 \; in \cdot kips$

Interaction Ratio for Bending and Compression

Check the interaction ratio for Load Case 3:

$$\frac{P_r}{P_c} = \frac{5.473}{798.3} = 0.007 < 0.2 \text{ (LRFD)}$$

$$\frac{P_r}{P_c} = \frac{5.479}{531.4} = 0.010 < 0.2 \text{ (ASD)}$$

So use Eq. H1-1b for both methods: $\frac{P_r}{2P_c} + \left(\frac{M_{rx}}{M_{cx}} + \frac{M_{ry}}{M_{cy}}\right) \leq 1.0.$

$$\frac{0.007}{2} + \left(\frac{1{,}225}{6{,}783} + \frac{0}{1{,}290}\right) = 0.184 \text{ (LRFD)}$$

$$\frac{0.010}{2} + \left(\frac{1{,}225}{4{,}513} + \frac{0}{858}\right) = 0.277 \text{ (ASD)}$$

Results

Table 753:

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Compression capacity (kips)	798.3	799	negligible	
	Major axis bending capacity (in·kips)	6,782	6,780	negligible	
	Minor axis bending capacity (in·kips)	1,290	1,290	none	
	Interaction ratio	0.184	0.184	none	
ASD	Compression capacity (kips)	531.4	532	negligible	
	Major axis bending capacity (in·kips)	4,512	4,510	negligible	
	Minor axis bending capacity (in·kips)	858.4	858	negligible	
	Interaction ratio	0.277	0.277	none	

The following D1.A.6 Design Parameters (on page 1100) are used:

- The welded tapered member is specified using `STP 2`

The remaining parameters all use their default values.

STAAD.Pro Input

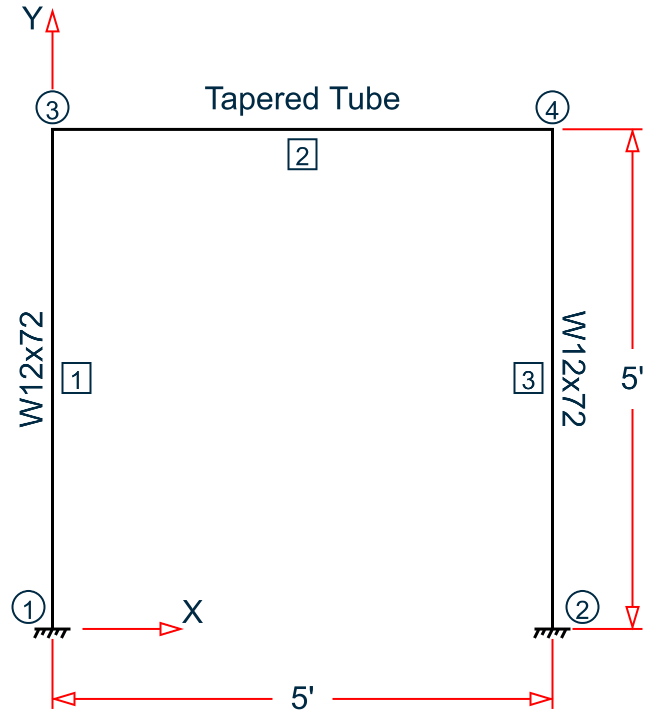
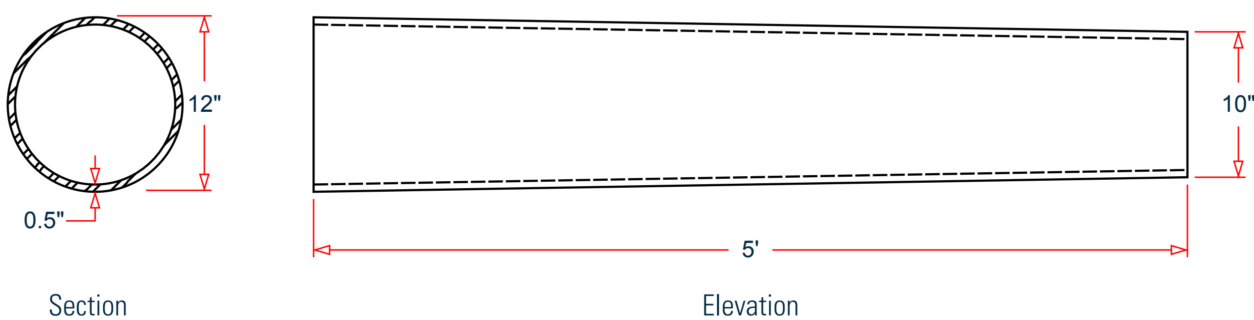
V. AISC 360-10 Tapered Tube Section

Verify the axial compression capacity, flexure capacity, and interaction ratio of a tapered tube section member per both the LRFD and ASD methods of the AISC 360-10 code.

Details

A 5' × 5' portal frame consists of W12x72 columns and a steel tapered member for the beam.





The following load cases are evaluated:

1. A uniformly distributed load of -2.25 k/in along the beam in the global Y direction.
2. Lateral loads at the top of the left column of 50 kips in the global X direction and 25 kips in the global Z direction (out of plane).
3. A concreted torque of 0.75 in·kips at mid-span of the beam.

Material Properties

E = 29,000 ksi
Fy = 50 ksi

Validation

Design Forces

By inspection, the right end of the beam (shallowest overall depth) governs under the symmetric loads present. The following design loads are used from the STAAD.Pro analysis are then used:

$M_z = 505.66\ in \cdot kips$
$F_y = 67.2\ kips$
$F_x = 10.23\ kips$

Section Properties

The section at the right end ($OD = 10\ in.$) has the following properties:

Inner diameter, ID = 9 in.
Area, $A_g = (\pi/4)(OD^2 - ID^2) = 14.92\ in^2$
Form factor = $0.49 + 0.8\ (t\ /\ OD) = 0.53$
Shear area, $A_y = 14.92(0.53) = 7.909\ in^2$
Moment of inertia,

$$I = \frac{\pi}{64}\left(\mathrm{OD}^4\text{-}\mathrm{ID}^4\right) = 168.8\ \mathrm{in}^4$$

Elastic section modulus, $S = \frac{\pi}{32}\left(\frac{OD^4\text{-}ID^4}{OD}\right) = 33.76\ in^3$

Radius of gyration, $r = \sqrt{\frac{I}{A_g}} = \sqrt{\frac{168.8}{14.92}} = 3.363\ in$

Plastic section modulus, $Z = \frac{OD^3\text{-}ID^3}{6} = 45.17\ in^3$

HSS Torsional constant, $C = \frac{\pi}{2}(OD\text{-}t)^2 t = 70.88\ in^3$

Section Classification

Flange in compression

$$\lambda = \frac{\mathrm{OD}}{t} = \frac{10}{0.5} = 20$$

Per Table B4.1a, Case 9, $\lambda < \lambda_r = 0.11\frac{E}{F_y} = 63.8$, therefore flanges are non-slender for compression. The web is similarly non-slender for compression.

Flange in bending (use half the longer flange width as the outstanding width):

$$\lambda = \frac{\mathrm{OD}}{t} = \frac{10}{0.5} = 20$$

Per Table B4.1b, Case20, $\lambda < \lambda_r = 0.07\frac{E}{F_y} = 40.6$, therefore flange is compact for bending.

Compression Capacity

$$\frac{kL}{r} = \frac{1.0(60)}{3.363} = 17.84 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,\ 000}{50}} = 113.4$$

$$F_e = \frac{\pi^2 E}{\left(\frac{kL}{r}\right)^2} = \frac{\pi^2 \times 29{,}000}{(17.84)^2} = 899.4\ \mathrm{ksi} \qquad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_e} = \frac{50}{899.4} = 0.056 < 2.25$$

$$F_{\mathrm{crx}} = 0.658^{F_y/F_e} F_y = 0.658^{(0.056)} 50 = 48.85\ \mathrm{ksi} \qquad \text{(Eq. E3-2)}$$

$$P_n = A_g \times F_{cr} = 14.92 \times 48.85 = 729.0 \text{ kips} \quad \text{(Eq. E3-1)}$$

The axial capacity:

The ultimate compression capacity (LRFD) = $\phi_c P_n = 0.9 \times 729.0 = 656.1 \text{ kips}$
The allowable compression capacity (ASD) = $P_n / \Omega_c = 729.0 / 1.67 = 436.5 \text{ kips}$

Shear Capacity

The distance from the maximum shear force (ends) to zero shear force (mid-span), $L_v = L / 2 = 30 \text{ in}$.

The critical shear stress, F_{cr}, *is the minimum of*:

$$F_{cr1} = \frac{1.60E}{\sqrt{\frac{L_v}{OD}}\left(\frac{OD}{t}\right)^{5/4}} = 633.4 \text{ ksi}$$

$$F_{cr2} = \frac{0.78E}{\left(\frac{OD}{t}\right)^{3/2}} = 252.9 \text{ ksi}$$

$$F_{cr3} = 0.6F_y = 30 \text{ ksi}$$

$F_{cr} = 30 \text{ ksi}$

Nominal shear capacity:

$$V_n = F_{cr} A_g / 2 = 223.8 \text{ kips}$$

The shear capacity:

The ultimate shear capacity (LRFD) = $\phi_c V_n = 0.9 \times 223.8 = 201.5 \text{ kips}$
The allowable shear capacity (ASD) = $V_n / \Omega_c = 223.8 / 1.67 = 134.0 \text{ kips}$

Calculate Bending Capacity

Bending capacity in plastic yielding:

$$M_p = F_y \times Z = 50 \times 45.17 = 2{,}259 \text{ in·kips} < 1.6F_y \times S = 1.6 (50) (33.76) = 2{,}701 \text{ in·kips}$$

The bending capacity for flexural yielding:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 2{,}259 = 2{,}033 \text{ in·kips}$
The allowable bending capacity (ASD) = $M_y / \Omega_b = 2{,}259 / 1.67 = 1{,}352 \text{ in·kips}$

Torsional Capacity

The critical stress, F_{cr}, *is the larger of*:

$$F_{cr1} = \frac{1.23E}{\sqrt{\frac{L}{OD}}\left(\frac{OD}{t}\right)^{5/4}} = 344.3 \text{ ksi}$$

$$F_{cr2} = \frac{1.23E}{\left(\frac{OD}{t}\right)^{3/2}} = 194.5 \text{ ksi}$$

But shall not exceed:

$$F_{cr3} = 0.6F_y = 30 \text{ ksi}$$

$F_{cr} = 30\ ksi$

Nominal torsional capacity:

$$T_n = F_{cr}C = 2{,}126 \text{ in·kips}$$

The torsional capacity:

The ultimate torsional capacity (LRFD) = $\phi_c T_n = 0.9 \times 2{,}126 = 1{,}914\ kips$
The allowable torsional capacity (ASD) = $T_n / \Omega_c = 2{,}126\ /\ 1.67 = 1{,}273\ kips$

Interaction Ratio for Bending and Compression

Check the interaction ratio for Load Case 1:

$$\frac{P_r}{P_c} = \frac{10.23}{656.1} = 0.016 < 0.2 \text{ (LRFD)}$$

$$\frac{P_r}{P_c} = \frac{10.23}{436.5} = 0.023 < 0.2 \text{ (ASD)}$$

So use Eq. H1-1b for both methods: $\frac{P_r}{2P_c} + \left(\frac{M_{rx}}{M_{cx}} + \frac{M_{ry}}{M_{cy}}\right) \leq 1.0.$

$$\frac{0.016}{2} + \left(\frac{505.7}{2{,}033} + \frac{0}{2{,}033}\right) = 0.257 \text{ (LRFD)}$$

$$\frac{0.023}{2} + \left(\frac{505.7}{1{,}352} + \frac{0}{1{,}352}\right) = 0.386 \text{ (ASD)}$$

Results

Table 754:

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Compression capacity (kips)	656.1	656	negligible	
	Shear capacity (kips)	201.5	201	negligible	
	Bending capacity (in·kips)	2,033	2,030	negligible	
	Torsional capacity (in·kips)	1,914	1,910	negligible	
	Interaction ratio	0.257	0.257	none	
ASD	Compression capacity (kips)	436.5	437	negligible	

Result Type		Reference	STAAD.Pro	Difference	Comments
	Shear capacity (kips)	134.0	134	negligible	
	Bending capacity (in·kips)	1,352	1,350	negligible	
	Torsional capacity (in·kips)	1,273	1,270	negligible	
	Interaction ratio	0.386	0.386	none	

The following D1.A.6 Design Parameters (on page 1100) are used:

- The welded tapered member is specified using `STP 2`

The remaining parameters all use their default values.

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 Tapered Tube Section.STD` is typically installed with the program.

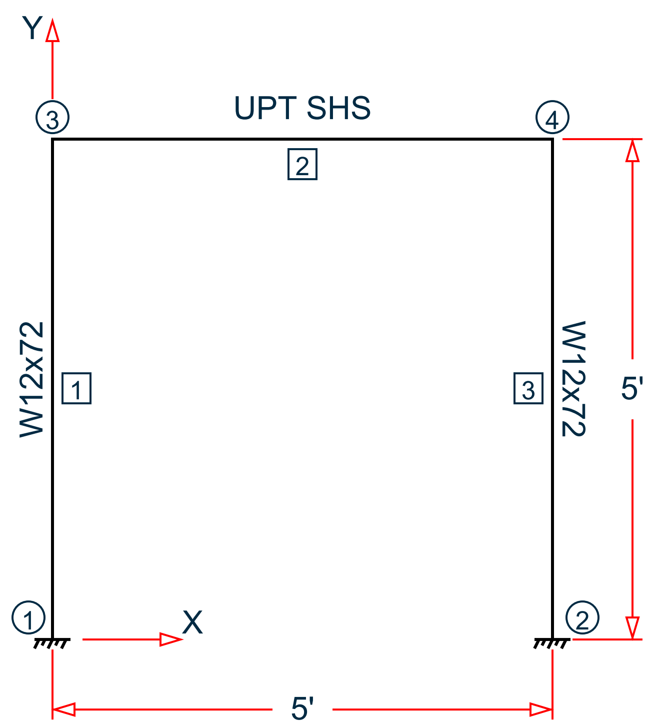
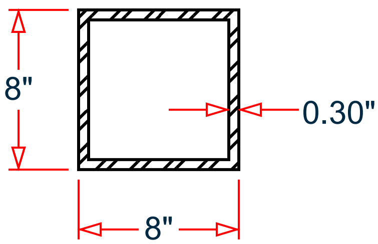
V. AISC 360-10 UPT Square Hollow Section

Verify the axial compression capacity, shear capacity, flexure capacity, torsional capacity, and interaction ratio of a user-provided hollow square section member per both the LRFD and ASD methods of the AISC 360-10 code.

Details

A 5' × 5' portal frame consists of W12x72 columns and a UPT SHS member for the beam. The section outer depth, D, is 8" and the thickness, t, is 0.30".





Section

The following load cases are evaluated:

1. A uniformly distributed load of -2.25 k/in along the beam in the global Y direction.
2. Lateral loads at the top of the left column of 50 kips in the global X direction and 25 kips in the global Z direction (out of plane).
3. A concentrated torque of 0.75 in·kips at mid-span of the beam.

Material Properties

E = 29,000 ksi
Fy = 50 ksi

Validation

Design Forces

The following design loads are used from the STAAD.Pro analysis are then used:

1. M_z = 599.6 in·kips, F_y = 67.5 kips

Section Properties

Inner depth, $d = 8 - 2\times0.30 = 7.40$ in.

Area, $A_g = D^2 - d^2 = 9.24\ in^2$

Shear area, $A_w = 2\times D\times t_w = 4.80\ in^2$

Moment of inertia, $I = \frac{1}{12}\left(D^4 - d^4\right) = 91.45\ in^4$

Elastic section modulus, $S = \frac{I}{D / 2} = \frac{91.45}{8 / 2} = 22.86\ in^3$

Radius of gyration, $r = \sqrt{\frac{I}{A_g}} = \sqrt{\frac{91.45}{9.24}} = 3.146\ in$

Plastic section modulus, $Z = \frac{1}{6}\left(D^3 - d^3\right) = 26.69\ in^3$

HSS Torsional constant, $C = 2\left(B - t_w\right)\left(D - t_w\right)t_w - 4.5\left(4 - \pi\right)t_w{}^3 = 35.47\ in^3$

Section Classification

The design thickness, $t = 0.93\times t_w = 0.279\ in$

The design depth, $d = D - 3t = 7.163\ in$

Flange in compression

$$\lambda = \frac{d}{t} = \frac{7.163}{0.279} = 25.67$$

Per Table 4.1a Case 6, $\lambda < \lambda_r = 1.40\sqrt{\frac{E}{F_y}} = 1.40\sqrt{\frac{29,000}{50}} = 33.72$, therefore flanges are non-slender for compression. Similar for the web of the square section.

Flexure classification of flange:

Per Table 4.1b, Case 17, $\lambda < \lambda_p = 1.12\sqrt{\frac{E}{F_y}} = 1.12\sqrt{\frac{29,000}{50}} = 26.97$, therefore flange is compact for bending.

Flexure classification of web:

Per Table 4.1b, Case 19, $\lambda < \lambda_p = 2.42\sqrt{\frac{E}{F_y}} = 2.42\sqrt{\frac{29,000}{50}} = 58.28$, therefore web is compact for bending.

Compression Capacity

Effective slenderness ratio:

$$\frac{k_x L_x}{r_x} = \frac{1.0(60)}{3.146} = 19.07 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,000}{50}} = 113.4$$

Elastic buckling stress:

$$F_e = \frac{\pi^2 E}{\left(\frac{k_x L_x}{r_x}\right)^2} = \frac{\pi^2 \times 29,000}{(19.07)^2} = 787 \text{ ksi} \qquad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_e} = \frac{50}{787} = 0.064 < 2.25$$

Critical buckling stress:

$$F_{cr} = 0.658^{F_y/F_e} F_y = 0.658^{(0.064)} 50 = 48.68 \text{ ksi} \qquad \text{(Eq. E3-2)}$$

Nominal buckling strength:

$$P_n = A_g \times F_{cr} = 9.24 \times 48.68 = 449.9 \text{ kips} \qquad \text{(Eq. E3-1)}$$

The axial capacity:

The ultimate compression capacity (LRFD) = $\phi_c P_n = 0.9 \times 449.9 = 404.9$ *kips*

The allowable compression capacity (ASD) = $P_n / \Omega_c = 449.9 \ / \ 1.67 = 269.4$ *kips*

Calculate Shear Capacity The nominal shear strength:

$$V_n = 0.6 \times F_y \times A_w \times C_{v2} \qquad \text{(Eq. G4-1)}$$

where

C_{v2} = 1.0 per Section G2.2 with $h/t = 25.67$ and $K_v = 5$.

$$V_n = 0.6\ (50)\ (4.80)\ (1.0) = 144 \text{ kips}$$

The shear capacity:

The ultimate shear capacity (LRFD) = $\phi_v V_n = 0.9 \times 144 = 129.6$ *kips*

The allowable shear capacity (ASD) = $V_n / \Omega_v = 144 \ / \ 1.67 = 86.23 \ kips$

Calculate Bending Capacity

Bending capacity in plastic yielding (compact section):

$$M_p = F_y \times Z_x = 50 \times 26.69 = 1{,}335 \text{ in·kips} \qquad \text{(Eq F7-1)}$$

The bending capacity for flexural yielding about the Y axis:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 1{,}335 = 1{,}201 \ in \cdot kips$
The allowable bending capacity (ASD) = $M_y / \Omega_b = 1{,}335 \ / \ 1.67 = 799.2 \ in \cdot kips$

Torsional Capacity

$$\frac{h}{t} = 25.67 < 2.45\sqrt{\frac{E}{F_y}} = 59.0$$

$$F_{cr} = 0.6F_y = 30 \text{ ksi}$$

Nominal torsional capacity:

$$T_n = F_{cr} \times C = 1{,}064 \text{ ksi}$$

The torsional capacity:

The ultimate torsional capacity (LRFD) = $\phi_T T_n = 0.9 \times 1{,}064 = 957.7 \ kips$
The allowable torsional capacity (ASD) = $T_n / \Omega_T = 1{,}064 \ / \ 1.67 = 637.2 \ kips$

Interaction Ratio for Bending and Compression

Check the interaction ratio for Load Case 1:

$$\frac{P_r}{P_c} = \frac{11.80}{404.9} = 0.029 < 0.2 \text{ (LRFD)}$$

$$\frac{P_r}{P_c} = \frac{11.80}{269.4} = 0.044 < 0.2 \text{ (ASD)}$$

So use Eq. H1-1b for both methods: $\frac{P_r}{2P_c} + \left(\frac{M_{rx}}{M_{cx}} + \frac{M_{ry}}{M_{cy}}\right) \leq 1.0$.

$$\frac{0.029}{2} + \left(\frac{599.7}{1{,}201} + \frac{0}{1{,}201}\right) = 0.514 \text{ (LRFD)}$$

$$\frac{0.044}{2} + \left(\frac{599.7}{799.2} + \frac{0}{799.2}\right) = 0.765 \text{ (ASD)}$$

Results

Table 755:

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Compression capacity (kips)	404.9	405	negligible	

Result Type		Reference	STAAD.Pro	Difference	Comments
	Bending capacity (in·kips)	1,201	1,200	negligible	
	Shear capacity (kips)	129.6	130	negligible	
	Torsional capacity (in·kips)	957.7	958	negligible	
	Interaction ratio	0.514	0.514	negligible	
ASD	Compression capacity (kips)	269.4	269	negligible	
	Bending capacity (in·kips)	799.2	799	negligible	
	Shear capacity (kips)	86.23	86.2	negligible	
	Torsional capacity (in·kips)	637.2	637	negligible	
	Interaction ratio	0.765	0.772	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 UPT Square Hollow Section.STD` is typically installed with the program.

The following D1.A.6 Design Parameters (on page 1100) are used:

- The welded SHS member is specified using `STP 2`
- Shear lag factor, U for tension rupture capacity is specified by `SLF 0.8`

The remaining parameters all use their default values.

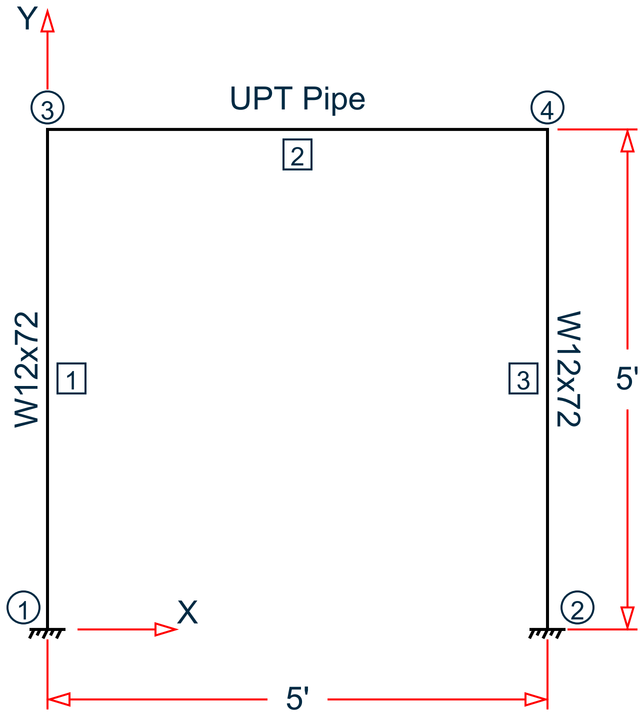
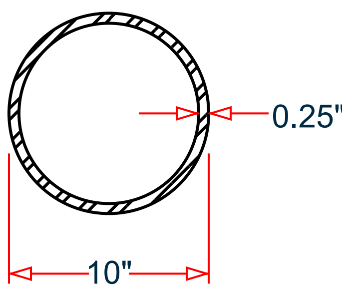
V. AISC 360-10 UPT Pipe Section

Verify the axial compression capacity, flexure capacity, and interaction ratio of a tapered I section member per both the LRFD and ASD methods of the AISC 360-10 code.

Details

A 5' × 5' portal frame consists of W12x72 columns and a UPT pipe member for the beam. The pipe outer diameter, D, is 10" and the thickness, t, is 0.25".





Section

The following load cases are evaluated:

1. A uniformly distributed load of -2.25 k/in along the beam in the global Y direction.
2. Lateral loads at the top of the left column of 50 kips in the global X direction and 25 kips in the global Z direction (out of plane).
3. A concentrated torque of 0.75 in·kips at mid-span of the beam.

Material Properties

E = 29,000 ksi
Fy = 50 ksi

Validation

Design Forces

The following design loads are used from the STAAD.Pro analysis are then used:

1. M_z = 599.6 in·kips, F_y = 67.5 kips

Section Properties

Inner diameter, $d = 10 - 2\times 0.25 = 9.5\ in.$
Area, $A_g = \frac{\pi}{4}\left(D^2 - d^2\right) = 7.66\ in^2$
Shear area, $A_y = A_x = A_g\ /\ 2 = 3.83\ in^2$
Moment of inertia, $I_x = I_y = \frac{\pi}{64}\left(D^4 - d^4\right) = 91.05\ in^4$
Elastic section modulus, $S_{xx} = \frac{I_{xx}}{D\ /\ 2} = \frac{91.05}{10\ /\ 2} = 18.21\ in^3$
Radius of gyration, $r_x = \sqrt{\frac{I_{xx}}{A_g}} = \sqrt{\frac{91.05}{7.66}} = 3.448\ in$
Plastic section modulus, $Z_x = \frac{1}{6}\left(D^3 - d^3\right) = 23.77\ in^3$
HSS Torsional constant, $C = \frac{\pi}{2}(D - t)^2 t = 37.33\ in^3$

Section Classification

Flange in compression

$$\lambda = \frac{D}{t} = \frac{10}{0.25} = 40$$

Per Table 4.1a Case 9, $\lambda < \lambda_r = 0.11\frac{E}{F_y} = 0.11\frac{29,000}{50} = 63.8$, therefore flanges are non-slender for compression.

Web in compression

Per Table 4.1a, Case 9, $\lambda < \lambda_r = 0.11\frac{E}{F_y} = 0.11\frac{29,000}{50} = 63.8$, therefore the web is non-slender for compression.

Flexure classification:

Per Table 4.1b, Case 20, $\lambda < \lambda_p = 0.07\frac{E}{F_y} = 0.11\frac{29,000}{50} = 40.6$, therefore flange is compact for bending.

Compression Capacity

Effective slenderness ratio:

$$\frac{k_x L_x}{r_x} = \frac{1.0(60)}{3.448} = 17.40 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,\ 000}{50}} = 113.4$$

Elastic buckling stress:

$$F_e = \frac{\pi^2 E}{\left(\frac{k_x L_x}{r_x}\right)^2} = \frac{\pi^2 \times 29,\ 000}{(17.40)^2} = 945\text{ ksi} \qquad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_e} = \frac{50}{945} = 0.053 < 2.25$$

Critical buckling stress:

$$F_{cr} = 0.658^{F_y / F_e} F_y = 0.658^{(0.053)} 50 = 48.91 \text{ ksi} \qquad \text{(Eq. E3-2)}$$

Nominal buckling strength:

$$P_n = A_g \times F_{cr} = 7.66 \times 48.91 = 374.5 \text{ kips} \qquad \text{(Eq. E3-1)}$$

The axial capacity:

The ultimate compression capacity (LRFD) = $\phi_c P_n = 0.9 \times 374.5 = 337.0 \text{ kips}$
The allowable compression capacity (ASD) = $P_n / \Omega_c = 374.5 \; / \; 1.67 = 224.3 \text{ kips}$

<u>Calculate Shear Capacity</u>

Critical stress is the minimum of F_{cr1}, F_{cr2}, and F_{cr3}:

$$F_{cr1} = \frac{1.23E}{\sqrt{\frac{L}{D}}\left(\frac{D}{t}\right)^{\left(5/4\right)}} = 144.8 \text{ ksi}$$

$$F_{cr2} = \frac{0.78E}{\left(\frac{D}{t}\right)^{\left(3/2\right)}} = 89.4 \text{ ksi}$$

$$F_{cr3} = 0.6F_y = 30 \text{ ksi}$$

So, $F_{cr} = 30 \text{ ksi}$.

The nominal shear strength:

$$V_n = F_{cr} \times A_x = 30 \times 3.83 = 114.9 \text{ kips}$$

The axial capacity:

The ultimate shear capacity (LRFD) = $\phi_v V_n = 0.9 \times 114.9 = 103.4 \text{ kips}$
The allowable shear capacity (ASD) = $V_n / \Omega_v = 114.9 \; / \; 1.67 = 68.78 \text{ kips}$

<u>Calculate Bending Capacity</u>

Bending capacity in plastic yielding (compact section):

$$M_y = F_y \times Z_x = 50 \times 23.77 = 1{,}189 \text{ in}\cdot\text{kips} \qquad \text{(Eq F8-1)}$$

The bending capacity for flexural yielding about the Y axis:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 1{,}189 = 1{,}070 \text{ in}\cdot\text{kips}$
The allowable bending capacity (ASD) = $M_y / \Omega_b = 1{,}189 \; / \; 1.67 = 711.7 \text{ in}\cdot\text{kips}$

<u>Interaction Ratio for Bending and Compression</u>

Check the interaction ratio for Load Case 1:

$$\frac{P_r}{P_c} = \frac{11.75}{337.0} = 0.034 < 0.2 \text{ (LRFD)}$$

$$\frac{P_r}{P_c} = \frac{11.75}{224.3} = 0.052 < 0.2 \text{ (ASD)}$$

So use Eq. H1-1b for both methods: $\frac{P_r}{2P_c} + \left(\frac{M_{rx}}{M_{cx}} + \frac{M_{ry}}{M_{cy}}\right) \le 1.0$.

$$\frac{0.034}{2} + \left(\frac{599.6}{1{,}070} + \frac{0}{1{,}070}\right) = 0.578 \text{ (LRFD)}$$

$$\frac{0.052}{2} + \left(\frac{599.6}{711.7} + \frac{0}{711.7}\right) = 0.869 \text{ (ASD)}$$

Calculate Torsion Capacity

Critical stress is the minimum of F_{cr1}, F_{cr2}, and F_{cr3}. From shear calculations, $F_{cr} = 30\ ksi$.

The nominal shear strength:

$$T_n = F_{cr} \times C = 30 \times 37.33 = 1{,}120 \text{ in·kips}$$

The axial capacity:

The ultimate torsional capacity (LRFD) = $\phi_T T_n = 0.9 \times 1{,}120 = 1{,}008$ *in·kips*
The allowable torsional capacity (ASD) = $T_n / \Omega_T = 114.9\ /\ 1.67 = 670.6$ *in·kips*

Results

Table 756:

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Compression capacity (kips)	337	337	none	
	Bending capacity (in·kips)	1,070	1,070	none	
	Shear capacity (kips)	103.4	103	negligible	
	Interaction ratio	0.578	0.578	none	
	Torsional capacity (in·kips)	1,008	1,010	negligible	
ASD	Compression capacity (kips)	224.3	224.3	none	
	Bending capacity (in·kips)	711.7	712	negligible	
	Shear capacity (kips)	68.78	68.8	negligible	
	Interaction ratio	0.869	0.869	none	

Result Type		Reference	STAAD.Pro	Difference	Comments
	Torsional capacity (in·kips)	670.6	671	negligible	

The following D1.A.6 Design Parameters (on page 1100) are used:

- The welded pipe member is specified using `STP 2`
- Shear lag factor, U for tension rupture capacity is specified by `SLF 0.8`

The remaining parameters all use their default values.

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 UPT Pipe Section.STD` is typically installed with the program.

V. AISC 360-10 C Weak Axis Shear G.7

Verify the available shear strength along the weak axis of a singly symmetric section per the LRFD and ASD methods of the AISD 360-10 code.

Details

From reference (2):

> Verify the available shear strength and adequacy of a C9×20 ASTM A36 channel with end shears of 5.00 kips from dead load and 15.0 kips from live load in the weak direction.

Validation

Ultimate load:

$$V_u = 1.2(5.0\text{ kips}) + 1.6(15.0\text{ kips}) = 30.0\text{ kips}$$

Service load:

$$V_a = 5.0\text{ kips} + 15.0\text{ kips} = 20.0\text{ kips}$$

Area of the flanges for shear:

$$A_w = 2b_f t_f = 2(2.65)(0.413) = 2.19\text{ in}^2$$

Section G2.1 of Reference 1 gives $k_v = 1.2$.

$$\frac{b_f}{t_f} = \frac{2.65}{0.413} = 6.42 < 1.10\sqrt{\frac{k_v E}{F_y}} = 1.10\sqrt{\frac{1.2(29,\ 000)}{36}} = 34.2$$

Therefore, $C_v = 1.0$.

<u>Nominal Shear Strength</u>

$$V_n = 0.6F_y A_w C_v = 0.6(36)(2.19)(1.0) = 47.3\text{ kips} \qquad \text{(Eq. G2-1)}$$

The available shear strength:

LRFD: $\phi_v V_n = 0.90(47.3) = 42.6\ kips$

ASD: $V_n / \Omega_v = {}^{47.3}\!/_{1.67} = 28.3\ kips$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	42.6	42.6	none	
V_n/Ω_v (kips) [ASD]	28.3	28.3	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 C Weak Axis Shear G.STD` is typically installed with the program.

V. AISC 360-10 W D.1

Verify the tensile strength a wide flange section per the LRFD and ASD methods of the AISD 360-10 code.

Details

From reference (2):

> Select an 8-in. W-shape, ASTM A992, to carry a dead load of 30 kips and a live load of 90 kips in tension. The member is 25 ft long. Verify the member strength by both LRFD and ASD with the bolted end connection shown [*in the reference*]. Verify that the member satisfies the recommended slenderness limit. Assume that connection limit states do not govern.

See example D.1 in reference (2) for calculations.

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yielding $\phi_t P_n$ (kips) [LRFD]	277	277	none	
Tensile rupture $\phi_t P_n$ (kips) [LRFD]	211	211	none	
Tensile yielding P_n/Ω_t (kips) [ASD]	184	184	none	
Tensile rupture P_n/Ω_t (kips) [ASD]	141	141	none	
Slenderness ratio	238	238.212	negligible

Problem

From the reference:

> Verify, by both ASD and LRFD, the tensile strength of an L4×4×1/2, ASTM A36 [...]. The member carries a dead load of 20 kips and a live load of 60 kips in tension. Calculate at what length this tension member would cease to satisfy the recommended slenderness limit. Assume that connection limit states do not govern.

Refer to the reference for calculations.

Comparison

Table 757: Comparison of results

Result Type	Reference	STAAD.Pro	Difference
Tensile yielding $\phi_t P_n$ (kips) [LRFD]	122	122	none
Tensile rupture $\phi_t P_n$ (kips) [LRFD]	125	125	none
Tensile yielding P_n / Ω_t (kips) [ASD]	80.8	80.8	none

Result Type	Reference	STAAD.Pro	Difference
Tensile rupture P_n/Ω_t (kips) [ASD]	83.5	83.4	negligible
L at which λ = *300* (ft)	19.4	19.4	none

To calculate the length at which the member would exceed the slenderness limit of 300: (6 in)/(slenderness ratio) × 300

$$(6\text{ in})/(7.732)\times 300 = 232.8\text{ in} = 19.4\text{ ft}$$

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 - D-2.STD` is typically installed with the program.

Tip: You can copy and paste this content directly into a `.std` file to run in STAAD.Pro.

V. AISC 360-10 WT D.3

Verify the tensile strength a WT section per the LRFD and ASD methods of the AISD 360-10 code.

- *D1.A.5.1 Axial Tension* (on page 1092)

Details

From reference (2):

A WT6×20, ASTM A992 member has a length of 30 ft and carries a dead load of 40 kips and a live load of 120 kips in tension. The end connection is fillet welded on each side for 16 in. Verify the member tensile strength by both LRFD and ASD. Assume that the gusset plate and the weld are satisfactory.

See example D.3 in reference (2) for calculations.

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yielding $\phi_t P_n$ (kips) [LRFD]	263	263	none	
Tensile rupture $\phi_t P_n$ (kips) [LRFD]	266	266	none	
Tensile yielding P_n/Ω_t (kips) [ASD]	175	175	none	
Tensile rupture P_n/Ω_t (kips) [ASD]	177	177	none	
Slenderness ratio	229	230.607	negligible

V. AISC 360-10 HSST D.4

Verify the tensile strength of a rectangular HSS section per the LRFD and ASD methods of the AISD 360-10 code.

Details

From reference (2):

> Verify the tensile strength of an HSS6×4×3/8, ASTM A500 Grade B, with a length of 30 ft. The member is carrying a dead load of 35 kips and a live load of 105 kips in tension. The end connection is a fillet welded 1/2-in.-thick single concentric gusset plate with a weld length of 16 in. Assume that the gusset plate and weld are satisfactory.

Validation

Ultimate load:

$$P_u = 1.2(35\text{ kips}) + 1.6(105\text{ kips}) = 210\text{ kips}$$

Service load:

$$P_a = 35\text{ kips} + 105 = 140\text{ kips}$$

<u>Tensile Yielding</u>

LRFD: $\phi_t P_n = \phi_t A_g F_y = 0.9(6.18)(46) = 256\ kips$

ASD: $P_n \big/ \Omega_c = \frac{A_g F_y}{\Omega_c} = \frac{(6.18)(46)}{1.67} = 170\ kips$

<u>Tensile Rupture</u>

Determine the shear lag factor for the effective area:

$$A_e = A_n U \quad \text{(Eq. D3-1)}$$

where

A_n = the net area; in this case allows for a 1/16-in gap in fit-up between the HSS and the gusset plate,

$= A_g - 2(t_p + 1/16)t = 6.18 - 2(0.5 + 1/16)0.349 = 5.79\ in^2$

$\bar{x}$ = $\frac{B^2 + 2BH}{4(B+H)} = \frac{(4.0)^2 + 2(4.0)(6.0)}{4(4.0 + 6.0)} = 1.60\ in$

U = $1 - \frac{\bar{x}}{l} = 1 - \frac{1.60}{16.0} = 0.90$

$$A_e = 5.79(0.90) = 5.21\ \text{in}^2$$

Nominal Tensile Rupture Strength

$$P_n = F_u A_e = 58(5.21) = 302\ \text{kips} \quad \text{(Eq D2-2)}$$

The available tensile strength:

LRFD: $\phi_t P_n = 0.75(302) = 227\ kips$

ASD: $P_n / \Omega_t = {}^{302}\!/_{2.00} = 151\ kips$

Slenderness

$$\frac{L}{r} = \frac{30 \times 12}{1.55} = 232$$

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yielding $\phi_t P_n$ (kips) [LRFD]	256	256	none	
Tensile rupture $\phi_t P_n$ (kips) [LRFD]	227	226	negligible	
Tensile yielding P_n/Ω_t (kips) [ASD]	170	170	none	
Tensile rupture P_n/Ω_t (kips) [ASD]	151	151	none	
Slenderness ratio	232	231.848	negligible

V. AISC 360-10 HSSP D.5

Verify the tensile strength a round HSS section per the LRFD and ASD methods of the AISD 360-10 code.

Details

From reference (2):

> Verify the tensile strength of an HSS6×0.500, ASTM A500 Grade B, with a length of 30 ft. The member carries a dead load of 40 kips and a live load of 120 kips in tension. Assume the end connection is a fillet welded 1/2-in.- thick single concentric gusset plate with a weld length of 16 in. Assume that the gusset plate and weld are satisfactory.

See example D.5 in reference (2) for calculations.

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yielding $\phi_t P_n$ (kips) [LRFD]	306	306	none	
Tensile rupture $\phi_t P_n$ (kips) [LRFD]	329	329	negligible	
Tensile yielding P_n / Ω_t (kips) [ASD]	203	203	none	
Tensile rupture P_n / Ω_t (kips) [ASD]	220	220	none	
Slenderness ratio	184	183.316	negligible

V. AISC 360-10 2L D.6

Verify the tensile strength a double angle section per the LRFD and ASD methods of the AISD 360-10 code.

Details

From reference (2):

> A 2L4×4×1/2 (3/8-in. separation), ASTM A36, has one line of (8) 3/4-in.-diameter bolts in standard holes and is 25 ft in length. The double angle is carrying a dead load of 40 kips and a live load of 120 kips in tension. Verify the member tensile strength. Assume that the gusset plate and bolts are satisfactory.

See example D.6 in reference (2) for calculations.

Results

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yielding $\phi_t P_n$ (kips) [LRFD]	243	243	none	
Tensile rupture $\phi_t P_n$ (kips) [LRFD]	272	272	none	
Tensile yielding P_n/Ω_t (kips) [ASD]	162	162	none	

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile rupture P_n/Ω_t (kips) [ASD]	182	182	none	
Slenderness ratio	248	246.344	negligible

V. AISC 360-05 Bending

To verify the flexural member strength in strong-axis bending of an I section for both LRFD and ASD methods per the AISC 360-05 code.

Details

Verify the Flexural Member Strength in Strong- Axis Bending by both LRFD and ASD method with ASTM A992 W18X50 beam with a simple span of 35 feet. The nominal loads are a uniform dead load of 0.45 kip/ft and a uniform live load of 0.75 kip/ft. Assuming the beam is continuously braced.

Validation

ASTM A992: $F_y = 50\ ksi$, $F_u = 65\ ksi$

Calculate the required flexural strength:

LRFD

$$w_u = 1.2(0.450\text{ kip/ft}) + 1.6(0.750\text{ kip/ft}) = 1.74\text{ kip/ft}$$

$$M_u = \frac{1.74\text{kip/ft}\left(35.0\text{ft}^2\right)}{8} = 266\text{kip}\cdot\text{ft}$$

ASD

$$w_a = 0.450\text{ kip/ft} + 0.750\text{ kip/ft} = 1.20\text{ kip/ft}$$

$$M_a = \frac{1.20\text{kip/ft}\left(35.0\text{ft}^2\right)}{8} = 184\text{kip}\cdot\text{ft}$$

Per the User Note in section F-2 of ref 2 (p.16.1-47), the W18X50 section is compact. Since the beam is continuously braced and compact, only the yielding limit state applies.

Tip: Per Table 3-2 of ref. 2 (p.3-17), the W18X50 is *not* the most efficient shape for this individual beam. This example follows that given in ref 1. STAAD.Pro will select a lighter beam if the member selection command is used.

LRFD

$$\phi_b M_n = \phi_b M_{px} = 0.9\times (101\text{ in}^3 \times 50\text{ ksi})(1\text{ ft}/12\text{ in}) = 379\text{ ft}\cdot\text{kip} > 266\text{ ft}\cdot\text{kip}$$

ASD

$$M_n/\Omega_b = M_{px}/\Omega_b = (101\text{ in}^3 \times 50\text{ ksi})(1\text{ ft}/12\text{ in}) / 1.67 = 252\text{ ft}\cdot\text{kip} > 180\text{ ft}\cdot\text{kip}$$

Results

Table 758: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (kips) [LRFD]	379	379	none	
M_n/Ω_b (kips) [ASD]	252	252	none

V. AISC 360-05 Compression

Verify the axial compression capacity for a the y-y axis of an I section for both the LRFD and ASD methods per the AISC 360-05 code.

References

1. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, page E-4. Example E.1a

Related Links

- *D1.A.5.2 Axial Compression* (on page 1093)

Details

The column is 30 ft long, pinned top and bottom in both axis.

The section is an ASTM A992 (Fy = 50 ksi) W-shape column to carry an axial dead load of 140 kips and live load of 420 kips. The column is 30 feet long

Validation

Calculate the required strength.

LRFD:

$$P_u = 1.2(140 \text{ kips}) + 1.6(420 \text{ kips}) = 840 \text{ kips}$$

ASD:

$$P_a = 140 \text{ kips} + 420 \text{ kips} = 560 \text{ kips}$$

For a pinned-pinned condition, K = 1.0 (Table C-C2.2 of ref. 2). Because the unbraced length is equal about both x-x and y-y directions, y-y axis buckling governs.

Use Table 4-1 in ref 2 and select a W14x132 ($KLy = 30\ ft$). From this table:

$$\phi_c P_n = 892 \text{ kips} > 840 \text{ kips}$$

$$P_n/\Omega_c = 594 \text{ kips} > 560 \text{ kips}$$

Results

Table 759: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	892	893	negligible	
P_n/Ω_c (kips) [ASD]	594	594	none	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 Compression.STD` is typically installed with the program.

V. AISC 360-05 Tension

Verify the tensile yield strength and tensile rupture strength of an I section using both the LRFD and ASD methods per the AISC 360-05 code.

Details

Verify the member Tensile Yield strength and Tensile Rupture Strength by both LRFD and ASD with the bolted end connection of a I Section (W8X21) using the LRFD and ASD method

Steel Gr. ASTM A992.

The connection consists of 2 rows of 4- 3/4"Ø bolts in each flange (16 bolts total) in standard holes. The holes are spaced evenly at 3" on center, with a 1-1/4" edge to center at the end of the flange in line with the tensile force.

Validation

ASTM A992: $F_y = 50\ ksi$, $F_u = 65\ ksi$

Assume a W8X21 section:

$A_g = 6.16\ in^2$
$b_f = 5.27\ in$
$t_f = 0.400\ in$
$d = 8.28\ in$
$r_y = 1.26\ in$
$y = 0.831\ in$ (for a WT4X10.5)

Calculate the required tensile strength.

LRFD

$$P_u = 1.2(30\text{ kips}) + 1.6(90\text{ kips}) = 180\text{ kips}$$

ASD

$$P_a = 30\text{ kips} + 90\text{ kips} = 120\text{ kips}$$

Check the tensile yield strength limit state using tabulated values per Table 5-1 in ref. 2:

$$\phi_t P_n = 277\text{ kips} > 180\text{ kips}$$

$$P_n/\Omega_t = 184\text{ kips} > 120\text{ kips}$$

Check the available tensile rupture strength at the end connection. The tabulated values are for $A_e/A_g \geq 0.75$. Verify this assumption is applicable.

Calculate U as the larger of the values from Table D3.1 case 2 or case 7 (ref. 2).

Case 2 - Check as two WT shapes:

$$U = 1 - x/l = 1 - 0.831\text{ in} / 9.0\text{ in} = 0.908$$

where

l	=	length of the bolted connection = $3x\ 3.0\ in = 9.0\ in$
x	=	distance from the flange face to the plastic neutral axis. This is taken from Table 1-8 of ref. 2.

Case 7

$$b_f = 5.27\text{ in} < 2/3d = 2/3(8.28\text{ in}) = 5.52\text{ in};\ U = 0.85$$

Use U = 0.908

Calculate the net area at the bolted connection:

$$A_n = A_g - 4(Ø_h + 1/16\text{ in})t_f = 6.16\text{ in}^2 - 4\times(13/16\text{ in} + 1/16\text{ in})(0.400\text{ in}) = 4.76\text{ in}^2$$

Calculate the effective area:

$$A_e = A_nU = 4.76\text{ in}^2 \times 0.908 = 4.32\text{ in}^2$$

$$A_e/A_g = 4.32\text{ in}^2/ 6.16\text{ in}^2 = 0.701 < 0.75$$

Therefore, the tabulated values for rupture do not apply. Calculate the rupture strength:

$$P_n = F_u A_e = 65 \text{ ksi } (4.32 \text{ in}^2) = 281 \text{ kips}$$

LRFD

$$\phi_t P_n = 0.75(281 \text{ kips}) = 211 \text{ kips} > 180 \text{ kips}$$

ASD

$$P_n/\Omega_t = 281 \text{ kips}/2.00 = 141 \text{ kips} > 120 \text{ kips}$$

Results

Table 760: Comparison of results

Parameter		Hand Calculation	STAAD.Pro	Difference	Comments
$\phi_t P_n$ (kips) [LRFD]	Yield	277	277	none	
	Rupture	211	211	none	
P_n/Ω_t (kips) [ASD]	Yield	184	184	none	
	Rupture	141	141	none

Details

From reference (2):

A 2L4×4×2 (3/8-in. separation), ASTM A36, has one line of (8) ¾-in. diameter bolts in standard holes and is 25 ft in length. The double angle is carrying a dead load of 40 kips and a live load of 120 kips in tension. Verify the strength by both LRFD and ASD.

Validation

Refer to reference.

Results

Table 761: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yielding $\phi_t P_n$ (kips) [LRFD]	243	243	none	
Tensile rupture $\phi_t P_n$ (kips) [LRFD]	272	272	none	
Tensile yielding P_n / Ω_t (kips) [ASD]	162	162	none	
Tensile rupture P_n / Ω_t (kips) [ASD]	182	182	none	
Slenderness ratio	248	246.344	negligible

V. AISC 360-05 Angle Section D-2

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example D.2, pp. D-4,5

Details

From reference (2):

> Verify, by both ASD and LRFD, the strength of an L4×4×½, ASTM A36, with one line of (4) ¾ in. diameter bolts in standard holes. The member carries a dead load of 20 kips and a live load of 60 kips in tension. Calculate at what length this tension member would cease to satisfy the recommended slenderness limit.

Validation

Refer to reference.

Results

Table 762: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yielding $\phi_t P_n$ (kips) [LRFD]	122	122	none	
Tensile rupture $\phi_t P_n$ (kips) [LRFD]	125	125	none	
Tensile yielding P_n / Ω_t (kips) [ASD]	80.8	80.8	none	
Tensile rupture P_n / Ω_t (kips) [ASD]	83.5	83.5	none

V. AISC 360-05 Built Up I E 12

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example E.12, pp.E-44 - E-47

Details

From reference (2):

> Compute the available strength of a built-up compression member with a length of 14 ft. The ends are pinned. The outside flange is PL3/4×5, the inside flange is PL3/4×8, and the web is PL3/8×10½. Material is ASTM A572 Grade 50.

Validation

Material Properties

$$F_y = 50 \text{ ksi}$$

$$F_u = 65 \text{ ksi}$$

Section Properties

Built-up section properties (ignoring fillet welds):

$$A_g = 8.0(0.75) + 10.5(0.375) + 5.0(0.75) = 13.7 \text{ in}^2$$

$$\bar{y} = \frac{\Sigma A_i y_i}{\Sigma A_i} = \frac{6.0(11.6) + 3.94(6.0) + 3.75(0.375)}{6.0 + 3.94 + 3.75} = 6.91 \text{ in}$$

where $\bar{y}$ is measured from the bottom of the outside flange.

$$I_x = \left[8.0(0.75)(4.72)^2 + \frac{8.0(0.75)^3}{12}\right] + \left[0.375(10.5)(0.910)^2 + \frac{0.375(10.5)^3}{12}\right] + \left[5.0(0.75)(6.54)^2 + \frac{5.0(0.75)^3}{12}\right] =$$

$$I_y = \frac{0.75 \times 8.0^3}{12} + \frac{10.5 \times 0.375^3}{12} + \frac{0.75 \times 5.0^3}{12} = 39.9 \text{ in}^4$$

$$r_x = \sqrt{\frac{I_x}{A}} = \sqrt{\frac{334}{13.7}} = 4.94 \text{ in}$$

$$r_y = \sqrt{\frac{I_y}{A}} = \sqrt{\frac{39.9}{13.7}} = 1.71 \text{ in}$$

From Eq. 3.4 in Reference 3:

$$J = \Sigma\frac{bt^3}{3} = \frac{8.0(0.75)^3 + 10.5(0.375)^3 + 5.0(0.75)^3}{3} = 2.01 \text{ in}^4$$

Distance between flange centroids:

$$h_0 = 12.0 - \frac{0.75}{2} - \frac{0.75}{2} = 11.3 \text{ in}$$

$$C_w = \frac{t_f h_o^2}{12}\left(\frac{b_1^3 b_2^3}{b_1^3 + b_2^3}\right) = \frac{0.75(11.3)^2}{12}\left[\frac{(8.0)^3(5.0)^3}{(8.0)^3 + (5.0)^3}\right] = 802 \text{ in}^6$$

Due to symmetry about the y-axis, the shear center lies on the y axis ($x_0 = 0$). The distance from the centroid to the shear center can be calculated by finding the shear center from outside flange plus one-half the outside flange and then subtracting the centroid distance from that same reference point.

$$y_0 = \left(e + \frac{t_f}{2}\right) - \bar{y} = h_0\left[\frac{b_1^3}{b_1^3 + b_2^3}\right] + \frac{t_f}{2} - \bar{y} = 11.3\left[\frac{(8.0)^3}{(8.0)^3 + (5.0)^3}\right] + \frac{0.75}{2} - 6.91 = 2.55 \text{ in}$$

$$\bar{r}_0^2 = x_0^2 + y_0^2 + \frac{I_x + I_y}{A_g} = 0 + (2.55)^2 + \frac{344 + 39.9}{13.7} = 33.8 \text{ in}^2$$

$$H = 1 - \frac{x_0^2 + y_0^2}{\bar{r}_0^2} = 1 - \frac{0 + (2.55)^2}{33.8} = 0.808$$

<u>Elastic Flexural Buckling Stress</u>

Per Table C-A-7.1 in Reference 1, $K = 1.0$ for pinned-pinned columns. Since the unbraced length is the same both directions, by inspection the y-y axis governs.

$$\frac{K_y L}{r_y} = \frac{1.0(14.0)(12)}{1.71} = 98.2$$

$$F_{ey} = \frac{\pi^2 E}{(KL/r_y)^2} = \frac{\pi^2 29,000}{(98.2)^2} = 29.7 \text{ ksi} \qquad \text{(Eq. E4-8)}$$

$$F_{ez} = \left[\frac{\pi^2 E C_w}{(K_z L)^2} + GJ\right]\left(\frac{1}{A_g \bar{r}_0^2}\right) = \left[\frac{\pi^2(29,000)(802)}{(1.0 \times 14.0 \times 12)^2} + 11,200(2.01)\right]\left(\frac{1}{13.7 \times 33.8}\right) = 66.2 \text{ ksi} \qquad \text{(Eq. E4-9)}$$

$$F_e = \left(\frac{F_{ey} + F_{ez}}{2H}\right)\left[1 - \sqrt{1 - \frac{4F_{ey}F_{ez}H}{(F_{ey} + F_{ez})^2}}\right] = \left(\frac{29.7 + 66.2}{2 \times 0.808}\right)\left[1 - \sqrt{1 - \frac{4(29.7)(66.2)(0.808)}{(29.7 + 66.2)^2}}\right] = 26.4 \text{ ksi} \qquad \text{(Eq. E4-5)}$$

<u>Nominal Compressive Strength</u>

$$\frac{F_y}{2.25} = \frac{50}{2.25} = 22.2 \text{ ksi} < 26.4 \text{ ksi}$$

$$F_{cr} = \left(0.658^{F_y/F_e}\right)F_y = \left[0.658^{(50)/(26.4)}\right]50 = 22.6 \text{ ksi} \qquad \text{(Eq E7-2)}$$

$$P_n = F_{cr}A_g = 22.6(13.7) = 310 \text{ kips} \quad \text{(Eq E7-1)}$$

The available compressive strength:

LRFD: $\phi_c P_n = 0.90(310) = 279 \; kips$

ASD: $P_n / \Omega_c = {}^{310}/_{1.67} = 186 \; kips$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	279	278	negligible	
P_n/Ω_c (kips) [ASD]	186	185	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 Built Up I E 12.STD` is typically installed with the program.

V. AISC 360-05 Built up I E.2

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example E.2, pp.E-10 - E-13

Details

From reference (2):

> Verify that a built-up, ASTM A572 grade 50, column with PL1in.×8in. flanges and a PL1/4in.×15in. web is sufficient to carry a dead load of 70 kips and live load of 210 kips in axial compression. The column length is 15 ft and the ends are pinned in both axes.

Validation

Ultimate load:

$$P_u = 1.2(70\text{ kips}) + 1.6(210\text{ kips}) = 420\text{ kips}$$

Service load:

$$P_a = 70\text{ kips} + 210\text{ kips} = 280\text{ kips}$$

<u>Section Properties</u>

Built-up section properties (ignoring fillet welds):

$$A = 2(8.0)(1.0) + 15.0(0.25) = 19.8\text{ in}^2$$

$$I_x = \Sigma Ad^2 + \Sigma\frac{bh^3}{12} = 2\left[8(8.0)^2 + \frac{8.0(1.0)^3}{12}\right] + \frac{0.25(15.0)^3}{12} = 1,\ 100\text{ in}^4$$

$$I_y = 2\left(\frac{1.0 \times 8.0^3}{12}\right) + \frac{15.0 \times 0.25^3}{12} = 85.4\text{ in}^4$$

$$r_y = \sqrt{\frac{I_y}{A}} = \sqrt{\frac{85.4}{19.8}} = 2.08\text{ in}$$

<u>Elastic Flexural Buckling Stress</u>

Per Table C-A-7.1 in Reference 1, $K = 1.0$ for pinned-pinned columns. Since the unbraced length is the same both directions, by inspection the y-y axis governs.

$$\frac{KL}{r_y} = \frac{1.0(15.0)(12)}{2.08} = 86.5$$

$$F_e = \frac{\pi^2 E}{(KL\ /r)^2} = \frac{\pi^2 29,\ 000}{(86.5)^2} = 38.3\text{ ksi} \qquad \text{(Eq. E3-4)}$$

<u>Slenderness</u>

Check for slender flanges and then determine the unstiffened element (flange) reduction factor.

$$k_c = \frac{4}{\sqrt{h\ /t_w}} = \frac{4}{\sqrt{15.0/0.25}} = 0.516 \qquad \text{(Table B4.1b note a)}$$

$0.35 < k_c < 0.76$

Flange slenderness:

$$\lambda = \frac{b}{t} = \frac{4.0}{1.0} = 4.0$$

The limiting flange slenderness ratio, λ_r:

$$\lambda_r = 0.64\sqrt{\frac{k_c E}{F_y}} = 0.64\sqrt{\frac{0.516(29,\ 000)}{50}} = 11.1 > \lambda \qquad \text{(Table B4.1a, case 2)}$$

Thus, the flanges are not slender and there is no reduction ($Q_s = 1.0$).

Check for slender web and then determine the stiffened element (web) reduction factor.

Web slenderness:

$$\lambda = \frac{h}{t} = \frac{15.0}{0.25} = 60.0$$

The limiting web slenderness ratio, λ_r:

$$\lambda_r = 1.49\sqrt{\frac{E}{F_y}} = 1.49\sqrt{\frac{29,\ 000}{50}} = 35.9 < \lambda \qquad \text{(Table B4.1a, case 5)}$$

Thus, the web is slender.

$$Q_a = \frac{A_e}{A_g} \qquad \text{(Eq. E7-16)}$$

where

A_e	=	the effective area based on the reduced effective width, b_e
b_e	=	$1.92t\sqrt{\frac{E}{f}}\left[1 - \frac{0.34}{(b\ /\ t)}\sqrt{\frac{E}{f}}\right] \leq b$ (Eq. E7-17)
f	=	F_{cr} calculated based on $Q = 1.0$
F_{cr}	=	$Q\left(0.658^{QF_y/F_e}\right)F_y = 1.0\left[0.658^{1.0(50)/(38.3)}\right]50 = 29.0\ ksi$ because $\frac{KL}{r} = 86.5 < 4.71\sqrt{\frac{E}{QF_y}} = 4.71\sqrt{\frac{29,\ 000}{1.0(50)}} = 113$

$$b_e = 1.92(0.25)\sqrt{\frac{29,\ 000}{29.0}}\left[1 - \frac{0.34}{(15/0.25)}\sqrt{\frac{29,\ 000}{29.0}}\right] = 12.5 \text{ in} < 15 \text{ in}$$

$$A_e = b_e t_w + 2b_f t_f = 12.5(0.25) + 2(8.0)(1.0) = 19.1 \text{ in}^2$$

$$Q_a = \frac{19.1}{19.8} = 0.965$$

$$Q = Q_s Q_a = 1.0 \times 0.965 = 0.965$$

$$\frac{KL}{r} = 86.5 < 4.71\sqrt{\frac{E}{QF_y}} = 4.71\sqrt{\frac{29,\ 000}{0.965(50)}} = 115$$

$$F_{cr} = Q\left(0.658^{QF_y/F_e}\right)F_y = 0.965\left[0.658^{0.965(50)/(38.3)}\right]50 = 28.5 \text{ ksi}$$

<u>Nominal Compressive Strength</u>

$$P_n = F_{cr}A_g = 28.5(19.8) = 564 \text{ kips} \qquad \text{(Eq E7-1)}$$

The available compressive strength:

LRFD: $\phi_c P_n = 0.90(564) = 508\ kips$

ASD: $P_n / \Omega_c = {}^{564}\!/_{1.67} = 338\ kips$

Table 763: Comparison of results

Result Type	Reference	STAAD.Pro	Difference
$\phi_c P_n$ (kips) [LRFD]	508	513	1.0%
P_n / Ω_c (kips) [ASD]	338	341	0.9%

Details

From reference (2):

> Determine if a built-up, ASTM A572 grade 50 column with PL3/8 in.×102 in. flanges and a PL1/4 in.×7 1/4 in. web has sufficient available strength to carry a dead load of 40 kips and a live load of 120 kips in axial compression. The column unbraced length is 15 ft in both axes and the ends are pinned.

Validation

Ultimate load:

$$P_u = 1.2(40\text{ kips}) + 1.6(120\text{ kips}) = 240\text{ kips}$$

Service load:

$$P_a = 40\text{ kips} + 120\text{ kips} = 160\text{ kips}$$

Section Properties

Built-up section properties (ignoring fillet welds):

$$A_g = 2(10.5)(0.375) + 7.25(0.25) = 9.69\text{ in}^2$$

$$I_x = \Sigma A d^2 + \Sigma \frac{bh^3}{12} = 2\left[10.5 \times 0.375(3.81)^2 + \frac{10.5(0.25)^3}{12}\right] + \frac{0.25(7.25)^3}{12} = 122\text{ in}^4$$

$$I_y = 2\left(\frac{0.375 \times 10.5^3}{12}\right) + \frac{7.25 \times 0.25^3}{12} = 72.4\text{ in}^4$$

$$r_y = \sqrt{\frac{I_y}{A}} = \sqrt{\frac{72.4}{9.69}} = 2.73\text{ in}$$

From the User Note in Section E4 of Reference 1:

$$C_w = \frac{I_y h_o^2}{4} = \frac{72.4(7.63)^2}{4} = 1,050\text{ in}^6$$

From Eq. 3.4 in Reference 3:

$$J = \Sigma \frac{bt^3}{3} = \frac{2(10.5)(0.375)^3 + 7.25(0.25)^3}{3} = 0.407\text{ in}^4$$

Slenderness

Check for slender web and then determine the stiffened element (web) reduction factor.

Web slenderness:

$$\lambda = \frac{h}{t} = \frac{7.25}{0.25} = 29.0$$

The limiting web slenderness ratio, λ_r:

$$\lambda_r = 1.49\sqrt{\frac{E}{F_y}} = 1.49\sqrt{\frac{29,000}{50}} = 35.9 > \lambda \qquad \text{(Table B4.1a, case 5)}$$

Thus, the web is not slender and there is no reduction (i.e., Q_a *1.0)*

Check for slender flanges and then determine the unstiffened element (flange) reduction factor.

$$k_c = \frac{4}{\sqrt{h/t_w}} = \frac{4}{\sqrt{7.25/0.25}} = 0.743 \qquad \text{(Table B4.1b note a)}$$

$0.35 < k_c < 0.76$, OK.

Flange slenderness:

$$\lambda = \frac{b}{t} = \frac{5.25}{0.375} = 14.0$$

The limiting flange slenderness ratio, λ_r:

$$\lambda_r = 0.64\sqrt{\frac{k_c E}{F_y}} = 0.64\sqrt{\frac{0.743(29,000)}{50}} = 13.3 < \lambda \qquad \text{(Table B4.1a, case 2)}$$

Thus, the flanges are slender.

$$0.64\sqrt{\frac{k_c E}{F_y}} = 13.3 < \frac{b}{t} = 14.0 < 1.17\sqrt{\frac{k_c E}{F_y}} = 1.17\sqrt{\frac{0.743(29,\ 000)}{50}} = 24.3$$

$$Q_s = 1.415 - 0.65\left(\frac{b}{t}\right)\sqrt{\frac{F_y}{k_c E}} = 1.415 - 0.65(14.0)\sqrt{\frac{50}{0.743(29,\ 000)}} = 0.977 \quad \text{(Eq. E7-8)}$$

$$Q = Q_s Q_a = 0.977(1.0) = 0.977$$

Elastic Flexural Buckling Stress

Per Table C-A-7.1 in Reference 1, $K = 1.0$ for pinned-pinned columns. Since the unbraced length is the same both directions, by inspection the y-y axis governs.

$$\frac{K_y L}{r_y} = \frac{1.0(15.0)(12)}{2.73} = 65.9$$

$$F_e = \frac{\pi^2 E}{(KL\ / r)^2} = \frac{\pi^2 29,\ 000}{(65.9)^2} = 65.9 \text{ ksi} \quad \text{(Eq. E3-4)}$$

Nominal Compressive Strength

$$\frac{KL}{r} = 65.9 < 4.71\sqrt{\frac{E}{QF_y}} = 4.71\sqrt{\frac{29,\ 000}{0.977(50)}} = 115$$

$$F_{cr} = Q\left(0.658^{QF_y/F_e}\right)F_y = 0.977\left[0.658^{0.977(50)/(65.9)}\right]50 = 35.8 \text{ ksi} \quad \text{(Eq E7-2)}$$

$$P_n = F_{cr}A_g = 35.8(6.69) = 347 \text{ kips} \quad \text{(Eq E7-1)}$$

The available compressive strength:

LRFD: $\phi_c P_n = 0.90(347) = 312\ kips$

ASD: $P_n\ /\ \Omega_c = {}^{347}\!/_{1.67} = 208\ kips$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	312	314	negligible	
P_n/Ω_c (kips) [ASD]	208	209	negligible	
Slenderness ratio	65.9	65.86	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 Built up I E.STD` is typically installed with the program.

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F.2-1a, p.F-15

Details

From reference (2):

> Select an ASTM A36 channel to serve as a roof edge beam with a simple span of 25 ft. Limit the live load deflection to L/360. The nominal loads are a uniform dead load of 0.23 kip/ft and a uniform live load of 0.69 kip/ft. The beam is continuously braced.

Validation

Ultimate moment:

$$w_u = 1.2(0.23 \text{ k/ft}) + 1.6(0.69 \text{ k/ft}) = 1.38 \text{ k/ft}$$

$$M_u = \frac{1.38(25)^2}{8} = 108 \text{ ft-k}$$

Service moment:

$$w_a = 0.23 \text{ k/ft} + 0.69 \text{ k/ft} = 0.92 \text{ k/ft}$$

$$M_a = \frac{0.92(25)^2}{8} = 71.9 \text{ ft-k}$$

Try a C15×33.9, which has a plastic section modulus, $Z_x = 50.8\ in^3$.

All ASTM A36 grade C-shapes are compact. The member is continuously braced, so therefore the yielding limit state governs.

$$M_n = M_p = F_y \times Z_x = 36 \times 50.8 = 1{,}830 \text{ in-k} = 152 \text{ ft-k}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(152) = 137\ ft\text{-}k$

ASD: $M_n \big/ \Omega_b = {}^{152}\!\big/_{1.67} = 91.0\ ft\text{-}k$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	137	137	none	
M_n/Ω_b (ft·k) [ASD]	91	91.3	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 C Flex Mem F.STD` is typically installed with the program.

V. AISC 360-05 C LTB Test F.2-2

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F.2-2, pp.F-16 - F-19

Details

From reference (2):

> Check the C15×33.9 beam selected in V. AISC 360-05 C Flex Mem F.2-1 (on page 5441), assuming it is braced at the ends and the fifth points rather than continuously braced.

Validation

Ultimate moment:

$$w_u = 1.2(0.23\text{ k/ft}) + 1.6(0.69\text{ k/ft}) = 1.38\text{ k/ft}$$

$$M_u = \frac{1.38(25)^2}{8} = 108 \text{ ft-k}$$

Service moment:

$$w_a = 0.23 \text{ k/ft} + 0.69 \text{ k/ft} = 0.92 \text{ k/ft}$$

$$M_a = \frac{0.92(25)^2}{8} = 71.9 \text{ ft-k}$$

The unbraced length, >$L_b = 5\ ft$.

Try a C15×33.9, which has a plastic section modulus, $Z_x = 50.8\ in^3$.

The lateral-torsional buckling modification factor, $C_b = 1.0$ for the center span of this bracing & loading condition.

$$L_p = 1.76 r_y \sqrt{\frac{E}{F_y}} = 1.76(0.901)\sqrt{\frac{29,000}{36}}\left(\frac{1}{12}\right) = 3.75\text{ft} \quad \text{(F2-5)}$$

$$L_r = \pi r_{ts} \sqrt{\frac{E}{0.7F_y}} = \pi(1.13)\sqrt{\frac{29,000}{0.7 \times 36}}\left(\frac{1}{12}\right) = 10.0 \text{ ft} \quad \text{(F2-6)}$$

Note: This is the simplified, conservative calculation for L_r per the User Note used to verify that the section is in the plastic-elastic range. The reference uses the more exact calculation but the resulting flexural strength values are essentially equal.

$$L_p < L_b \leq L_r$$

All ASTM A36 grade C-shapes are compact.

The nominal flexural strength for the flexural yielding limit state is:

$$M_n = M_p = F_y \times Z_x = 36 \times 50.8 = 1{,}830 \text{ in-k} = 152 \text{ ft-k}$$

The nominal flexural strength for the lateral-torsional buckling limit state is:

$$M_n = C_b\left[M_p - (M_p - 0.7F_y S_x)\left(\frac{L_b - L_p}{L_r - L_p}\right)\right]$$

$$= 1.0\left[1,830 - (1,830 - 0.7 \times 36 \times 42)\left(\frac{5 - 3.75}{10 - 3.75}\right)\right]\left(\frac{1}{12}\right) = 145 \text{ ft-k}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(145) = 131\ ft\text{-}k$

ASD: $M_n / \Omega_b = {}^{131}/_{1.67} = 86.8\ ft\text{-}k$

Table 764: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (kips) [LRFD]	131	130	negligible	
M_n/Ω_b (kips) [ASD]	86.8	86.7	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 C LTB Test F.STD` is typically installed with the program.

V. AISC 360-05 C Strong Axis Shear G.2

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example G.2, pp.G-5,6

Details

From reference (2):

> Verify the shear strength of a C15×33.9 channel with end shears of 17.5 kips from dead load and 52.5 kips from live load.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	117	117	none	
V_n/Ω_v (kips) [ASD]	77.8	77.6	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 C Strong Axis Shear G.STD` is typically installed with the program.

V. AISC 360-05 C Weak Axis Shear G.7

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005

2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example G.7, p.G-12

Details

From reference (2):

> Verify the strength of a C9×20 ASTM A36 channel with end shears of 5 kips from dead load and 15 kips from live load in the weak direction.

Validation

Ultimate load:

$$V_u = 1.2(5.0\text{ kips}) + 1.6(15.0\text{ kips}) = 30.0\text{ kips}$$

Service load:

$$V_a = 5.0\text{ kips} + 15.0\text{ kips} = 20.0\text{ kips}$$

Area of the flanges for shear:

$$A_w = 2b_f t_f = 2(2.65)(0.413) = 2.19\text{ in}^2$$

Section G2.1 of Reference 1 gives $k_v = 1.2$.

$$\frac{b_f}{t_f} = \frac{2.65}{0.413} = 6.42 < 1.10\sqrt{\frac{k_v E}{F_y}} = 1.10\sqrt{\frac{1.2(29,\ 000)}{36}} = 34.2$$

Therefore, $C_v = 1.0$.

<u>Nominal Shear Strength</u>

$$V_n = 0.6F_y A_w C_v = 0.6(36)(2.19)(1.0) = 47.3\text{ kips} \qquad \text{(Eq. G2-1)}$$

The available shear strength:

LRFD: $\phi_v V_n = 0.90(47.3) = 42.6\ kips$

ASD: $V_n / \Omega_v = {}^{47.3}/_{1.67} = 28.3\ kips$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	42.6	42.6	none	
V_n / Ω_v (kips) [ASD]	28.3	28.3	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 C Weak Axis Shear G.STD` is typically installed with the program.

V. AISC 360-05 Double L E.5

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example E.5, pp.E-22 - E-25

Details

From reference (2):

> Verify the strength of a 2L4×3 1/2×3/8 LLBB (3/4-in. separation) strut with a length of 8 ft and pinned ends carrying an axial dead load of 20 kips and live load of 60 kips. Also, calculate the required number of fully tightened or welded intermediate connectors required.

Validation

Refer to reference.

Table 765: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	127	127	none	
P_n / Ω_c (kips) [ASD]	85.0	84.6	negligible

V. AISC 360-05 Double L E.6

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example E.6, pp.E-26 - E-30

Details

From reference (2):

> Determine if a 2L5×3×1/4 LLBB (3/4-in. separation) strut with a length of 8 ft and pinned ends has sufficient available strength to support a dead load of 10 kips and live load of 30 kips in axial compression. Also, calculate the required number of fully tightened or welded intermediate connectors.

Validation

Ultimate load:

$$P_u = 1.2(10\text{ kips}) + 1.6(30\text{ kips}) = 60\text{ kips}$$

Service load:

$$P_a = 10\text{ kips} + 30\text{ kips} = 40\text{ kips}$$

Per Table C-A-7.1 in Reference 1, $K = 1.0$ for pinned-pinned columns. Since the unbraced length is the same both directions, by inspection the y-y axis governs.

Slenderness

$$\lambda = \frac{b}{t} = \frac{5.0}{0.25} = 20.0$$

The limiting slenderness ratio, λ_r:

$$\lambda_r = 0.45\sqrt{\frac{E}{F_y}} = 0.45\sqrt{\frac{29,000}{36}} = 12.8 < \lambda \qquad \text{(Table B4.1a, case 3)}$$

Thus, the outstanding legs are slender.

Check for slender web and then determine the stiffened element (web) reduction factor.

$$0.45\sqrt{\frac{E}{F_y}} = 12.8 < \frac{b}{t} = 20.0 < 0.91\sqrt{\frac{E}{F_y}} = 0.91\sqrt{\frac{29,000}{36}} = 25.8$$

$$Q_s = 1.34 - 0.76\left(\frac{b}{t}\right)\sqrt{\frac{F_y}{E}} = 1.34 - 0.76(20.0)\sqrt{\frac{36}{29,000}} = 0.804 \qquad \text{(Eq. E7-11)}$$

$$Q = Q_s Q_a = 0.804(1.0) = 0.804$$

$$F_{cr} = Q\left(0.658^{QF_y/F_e}\right)F_y$$

where

F_e	=	$\left(\frac{F_{ey}+F_{ez}}{2H}\right)\left[1-\sqrt{1-\frac{4F_{ey}F_{ez}H}{(F_{ey}+F_{ez})^2}}\right]$ (Eq E4-5)
K_i	=	0.5 for angles back-to-back
r_i	=	$r_z = 0.652\ in$; the radius of gyration for a single angle
a	=	32 in spacing between connectors (using the bolts at 1/3 points from Reference 2)
$\left(\frac{K_yL}{r_y}\right)_m$	=	$\sqrt{\left(\frac{KL}{r}\right)_0^2+\left(\frac{K_ia}{r_i}\right)^2} = \sqrt{\left(\frac{1.0\times 96}{1.33}\right)^2+\left(\frac{0.5\times 32}{0.652}\right)^2} = 76.3$ for $\frac{a}{r_i} = \frac{32\ in}{0.652\ in} = 49.1 > 40$
F_{ey}	=	$\frac{\pi^2E}{\left(\frac{K_yL}{r_y}\right)_m^2} = \frac{\pi^2(29,\ 000)}{(76.3)^2} = 49.2\ ksi$
F_{ez}	=	$\frac{GJ}{A_g\bar{r}_0^2} = \frac{11,\ 200(0.04328)\times 2\ angles}{3.88(2.59)^2} = 37.7\ ksi$

Thus, $\left(\frac{49.2+37.7}{2\times 0.657}\right)\left[1-\sqrt{1-\frac{4(49.2)(37.7)(0.657)}{(49.2+37.7)^2}}\right] = 26.8\ ksi$

Nominal Compressive Strength

$$\frac{QF_y}{2.25} = \frac{0.804(36)}{2.25} = 12.9\text{ ksi} < 26.8\text{ ksi}$$

$$F_{cr} = Q\left(0.658^{QF_y/F_e}\right)F_y = 0.804\left[0.658^{0.804(36)/(26.8)}\right]36 = 18.4\text{ ksi} \quad \text{(Eq E7-2)}$$

$$P_n = F_{cr}A_g = 18.4(3.88) = 71.4\text{ kips} \quad \text{(Eq E7-1)}$$

The available compressive strength:

LRFD: $\phi_cP_n = 0.90(71.4) = 64.3\ kips$

ASD: $P_n\ /\ \Omega_c = {}^{71.4}\!/_{1.67} = 42.8\ kips$

Result Type	Reference	STAAD.Pro	Difference	Comments
ϕ_cP_n (kips) [LRFD]	64.3	63.8	negligible	
P_n/Ω_c (kips) [ASD]	42.8	42.4	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 Double L E.STD` is typically installed with the program.

V. AISC 360-05 F.1-3 LTB I Section

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F1-3, pp.F-11 - F-14

Details

From reference (2):

> Verify the strength of the W18×50 beam selected in Example F.1-1a if the beam is braced at the ends and center point rather than continuously braced.

From Example F1-1a (also found in Reference (1)):

> Select an ASTM A992 W-shape beam with a simple span of 35 feet. Limit the member to a maximum nominal depth of 18 in. Limit the live load deflection to L/360. The nominal loads are a uniform dead load of 0.45 kip/ft and a uniform live load of 0.75 kip/ft.

Validation

Refer to reference.

Table 766: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·kips) [LRFD]	288	288	none	
M_n / Ω_b (ft·kips) [ASD]	192	192	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 F.STD` is typically installed with the program.

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example D.5, pp.D-10,11

Details

From reference (2):

> An HSS6.000×0.500, ASTM A500 grade B, has a length of 30 ft. The member carries a dead load of 40 kips and a live load of 120 kips in tension. Assume the end connection is a fillet welded 1/2 in. thick single concentric gusset plate that has a length of 16 in. Verify the strength by both LRFD and ASD.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yielding $\phi_t P_n$ (kips) [LRFD]	306	306	none	
Tensile rupture $\phi_t P_n$ (kips) [LRFD]	329	329	none	
Tensile yielding P_n / Ω_t (kips) [ASD]	203	203	none	
Tensile rupture P_n / Ω_t (kips) [ASD]	220	220	none	
Slenderness ratio	184	183.316	negligible

V. AISC 360-05 HSSP Shear Capacity G.5

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example G.5, pp.G-9,10

Details

From reference (2):

> Verify the shear strength of a round HSS16.000×0.375 ASTM A500 grade B member spanning 32 feet with end shears of 30 kips from dead load and 90 kips from live load.

Validation

Ultimate load:

$$V_u = 1.2(30.0 \text{ kips}) + 1.6(90.0 \text{ kips}) = 180 \text{ kips}$$

Service load:

$$V_a = 30.0 \text{ kips} + 90.0 \text{ kips} = 120 \text{ kips}$$

Shear Buckling Stress

$$F_{cr} = \max \left| \begin{array}{l} \dfrac{1.60E}{\sqrt{\dfrac{L_v}{D}}\left(\dfrac{D}{t}\right)^{5/4}} = \dfrac{1.60(29,\ 000)}{\sqrt{\dfrac{192}{16.0}}\left(\dfrac{16.0}{0.349}\right)^{5/4}} = 112 \text{ ksi} \\ \dfrac{0.78E}{\left(D/t\right)^{3/2}} = \dfrac{0.78(29,\ 000)}{\left(16.0/0.349\right)^{3/2}} = 72.9 \text{ ksi} \end{array} \right.$$

The maximum permitted value is $F_{cr} \le 0.6F_y = 0.6(42) = 25.2\ ksi$ (governs).

Nominal Shear Strength

$$V_n = F_{cr}A_g / 2 = (25.2)(17.2) / 2 = 217 \text{ kips} \qquad \text{(Eq. G2-1)}$$

The available shear strength:

LRFD: $\phi_v V_n = 0.90(217) = 195\ kips$

ASD: $V_n / \Omega_v = {}^{217}/_{1.67} = 130\ kips$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	195	195	none	
V_n / Ω_v (kips) [ASD]	130	130	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 HSSP Shear Capacity G.STD` is typically installed with the program.

V. AISC 360-05 HSSP Torsional Strength H.5B

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example H.5b, p.H-13

Details

From reference (2):

Determine the available torsional strength of an ASTM A500 Gr. B HSS5.000×0.250 that is 14 ft long.

Validation

Critical Stress

$$F_{cr} = \max \begin{cases} \dfrac{1.23E}{\sqrt{\dfrac{L}{D}}\left(\dfrac{D}{t}\right)^{5/4}} = \dfrac{1.23(29,\ 000)}{\sqrt{\dfrac{14 \times 12}{5.0}}(21.5)^{5/4}} = 133 \text{ ksi} \\ \dfrac{0.60E}{\left(D/t\right)^{3/2}} = \dfrac{0.60(29,\ 000)}{(21.5)^{3/2}} = 175 \text{ ksi} \end{cases}$$

The maximum permitted value is $F_{cr} \leq 0.6F_y = 0.6(42) = 25.2\ ksi$ (governs).

Nominal Torsional Strength

$$T_n = F_{cr}C = 25.2(7.95) = 200 \text{ in}\cdot\text{k} \quad \text{(Eq. G2-1)}$$

The available shear strength:

LRFD: $\phi_T T_n = 0.90(200) = 180\ in \cdot k$

ASD: $T_n / \Omega_T = {}^{200}/_{1.67} = 120\ in \cdot k$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_G T_n$ (in·k) [LRFD]	180	180	none	
G_n/Ω_T (in·k) [ASD]	120	120	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 HSSP Torsional Strength H.STD` is typically installed with the program.

V. AISC 360-05 HSST Compact Flange F.6

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F.6, p.F-27

Details

From reference (2):

> Select a square ASTM A500 Gr. B HSS beam to span 7.5 feet. The nominal loads are a uniform dead load of 0.145 kip/ft and a uniform live load of 0.435 kip/ft. Limit the live load deflection to L/240 . Assume the beam is continuously braced.

Validation

Ultimate moment:

$$w_u = 1.2(0.145 \text{ k/ft}) + 1.6(0.435 \text{ k/ft}) = 0.87 \text{ k/ft}$$

$$M_u = \frac{0.87(7.5)^2}{8} = 6.12 \text{ ft} \cdot \text{k}$$

Service moment:

$$w_a = 0.145 \text{ k/ft} + 0.435 \text{ k/ft} = 0.580 \text{ k/ft}$$

$$M_a = \frac{0.58(7.5)^2}{8} = 4.08 \text{ ft}\cdot\text{k}$$

Calculate the minimum required moment of inertia:

$$\Delta_{max} = \frac{L}{240} = \frac{7.50(12)}{240} = 0.375 \text{ in.}$$

$$I_{req} = \frac{5wl^4}{384E\Delta_{max}} = \frac{5(0.435)(7.5)^4(12)^3}{384(29{,}000)(0.375)} = 2.85 \text{ in.}^4$$ (Ref. 1, Table 3-23, Diagram 1)

Try a HSS 3×3×1/4, which has a plastic section modulus, $I_x = 3.02\ in^4$, $Z_x = 2.48\ in^3$.

The yield strength, $F_y = 46\ ksi$

Flange compactness: $\lambda = b/t = 9.88$

Determine the compact flange ratio limit from Table B4.1b: $\lambda_p = 1.12\sqrt{\frac{E}{F_y}} = 1.12\sqrt{\frac{29{,}000}{46}} = 28.1 > \lambda$

(Compact)

$$M_n = M_p = F_y \times Z_x = 46 \times 2.48 = 114.1 \text{ in-k} = 9.51 \text{ ft-k}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(9.51) = 8.56\ ft\cdot k$

ASD: $M_n / \Omega_b = {}^{9.51}\!/_{1.67} = 5.69\ ft\cdot k$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	8.56	8.56	none	the reference gives a nominally different answer due to rounding
M_n/Ω_b (ft·k) [ASD]	5.69	5.69	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 HSST Compact Flange F.STD` is typically installed with the program.

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example D.4, pp.D-8,9

Details

From reference (2):

> Verify, by LRFD and ASD, the strength of an HSS6×4×3/8, ASTM A500 grade B, with a length of 30 ft. The member is carrying a dead load of 35 kips and a live load of 105 kips in tension. Assume the end connection is fillet welded to a 1/2 in. thick single concentric gusset plate and has a length of 16 in.

Validation

Ultimate load:

$$P_u = 1.2(35\text{ kips}) + 1.6(105\text{ kips}) = 210\text{ kips}$$

Service load:

$$P_a = 35\text{ kips} + 105 = 140\text{ kips}$$

<u>Tensile Yielding</u>

LRFD: $\phi_t P_n = \phi_t A_g F_y = 0.9(6.18)(46) = 256\ kips$

ASD: $P_n \Big/ \Omega_c = \frac{A_g F_y}{\Omega_c} = \frac{(6.18)(46)}{1.67} = 170\ kips$

<u>Tensile Rupture</u>

Determine the shear lag factor for the effective area:

$$A_e = A_n U \qquad \text{(Eq. D3-1)}$$

where

A_n = the net area; in this case allows for a 1/16-in gap in fit-up between the HSS and the gusset plate,

$= A_g - 2(t_p + 1 / 16)t = 6.18 - 2(0.5 + 1 / 16)0.349 = 5.79\ in^2$

$\bar{x}$ = $\frac{B^2 + 2BH}{4(B + H)} = \frac{(4.0)^2 + 2(4.0)(6.0)}{4(4.0 + 6.0)} = 1.60\ in$

U = $1 - \frac{\bar{x}}{l} = 1 - \frac{1.60}{16.0} = 0.90$

$$A_e = 5.79(0.90) = 5.21\text{ in}^2$$

<u>Nominal Tensile Rupture Strength</u>

$$P_n = F_u A_e = 58(5.21) = 302\text{ kips} \qquad \text{(Eq D2-2)}$$

The available tensile strength:

LRFD: $\phi_t P_n = 0.75(302) = 227\ kips$

ASD: $P_n / \Omega_t = {}^{302}\!\big/_{2.00} = 151\ kips$

<u>Slenderness</u>

$$\frac{L}{r} = \frac{30 \times 12}{1.55} = 232$$

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yielding $\phi_t P_n$ (kips) [LRFD]	256	256	none	
Tensile rupture $\phi_t P_n$ (kips) [LRFD]	227	226	negligible	
Tensile yielding P_n/Ω_t (kips) [ASD]	170	170	none	
Tensile rupture P_n/Ω_t (kips) [ASD]	151	151	none	
Slenderness ratio	232	231.848	negligible

V. AISC 360-05 HSST NonCompact Flange F.7

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F.7, pp.F-28 - F-31

Details

From reference (2):

> Select a rectangular ASTM A500 Gr. B HSS beam with a span of 21 ft. The nominal loads include a uniform dead load of 0.15 kip/ft and a uniform live load of 0.40 kip/ft. Limit the live load deflection to L/240. Assume the beam is braced at the end points only.

Validation

Ultimate moment:

$$w_u = 1.2(0.15 \text{ k/ft}) + 1.6(0.4 \text{ k/ft}) = 0.82 \text{ k/ft}$$

$$M_u = \frac{0.82(21)^2}{8} = 45.2 \text{ ft-k}$$

Service moment:

$$w_a = 0.15 \text{ k/ft} + 0.4 \text{ k/ft} = 0.55 \text{ k/ft}$$

$$M_a = \frac{0.55(21)^2}{8} = 30.3 \text{ ft-k}$$

Try a HSS 10×6×3/16, which has a plastic section modulus, $Z_x = 18.0\ in^3$ and a section modulus, $S_x = 14.9\ in^3$.

Flange compactness: $\lambda = b/t = 31.5$

Determine the compact and slender flange ratio limits from Table B4.1b:

$$\lambda_p = 1.12\sqrt{\frac{E}{F_y}} = 1.12\sqrt{\frac{29{,}000}{46}} = 28.1$$

$$\lambda_r = 1.40\sqrt{\frac{E}{F_y}} = 1.40\sqrt{\frac{29{,}000}{46}} = 35.2$$

Thus, the section has a non-compact flange.

Web compactness: $\lambda = h/t = 54.5$

$$\lambda_p = 2.42\sqrt{\frac{E}{F_y}} = 2.42\sqrt{\frac{29{,}000}{46}} = 60.8 > \lambda$$

Thus, the section has a compact web.

$$M_p = F_y \times Z_x = 46 \times 18.0 = 828 \text{ in-k} = 69.0 \text{ ft·k}$$

$$M_n = M_p - (M_p - F_y S)\left(3.57\frac{b}{t}\sqrt{\frac{F_y}{E}} - 4.0\right) \qquad \text{(F7-2)}$$

$$= 828 - (828 - 0.7 \times 46 \times 14.9)\left(3.57 \times 31.5\sqrt{\frac{46}{29{,}000}} - 4.0\right) = 760 \text{ in-k} = 63.3 \text{ ft·k}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(63.3) = 57.0\ ft \cdot k$

ASD: $M_n / \Omega_b = {}^{63.3}\!/_{1.67} = 37.9\ ft \cdot k$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	57.0	57.0	none	
M_n/Ω_b (ft·k) [ASD]	37.9	37.9	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 HSST NonCompact Flange F.STD` is typically installed with the program.

V. AISC 360-05 HSST Shear Capacity G.4

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example G.4, p.G-4

Details

From reference (2):

> Verify the shear strength of a HSS6×4×3/8 ASTM A500 grade B member with end shears of 11 kips from dead load and 33 kips from live load. The beam is oriented with the shear parallel to the 6 in. dimension.

Validation

Ultimate load:

$$V_u = 1.2(11.0 \text{ kips}) + 1.6(33.0 \text{ kips}) = 66.0 \text{ kips}$$

Service load:

$$V_a = 11.0 \text{ kips} + 33.0 \text{ kips} = 44.0 \text{ kips}$$

Area of the web for shear:

Note: The corner radius is taken as 1.5× the design wall thickness per Section B4.1b of Reference 1.

$$\text{h} = \text{H} - 3\text{t} = 6.0 - 3\times 0.349 = 4.95 \text{ in}$$

Section G5 of Reference 1 gives $k_v = 5$.

$$\text{A}_\text{w} = 2\text{ht} = 2(4.95)(0.349) = 3.46 \text{ in}^2$$

$$\frac{h}{t_w} = \frac{4.95}{0.349} = 14.2 < 1.10\sqrt{\frac{k_v E}{F_y}} = 1.10\sqrt{\frac{5(29,\ 000)}{46}} = 61.8$$

Therefore, $C_v = 1.0$.

<u>Nominal Shear Strength</u>

$$V_n = 0.6F_y A_w C_v = 0.6(46)(3.46)(1.0) = 95.5 \text{ kips} \qquad \text{(Eq. G2-1)}$$

The available shear strength:

LRFD: $\phi_v V_n = 0.90(95.5) = 86.0 \text{ kips}$

ASD: $V_n / \Omega_v = {}^{95.5}\!/_{1.67} = 57.2 \text{ kips}$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	86.0	85.9	negligible	
V_n / Ω_v (kips) [ASD]	57.2	57.1	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 HSST Shear Capacity G.STD` is typically installed with the program.

V. AISC 360-05 HSST Slender Flange F.8

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F.8, pp.F-32 - F-34

Details

From reference (2):

> Verify the strength of an ASTM A500 Gr. B HSS8×8×x with a span of 21 ft. The nominal loads are a dead load of 0.125 kip/ft and a live load of 0.375 kip/ft. Limit the live load deflection to L 240 .

Validation

Ultimate moment:

$$w_u = 1.2(0.125 \text{ k/ft}) + 1.6(0.375 \text{ k/ft}) = 0.75 \text{ k/ft}$$

$$M_u = \frac{0.75(21)^2}{8} = 41.3 \text{ ft} \cdot \text{k}$$

Service moment:

$$w_a = 0.125 \text{ k/ft} + 0.375 \text{ k/ft} = 0.50 \text{ k/ft}$$

$$M_a = \frac{0.5(21)^2}{8} = 27.6 \text{ ft} \cdot \text{k}$$

Try a HSS 8×8×3/16, which has a plastic section modulus, $Z_x = 15.7\ in^3$ *and a section modulus,* $S_x = 13.6\ in^3$.

The yield strength, $F_y = 46\ ksi$

Flange compactness: $\lambda = b/t = 43.0$

Determine the slender flange ratio limit from Table B4.1b: $\lambda_r = 1.40\sqrt{\frac{E}{F_y}} = 1.12\sqrt{\frac{29{,}000}{46}} = 35.2 < \lambda$ (Slender)

Web compactness: $\lambda = h/t = 43.0$

$$\lambda_p = 2.42\sqrt{\frac{E}{F_y}} = 2.42\sqrt{\frac{29{,}000}{46}} = 60.8 > \lambda$$

Thus, the section has a compact web.

$$M_n = F_y \times S_e \tag{F7-3}$$

where

S_e = the effective section modulus determined with the effective compression flange taken as b_e

b_e = $1.93 t_f \sqrt{\frac{E}{F_y}}\left[1 - \frac{0.38}{b / t_f}\sqrt{\frac{E}{F_y}}\right] = 1.93 \times 0.174\sqrt{\frac{29{,}000}{46}}\left[1 - \frac{0.38}{0.43}\sqrt{\frac{29{,}000}{46}}\right] = 6.53\ in$

The width of the compression flange between the corners (assumed to be $1.5t$) is:

$$b = 8 - 2 \times 1.5 \times t = 8 - 3(0.174) = 7.48 \text{ in} > 6.53 \text{ in}$$

Thus, the ineffective width of the compression flange is: $b - b_e = 7.48 - 6.53 = 0.95\ in$

Subtract this contribution of this ineffective flange area from the gross moment of inertia to approximate the effective moment of inertia:

$$I_{\text{eff}} \approx 54.4 - 2\left[\frac{0.95(0.174)^3}{12} + 0.95(0.174)(3.91)^3\right] = 49.3 \text{ in}^4$$

$$S_e = \frac{I_{\text{eff}}}{d/2} = \frac{49.3}{8.0/2} = 12.3 \text{ in}^3$$

$$M_n = \ = 46 \times 12.3 = 566 \text{ in-k} = 47.2 \text{ ft-k}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(47.2) = 42.5\ ft \cdot k$

ASD: $M_n / \Omega_b = {}^{47.2}/_{1.67} = 28.3\ ft \cdot k$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	42.5	42.5	none	
M_n/Ω_b (ft·k) [ASD]	28.3	28.3	none

V. AISC 360-05 HSST Torsional Strength H.5A

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example H.5a, pp.H-12,13

Details

From reference (2):

> Determine the available torsional strength of an ASTM A500 Gr. B HSS6×4×1/4.

Validation

$h/t > b/t$, so h/t governs.

$$\frac{h}{t} = 22.8 < 2.45\sqrt{\frac{E}{F_y}} = 2.45\sqrt{\frac{29,000}{46}} = 61.5$$

$$F_{cr} = 0.6F_y = 0.6(46) = 27.6 \text{ ksi} \qquad \text{(Eq. H3-3)}$$

Nominal Torsional Strength

$$T_n = F_{cr}C = 27.6(10.1) = 279 \text{ in}\cdot\text{k} \qquad \text{(Eq. G2-1)}$$

The available shear strength:

LRFD: $\phi_T T_n = 0.90(279) = 251\ in\cdot k$

ASD: $T_n / \Omega_T = {}^{279}\!/_{1.67} = 167\ in\cdot k$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_G T_n$ (in·k) [LRFD]	251	251	none	
G_n/Ω_T (in·k) [ASD]	167	167	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 HSST Torsional Strength H.STD` is typically installed with the program.

V. AISC 360-05 I Minor Axis Bending F.5

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F.5, pp.F-25,26

Details

From reference (2):

> Select an ASTM A992 W-shape beam loaded in its minor axis with a simple span of 15 ft. The nominal loads are a total uniform dead load of 0.667 kip/ft and a uniform live load of 2 kip/ft. Limit the live load deflection to L/240. Assume the beam is braced at the ends only.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	122	122	none	
M_n / Ω_b (ft·k) [ASD]	81.4	81.1	negligible

V. AISC 360-05 L Shear Capacity G.3

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example G.3, p.G-7

Details

From reference (2):

> Verify the shear strength of a 5×3×1/4 (LLV) ASTM A36 angle with end shears of 3.5 kips from dead load and 10.5 kips from live load.

Validation

Ultimate load:

$$V_u = 1.2(3.50 \text{ kips}) + 1.6(10.5 \text{ kips}) = 21.0 \text{ kips}$$

Service load:

$$V_a = 3.50 \text{ kips} + 10.5 \text{ kips} = 14.0 \text{ kips}$$

Area of the web for shear:

$$A_w = bt = 5.0(0.25) = 1.25 \text{ in}^2$$

Section G4 of Reference 1 gives $k_v = 1.2$.

$$\frac{h}{t_w} = \frac{b}{t} = \frac{5.0}{0.25} = 20 < 1.10\sqrt{\frac{k_v E}{F_y}} = 1.10\sqrt{\frac{1.2(29,\ 000)}{36}} = 34.2$$

Therefore, $C_v = 1.0$.

<u>Nominal Shear Strength</u>

$$V_n = 0.6F_y A_w C_v = 0.6(36)(1.25)(1.0) = 27.0 \text{ kips} \quad \text{(Eq. G2-1)}$$

The available shear strength:

LRFD: $\phi_v V_n = 0.90(27.0) = 24.3 \text{ kips}$

ASD: $V_n / \Omega_v = {}^{27.0}\!/_{1.67} = 16.2 \text{ kips}$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	24.3	24.3	none	
V_n/Ω_v (kips) [ASD]	16.2	16.2	none

V. AISC 360-05 Pipe F.9

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F.9, pp.F-35,36

Details

From reference (2):

Select an ASTM A53 grade B Pipe shape with a simple span of 16 ft. The nominal loads are a total uniform dead load of 0.32 kip/ft and a uniform live load of 0.96 kip/ft. Assume there is no deflection limit for this beam. The beam is braced only at the ends.

Validation

Ultimate moment:

$$w_u = 1.2(0.32 \text{ k/ft}) + 1.6(0.96 \text{ k/ft}) = 1.92 \text{ k/ft}$$

$$M_u = \frac{1.92(16)^2}{8} = 61.4 \text{ ft}\cdot\text{k}$$

Service moment:

$$w_a = 0.32 \text{ k/ft} + 0.96 \text{ k/ft} = 1.28 \text{ k/ft}$$

$$M_a = \frac{1.28(16)^2}{8} = 41.0 \text{ ft}\cdot\text{k}$$

Try a pipe 8 x-strong, which has a plastic section modulus, $Z_x = 31.0\ in^3$.

The yield strength, $F_y = 35\ ksi$

Compactness ratio: $\lambda = D/t = 18.5$

Determine the slender flange ratio limit from Table B4.1b: $\lambda_p = \frac{0.07E}{F_y} = \frac{0.07(29{,}000)}{35} = 58.0 > \lambda$ (Compact)

By observation, $\lambda < \frac{0.45E}{F_y}$, so Section F8 applies.

$$\lambda_p = 2.42\sqrt{\frac{E}{F_y}} = 2.42\sqrt{\frac{29{,}000}{46}} = 60.8 > \lambda$$

$$M_n = M_p = F_y \times Z_x = 35 \times 31.0 = 1{,}090 \text{ in-k} = 90.4 \text{ ft-k} \quad \text{(F8-1)}$$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(90.4) = 81.4\ ft\cdot k$

ASD: $M_n / \Omega_b = {}^{90.4}/_{1.67} = 54.1\ ft\cdot k$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	81.4	81.4	none	
M_n / Ω_b (ft·k) [ASD]	54.1	54.1	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 Pipe F.STD` is typically installed with the program.

V. AISC 360-05 Rect HSS E.9

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example E.9, pp.E-37,38

Details

From reference (2):

> Select a rectangular HSS compression member, with a length of 20 ft, to support a dead load of 85 kips and live load of 255 kips in axial compression. The base is fixed and the top is pinned.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	518	518	none	
P_n/Ω_c (kips) [ASD]	344	345	negligible

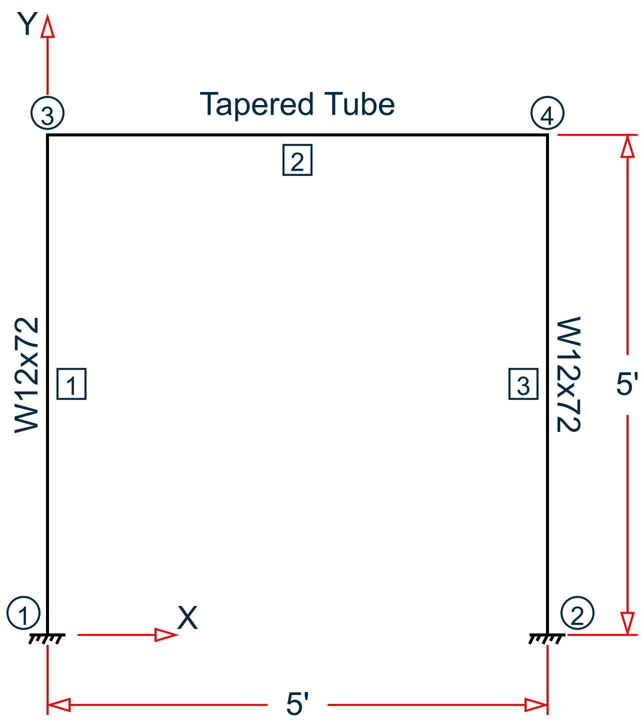
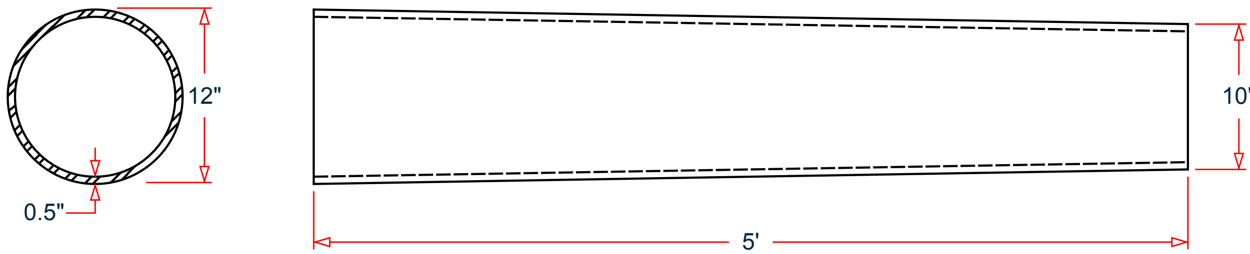
V. AISC 360-05 Tapered Tube Section

Verify the axial compression capacity, flexure capacity, and interaction ratio of a tapered tube section member per both the LRFD and ASD methods of the AISC 360-05 code.

Details

A 5' × 5' portal frame consists of W12x72 columns and a steel tapered member for the beam.





Section Elevation

The following load cases are evaluated:

1. A uniformly distributed load of -2.25 k/in along the beam in the global Y direction.
2. Lateral loads at the top of the left column of 50 kips in the global X direction and 25 kips in the global Z direction (out of plane).
3. A concreted torque of 0.75 in·kips at mid-span of the beam.

Material Properties

E = 29,000 ksi
Fy = 50 ksi

Validation

Design Forces

By inspection, the right end of the beam (shallowest overall depth) governs under the symmetric loads present. The following design loads are used from the STAAD.Pro analysis are then used:

$M_z = 505.66\ in \cdot kips$
$F_y = 67.2\ kips$
$F_x = 10.23\ kips$

Section Properties

The section at the right end ($OD = 10\ in.$) has the following properties:

Inner diameter, ID = 9 in.
Area, $A_g = (\pi / 4)(OD^2 - ID^2) = 14.92\ in^2$
Form factor = $0.49 + 0.8\ (t\ /\ OD) = 0.53$
Shear area, $A_y = 14.92(0.53) = 7.909\ in^2$
Moment of inertia,

$$I = \frac{\pi}{64}\left(\mathrm{OD}^4\text{-}\mathrm{ID}^4\right) = 168.8\ \mathrm{in}^4$$

Elastic section modulus, $S = \frac{\pi}{32}\left(\frac{OD^{\,4}\text{-}ID^{\,4}}{OD}\right) = 33.76\ in^3$

Radius of gyration, $r = \sqrt{\frac{I}{A_g}} = \sqrt{\frac{168.8}{14.92}} = 3.363\ in$

Plastic section modulus, $Z = \frac{OD^{\,3}\text{-}ID^{\,3}}{6} = 45.17\ in^3$

HSS Torsional constant, $C = \frac{\pi}{2}(OD\text{-}t)^2 t = 70.88\ in^3$

Section Classification

Flange in compression

$$\lambda = \frac{\text{OD}}{t} = \frac{10}{0.5} = 20$$

Per Table B4.1-15a, $\lambda < \lambda_r = 0.11\frac{E}{F_y} = 63.8$, therefore flanges are non-slender for compression. The web is similarly non-slender for compression.

Flange in bending (use half the longer flange width as the outstanding width):

$$\lambda = \frac{\text{OD}}{t} = \frac{10}{0.5} = 20$$

Per Table B4.1-15b, $\lambda < \lambda_r = 0.07\frac{E}{F_y} = 40.6$, therefore flange is compact for bending.

Compression Capacity

$$\frac{kL}{r} = \frac{1.0(60)}{3.363} = 17.84 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,\ 000}{50}} = 113.4$$

$$F_e = \frac{\pi^2 E}{\left(\frac{kL}{r}\right)^2} = \frac{\pi^2 \times 29{,}000}{(17.84)^2} = 899.4 \text{ ksi} \qquad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_e} = \frac{50}{899.4} = 0.056 < 2.25$$

$$F_{\text{crx}} = 0.658^{F_y/F_e} F_y = 0.658^{(0.056)} 50 = 48.85 \text{ ksi} \qquad \text{(Eq. E3-2)}$$

$$\text{P}_\text{n} = \text{A}_\text{g} \times \text{F}_\text{cr} = 14.92 \times 48.85 = 729.0 \text{ kips} \qquad \text{(Eq. E3-1)}$$

The axial capacity:

The ultimate compression capacity (LRFD) = $\phi_c P_n = 0.9 \times 729.0 = 656.1\ kips$
The allowable compression capacity (ASD) = $P_n/\Omega_c = 729.0\ /\ 1.67 = 436.5\ kips$

Shear Capacity

The distance from the maximum shear force (ends) to zero shear force (mid-span), $L_v = L\ /\ 2 = 30\ in.$

The critical shear stress, F_{cr}, *is the minimum of*:

$$F_{\text{cr1}} = \frac{1.60E}{\sqrt{\frac{L_v}{\text{OD}}}\left(\frac{\text{OD}}{t}\right)^{5/4}} = 633.4 \text{ ksi}$$

$$F_{\text{cr2}} = \frac{0.78E}{\left(\frac{\text{OD}}{t}\right)^{3/2}} = 252.9 \text{ ksi}$$

$$F_{\text{cr3}} = 0.6F_y = 30 \text{ ksi}$$

$F_{cr} = 30\ ksi$

Nominal shear capacity:

$$V_n = F_{cr} {}^{A_g}\!/_2 = 223.8 \text{ kips}$$

The shear capacity:

The ultimate shear capacity (LRFD) = $\phi_c V_n = 0.9 \times 223.8 = 201.5 \ kips$
The allowable shear capacity (ASD) = $V_n/\Omega_c = 223.8 \ / \ 1.67 = 134.0 \ kips$

<u>Calculate Bending Capacity</u>

Bending capacity in plastic yielding:

$$\mathrm{M_p = F_y \times Z = 50 \times 45.17 = 2{,}259 \ in{\cdot}kips < 1.6F_y \times S = 1.6\ (50)\ (33.76) = 2{,}701\ in{\cdot}kips}$$

The bending capacity for flexural yielding:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 2{,}259 = 2{,}033 \ in{\cdot}kips$
The allowable bending capacity (ASD) = $M_y/\Omega_b = 2{,}259 \ / \ 1.67 = 1{,}352 \ in{\cdot}kips$

<u>Torsional Capacity</u>

The critical stress, F_{cr}, *is the larger of*:

$$F_{cr1} = \frac{1.23E}{\sqrt{\frac{L}{\mathrm{OD}}}\left(\frac{\mathrm{OD}}{t}\right)^{5/4}} = 344.3 \text{ ksi}$$

$$F_{cr2} = \frac{1.23E}{\left(\frac{\mathrm{OD}}{t}\right)^{3/2}} = 194.5 \text{ ksi}$$

But shall not exceed:

$$F_{cr3} = 0.6F_y = 30 \text{ ksi}$$

$F_{cr} = 30 \ ksi$

Nominal torsional capacity:

$$T_n = F_{cr}C = 2{,}126 \text{ in}{\cdot}\text{kips}$$

The torsional capacity:

The ultimate torsional capacity (LRFD) = $\phi_c T_n = 0.9 \times 2{,}126 = 1{,}914 \ kips$
The allowable torsional capacity (ASD) = $T_n/\Omega_c = 2{,}126 \ / \ 1.67 = 1{,}273 \ kips$

<u>Interaction Ratio for Bending and Compression</u>

Check the interaction ratio for Load Case 1:

$$\frac{P_r}{P_c} = \frac{10.23}{656.1} = 0.016 < 0.2 \text{ (LRFD)}$$

$$\frac{P_r}{P_c} = \frac{10.23}{436.5} = 0.023 < 0.2 \text{ (ASD)}$$

So use Eq. H1-1b for both methods: $\frac{P_r}{2P_c} + \left(\frac{M_{rx}}{M_{cx}} + \frac{M_{ry}}{M_{cy}}\right) \leq 1.0.$

$$\frac{0.016}{2} + \left(\frac{505.7}{2{,}033} + \frac{0}{2{,}033}\right) = 0.257 \text{ (LRFD)}$$

$$\frac{0.023}{2} + \left(\frac{505.7}{1{,}352} + \frac{0}{1{,}352}\right) = 0.386 \text{ (ASD)}$$

Results

Table 767:

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Compression capacity (kips)	656.1	656	negligible	
	Shear capacity (kips)	201.5	201	negligible	
	Bending capacity (in·kips)	2,033	2,030	negligible	
	Torsional capacity (in·kips)	1,914	1,910	negligible	
	Interaction ratio	0.257	0.257	none	
ASD	Compression capacity (kips)	436.5	437	negligible	
	Shear capacity (kips)	134.0	134	negligible	
	Bending capacity (in·kips)	1,352	1,350	negligible	
	Torsional capacity (in·kips)	1,273	1,270	negligible	
	Interaction ratio	0.386	0.386	none	

The following D1.A.6 Design Parameters (on page 1100) are used:

- The welded tapered member is specified using `STP 2`

The remaining parameters all use their default values.

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-10 Tapered Tube Section.STD` is typically installed with the program.

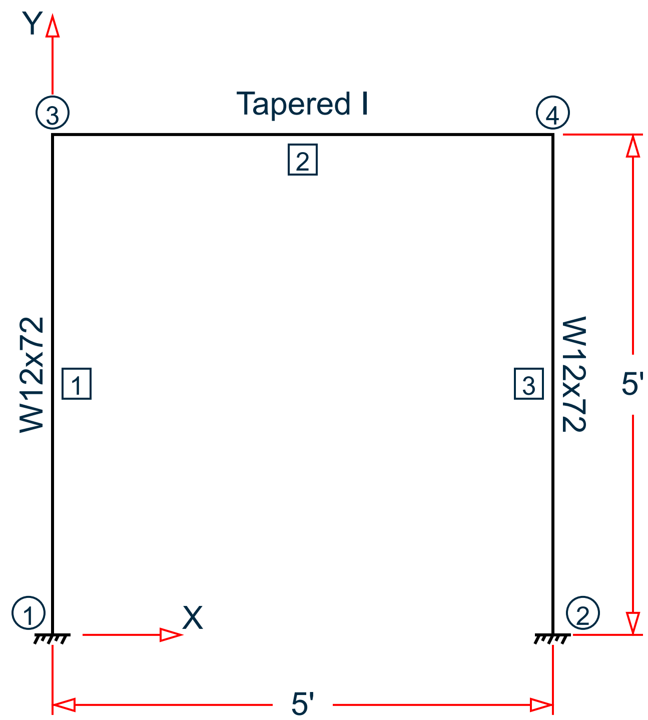
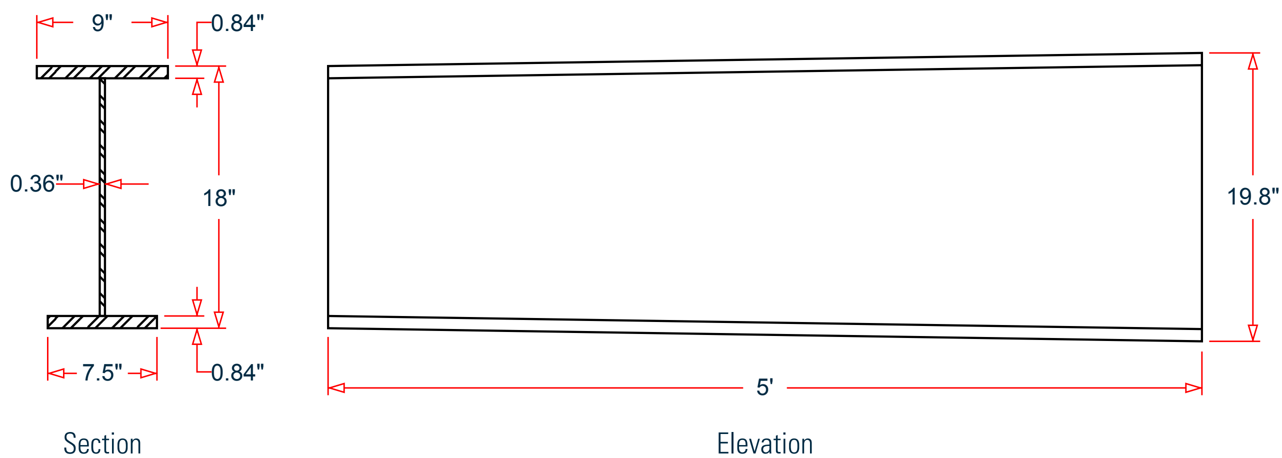
V. AISC 360-05 Tapered I Section

Verify the axial compression capacity, flexure capacity, and interaction ratio of a tapered I section member per both the LRFD and ASD methods of the AISC 360-05 code.

Details

A 5' × 5' portal frame consists of W12x72 columns and a steel tapered member for the beam.





The following load cases are evaluated:

1. A uniformly distributed load of -3.5 k/ft along the beam in the global Y direction.
2. Lateral loads at the top of the left column of 50 kips in the global X direction and 25 kips in the global Z direction (out of plane).
3. Lateral loads at the top of the right column of -50 kips in the global X direction and 45 kips in the global Z direction (out of plane).
4. A concreted load of -100 kips in the global Y direction and a concentrated torque of 9 in·kips at mid-span of the beam.

Material Properties

E = 29,000 ksi
Fy = 50 ksi

Validation

Design Forces

By inspection, the left end of the beam (shallowest overall depth) governs under the symmetric loads present. The following design loads are used from the STAAD.Pro analysis are then used:

1. M_z = 32.26 in·kips, F_y = 8.755 kips
2. M_z = 677.6 in·kips, M_y = 2.942 in·kips, M_x = 5.106 in·kips, F_y = 22.49 kips, F_z = 0.098 kips, F_x = 24.70 kips
3. M_z = 275.9 in·kips, M_x = 4.497 in·kips, F_y = 50.23 kips, F_x = 5.473 kips
4. M_z = 654.5 in·kips, M_y = 5.298 in·kips, M_x = 9.192 in·kips, F_y = 22.50 kips, F_z = 0.177 kips, F_x = 24.35 kips

Section Properties

The section at the left end ($D = 18\ in.$) has the following properties:

Web height, $d_w = 18 - 2 \times 0.84 = 16.32\ in.$
Area, $A_g = (0.84)(9 + 7.5) + 16.32\ (0.36) = 19.74\ in^2$
Shear area in local y, $A_y = 16.32(0.36) = 5.875\ in^2$
Shear area in local x, $A_x = 0.84(9 + 7.5) = 13.86\ in^2$

Dist to centroid y, $c = \dfrac{7.5(0.84)\left(\frac{0.84}{2}\right) + 0.36(16.32)\left(0.84 + \frac{16.32}{2}\right) + 9(0.84)\left(18 - \frac{0.84}{2}\right)}{19.74} = 9.548\ in.$

Moment of inertia about major axis,

$$I_{zz} = \begin{aligned} &\frac{7.5(0.84)^3}{12} + 7.5(0.84)\left(9.548 - \frac{0.84}{2}\right)^2 \\ &+ \frac{0.36(16.32)^3}{12} + 0.36(16.32)\left(9.548 - \frac{16.32}{2} - 0.84\right)^2 \\ &+ \frac{9(0.84)^3}{12} + 9(0.84)\left(18 - \frac{0.84}{2} - 9.548\right)^2 \end{aligned} = 1,147\ \text{in}^4$$

Moment of inertia about minor axis,

$$I_{yy} = \frac{0.84(9)^3}{12} + \frac{16.32(0.36)^3}{12} + \frac{0.84(7.5)^3}{12} = 80.62\ \text{in}^4$$

Elastic section modulus about major axis top flange fiber, $S_{xx,top} = \dfrac{I_{zz}}{D - c} = \dfrac{1,146}{18 - 9.548} = 135.5\ in^3$

Elastic section modulus about major axis bottom flange fiber, $S_{xx,bottom} = \dfrac{I_{zz}}{c} = \dfrac{1,146}{9.548} = 120.0\ in^3$

Elastic section modulus about minor axis, $S_{yy} = \dfrac{I_{yy}}{b_{f1}/2} = \dfrac{80.62}{9/2} = 17.92\ in^3$

Radius of gyration about major axis, $r_x = \sqrt{\dfrac{I_{zz}}{A_g}} = \sqrt{\dfrac{1,147}{19.74}} = 7.619\ in$

Radius of gyration about minor axis, $r_y = \sqrt{\dfrac{I_{yy}}{A_g}} = \sqrt{\dfrac{80.62}{19.74}} = 2.021\ in$

Location of the plastic neutral axis, $y_{PNA} = 0.84 + \frac{19.74 - 2(7.5)(0.84)}{2 \times 0.36} = 10.75\ in.$

Plastic section modulus about major axis,

$$Z_{zt} = \frac{7.5(10.75)^2}{2} - \frac{(7.5 - 0.36)(10.75 - 0.84)^2}{2} + \frac{9(18 - 10.75)^2}{2} - \frac{(9 - 0.36)(18 - 0.84 - 10.75)^2}{2} = 141.8\ \text{in}^3$$

Plastic section modulus about minor axis, $Z_y = \frac{0.84(9)^2}{4} + \frac{16.32(0.36)^2}{4} + \frac{0.84(7.5)^2}{4} = 29.35\ in^3$

Torsional constant, $J = \frac{9(0.84)^3 + 16.32(0.36)^3 + 7.5(0.84)^3}{3} = 3.514\ in.^4$

Section Classification

Flange in compression

$$\lambda = \frac{b}{t} = \frac{1/2 \times 7.5}{0.84} = 4.464$$

$$k_c = \frac{4}{\sqrt{d_w / t_w}} = \frac{4}{\sqrt{\frac{16.32}{0.36}}} = 0.594$$

Per Table B4.1a, $\lambda < \lambda_r = 0.64\sqrt{\frac{k_c E}{F_y}} = 0.64\sqrt{\frac{0.594(29,000)}{50}} = 11.88$, therefore flanges are non-slender for compression.

Web in compression

$$\lambda = \frac{d_w}{t_w} = \frac{16.32}{0.36} = 45.33$$

Per Table B4.1a, Case 5, $\lambda > \lambda_r = 1.49\sqrt{\frac{E}{F_y}} = 1.49\sqrt{\frac{29,000}{50}} = 35.88$, therefore the web is slender for compression.

Flange in bending (use half the longer flange width as the outstanding width):

$$\lambda = \frac{b_f}{t_f} = \frac{9}{2(0.84)} = 5.36$$

Per Table B4.1b, Case 11, $\lambda < \lambda_p = 0.38\sqrt{\frac{E}{F_y}} = 0.38\sqrt{\frac{29,000}{50}} = 9.15$, therefore flange is compact for bending.

Web in bending

$$\lambda = \frac{d_w}{t_w} = \frac{16.32}{0.36} = 45.33$$

Per Table B4.1b, Case 15, $\lambda < \lambda_p = 3.76\sqrt{\frac{E}{F_y}} = 3.76\sqrt{\frac{29,000}{50}} = 90.55$, therefore web is compact for bending.

Compression Capacity

About X Axis:

$$\frac{k_x L_x}{r_x} = \frac{1.0(60)}{7.619} = 7.875 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,000}{50}} = 113.4$$

$$F_{ex} = \frac{\pi^2 E}{\left(\frac{k_x L_x}{r_x}\right)^2} = \frac{\pi^2 \times 29,000}{(7.875)^2} = 4{,}615 \text{ ksi} \quad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_{ex}} = \frac{50}{4{,}615} = 0.011 < 2.25$$

$$F_{crx} = 0.658^{F_y/F_{ex}} F_y = 0.658^{(0.011)} 50 = 49.77 \text{ ksi} \quad \text{(Eq. E3-2)}$$

Since the web is slender, use the effective area. The effective width imperfection adjustment factors (Table E7.1):

$c_1 = 0.18$

$c_2 = 1.31$

$$F_{el} = \left(c_2 \frac{\lambda_r}{\lambda}\right)^2 F_y = \left(1.31 \frac{35.88}{45.33}\right)^2 = 53.76 \text{ ksi} \quad \text{(Eq. E7-5)}$$

Therefore, the effective depth of the web in compression for the effective area:

$$d_e = d_w\left(1 - c_1\sqrt{\frac{F_{el}}{F_{crx}}}\right)\sqrt{\frac{F_{el}}{F_{crx}}} = 16.32\left(1 - 0.18\sqrt{\frac{53.76}{49.77}}\right)\sqrt{\frac{53.76}{49.77}} = 13.78 \text{ in.} \quad \text{(Eq. E7-3)}$$

The reduced area of the section then becomes:

$$A_e = 19.75 - (16.32 - 13.78)0.36 = 18.84 \text{ in.}^2$$

$$P_{nx} = A_e \times F_{crx} = 18.84 \times 49.77 = 937.4 \text{ kips} \quad \text{(Eq. E7-1)}$$

About Y Axis:

$$\frac{k_y L_y}{r_y} = \frac{1.0(60)}{2.021} = 29.69 < 4.71\sqrt{\frac{E}{F_y}} = 113.4$$

$$F_{ey} = \frac{\pi^2 E}{\left(\frac{k_y L_y}{r_y}\right)^2} = \frac{\pi^2 \times 29,000}{(29.69)^2} = 324.7 \text{ ksi} \quad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_{ey}} = \frac{50}{324.7} = 0.154 < 2.25$$

$$F_{cry} = 0.658^{(F_y/F_{ey})} F_y = 0.658^{(0.154)} 50 = 46.88 \text{ ksi} \quad \text{(Eq. E3-2)}$$

Therefore, the effective depth of the web in compression for the effective area:

$$d_e = d_w\left(1 - c_1\sqrt{\frac{F_{el}}{F_{cry}}}\right)\sqrt{\frac{F_{el}}{F_{cry}}} = 16.32\left(1 - 0.18\sqrt{\frac{53.76}{46.88}}\right)\sqrt{\frac{53.76}{46.88}} = 14.11 \text{ in.} \quad \text{(Eq. E7-3)}$$

The reduced area of the section then becomes:

$$A_e = 19.75 - (16.32 - 14.11)0.36 = 18.93 \text{ in.}^2$$

$P_{ny} = A_e \times F_{cry} = 18.93 \times 46.88 = 887.4$ kips (Eq. E7-1)

The Y axis governs; $P_n = P_{ny}$. The axial capacity:

The ultimate compression capacity (LRFD) = $\phi_c P_n = 0.9 \times 887.4 = 798.3\ kips$
The allowable compression capacity (ASD) = $P_n / \Omega_c = 887.4\ /\ 1.67 = 531.4\ kips$

<u>Calculate Bending Capacity</u>

Bending capacity in plastic yielding about Y axis:

$$M_y = F_y \times Z_y = 50 \times 29.35 = 1{,}468 \text{ in·kips} > 1.6F_y \times S_y = 1.6\ (50)\ (17.92) = 1{,}434 \text{ in·kips}$$

Use $M_y = 1{,}434\ in \cdot kips$

The bending capacity for flexural yielding about the Y axis:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 1{,}434 = 1{,}290\ in \cdot kips$
The allowable bending capacity (ASD) = $M_y / \Omega_b = 1{,}434\ /\ 1.67 = 858.4\ in \cdot kips$

Bending capacity in plastic yielding about X axis:

The section is capacity is determined as per F4 in the specification. The design moments for this are from Load Case 4 and occur at mid-span (d = 18.9 in.). The section properties at this location are:

$I_{zz} = 1{,}278\ in^4$
$I_{yy} = 80.63\ in^4$
$c = 10.01\ in$
$h_c = 2 \times (10.01 - 0.84) = 18.35\ in.$
$S_x = 143.8\ in^3$
$Z_x = 150.7\ in^3$

$$M_{yc} = F_y \times S_{yc} = 50 \times 143.8 = 7{,}192 \text{ ksi}$$

$$M_p = F_y \times Z_x = 50 \times 150.7 = 7{,}535 \text{ ksi} \leq 1.6\ F_y \times S_x = 11{,}504 \text{ ksi}$$

The moment of inertia of the compression flange about the Y axis $I_{yc} = \frac{0.84(7.5)^3}{12} = 29.53\ in.^4$, and thus $I_{yc} / I_y = {}^{29.53}\!/_{80.63} = 0.366 > 0.23$. $\frac{h_c}{t_w} = \frac{18.35}{0.36} = 50.99 < \lambda_{pw} = 90.55$ (limiting slenderness for a compact web per Table B4.1b case 15), so the web plastification factor, R_{pc} is determined as:

$$R_{pc} = \frac{M_p}{M_{yc}} = \frac{7{,}535}{7{,}192} = 1.048 \qquad \text{(F4-9a)}$$

Bending capacity in plastic yielding about Y axis:

$$M_n = R_{pc} \times M_{yc} = 1.048 \times 7{,}192 = 7{,}535 \text{ in·kips}$$

The bending capacity for flexural yielding about the Y axis:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 7{,}535 = 6{,}782\ in \cdot kips$
The allowable bending capacity (ASD) = $M_y / \Omega_b = 7{,}535\ /\ 1.67 = 4{,}512\ in \cdot kips$

<u>Interaction Ratio for Bending and Compression</u>

Check the interaction ratio for Load Case 3:

$$\frac{P_r}{P_c} = \frac{5.473}{798.3} = 0.007 < 0.2 \text{ (LRFD)}$$

$$\frac{P_r}{P_c} = \frac{5.479}{531.4} = 0.010 < 0.2 \text{ (ASD)}$$

So use Eq. H1-1b for both methods: $\frac{P_r}{2P_c} + \left(\frac{M_{rx}}{M_{cx}} + \frac{M_{ry}}{M_{cy}}\right) \leq 1.0.$

$$\frac{0.007}{2} + \left(\frac{1{,}225}{6{,}783} + \frac{0}{1{,}290}\right) = 0.184 \text{ (LRFD)}$$

$$\frac{0.010}{2} + \left(\frac{1{,}225}{4{,}513} + \frac{0}{858}\right) = 0.277 \text{ (ASD)}$$

Results

Table 768:

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Compression capacity (kips)	798.3	799	negligible	
	Major axis bending capacity (in·kips)	6,782	6,780	negligible	
	Minor axis bending capacity (in·kips)	1,290	1,290	none	
	Interaction ratio	0.184	0.184	none	
ASD	Compression capacity (kips)	531.4	532	negligible	
	Major axis bending capacity (in·kips)	4,512	4,510	negligible	
	Minor axis bending capacity (in·kips)	858.4	858	negligible	
	Interaction ratio	0.277	0.277	none	

The following D1.A.6 Design Parameters (on page 1100) are used:

- The welded tapered member is specified using `STP 2`

The remaining parameters all use their default values.

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 Tapered I Section.STD` is typically installed with the program.

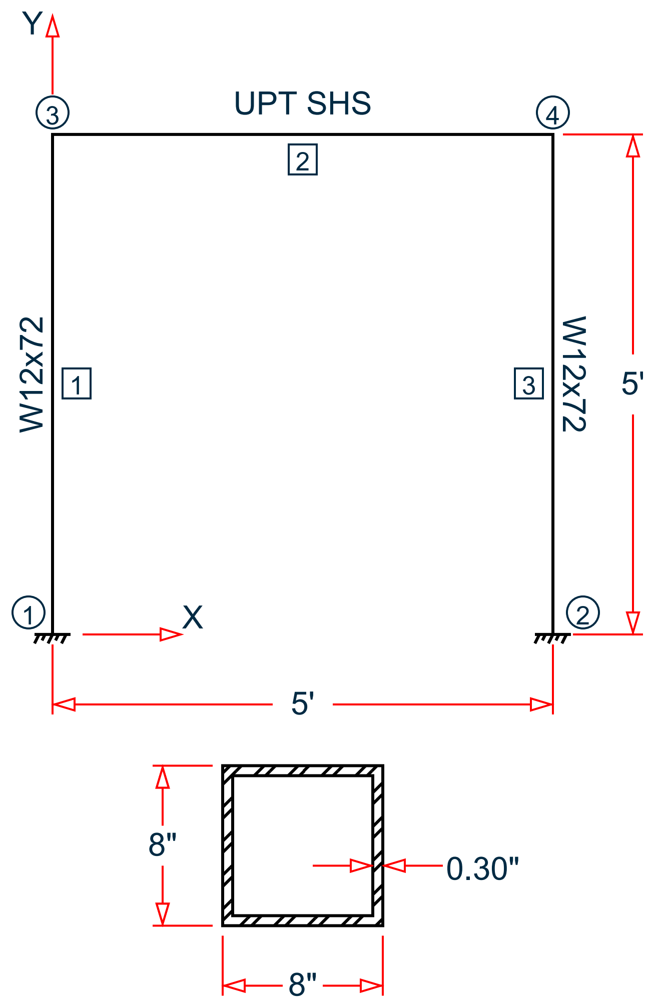
V. AISC 360-05 UPT Square Hollow Section

Verify the axial compression capacity, shear capacity, flexure capacity, torsional capacity, and interaction ratio of a user-provided hollow square section member per both the LRFD and ASD methods of the AISC 360-05 code.

Details

A 5' × 5' portal frame consists of W12x72 columns and a UPT SHS member for the beam. The section outer depth, D, is 8" and the thickness, t, is 0.30".



Section

The following load cases are evaluated:

1. A uniformly distributed load of -2.25 k/in along the beam in the global Y direction.
2. Lateral loads at the top of the left column of 50 kips in the global X direction and 25 kips in the global Z direction (out of plane).
3. A concentrated torque of 0.75 in·kips at mid-span of the beam.

Material Properties

E = 29,000 ksi
Fy = 50 ksi

Validation

<u>Design Forces</u>

The following design loads are used from the STAAD.Pro analysis are then used:

1. M_z = 599.6 in·kips, F_y = 67.5 kips

Section Properties

Inner depth, $d = 8 - 2\times 0.30 = 7.40\ in.$

Area, $A_g = D^2 - d^2 = 9.24\ in^2$

Shear area, $A_w = 2\times D\times t_w = 4.80\ in^2$

Moment of inertia, $I = \frac{1}{12}\left(D^4 - d^4\right) = 91.45\ in^4$

Elastic section modulus, $S = \frac{I}{D/2} = \frac{91.45}{8/2} = 22.86\ in^3$

Radius of gyration, $r = \sqrt{\frac{I}{A_g}} = \sqrt{\frac{91.45}{9.24}} = 3.146\ in$

Plastic section modulus, $Z = \frac{1}{6}\left(D^3 - d^3\right) = 26.69\ in^3$

HSS Torsional constant, $C = 2\left(B - t_w\right)\left(D - t_w\right)t_w - 4.5\left(4 - \pi\right)t_w{}^3 = 35.47\ in^3$

Section Classification

The design thickness, $t = 0.93\times t_w = 0.279\ in$

The design depth, $d = D - 3t = 7.163\ in$

Flange in compression

$$\lambda = \frac{d}{t} = \frac{7.163}{0.279} = 25.67$$

Per Table 4.1a Case 6, $\lambda < \lambda_r = 1.40\sqrt{\frac{E}{F_y}} = 1.40\sqrt{\frac{29{,}000}{50}} = 33.72$, therefore flanges are non-slender for compression. Similar for the web of the square section.

Flexure classification of flange:

Per Table B4.1-12, $\lambda < \lambda_p = 1.12\sqrt{\frac{E}{F_y}} = 1.12\sqrt{\frac{29{,}000}{50}} = 26.97$, therefore flange is compact for bending.

Flexure classification of web:

Per Table B4.1-13, $\lambda < \lambda_p = 2.42\sqrt{\frac{E}{F_y}} = 2.42\sqrt{\frac{29{,}000}{50}} = 58.28$, therefore web is compact for bending.

Compression Capacity

Effective slenderness ratio:

$$\frac{k_x L_x}{r_x} = \frac{1.0(60)}{3.146} = 19.07 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,\ 000}{50}} = 113.4$$

Elastic buckling stress:

$$F_e = \frac{\pi^2 E}{\left(\frac{k_x L_x}{r_x}\right)^2} = \frac{\pi^2 \times 29,\ 000}{(19.07)^2} = 787\ \text{ksi} \qquad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_e} = \frac{50}{787} = 0.064 < 2.25$$

Critical buckling stress:

$$F_{cr} = 0.658^{F_y / F_e} F_y = 0.658^{(0.064)} 50 = 48.68 \text{ ksi} \quad \text{(Eq. E3-2)}$$

Nominal buckling strength:

$$P_n = A_g \times F_{cr} = 9.24 \times 48.68 = 449.9 \text{ kips} \quad \text{(Eq. E3-1)}$$

The axial capacity:

The ultimate compression capacity (LRFD) = $\phi_c P_n = 0.9 \times 449.9 = 404.9 \ kips$
The allowable compression capacity (ASD) = $P_n / \Omega_c = 449.9 \ / \ 1.67 = 269.4 \ kips$

Calculate Shear Capacity The nominal shear strength:

$$V_n = 0.6 \times F_y \times A_w \times C_{v2} \quad \text{(Eq. G4-1)}$$

where

C_{v2} = 1.0 per Section G2.2 with $h/t = 25.67$ and $K_v = 5$.

$$V_n = 0.6\ (50)\ (4.80)\ (1.0) = 144 \text{ kips}$$

The shear capacity:

The ultimate shear capacity (LRFD) = $\phi_v V_n = 0.9 \times 144 = 129.6 \ kips$
The allowable shear capacity (ASD) = $V_n / \Omega_v = 144 \ / \ 1.67 = 86.23 \ kips$

Calculate Bending Capacity

Bending capacity in plastic yielding (compact section):

$$M_p = F_y \times Z_x = 50 \times 26.69 = 1{,}335 \text{ in} \cdot \text{kips} \quad \text{(Eq F7-1)}$$

The bending capacity for flexural yielding about the Y axis:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 1{,}335 = 1{,}201 \ in \cdot kips$
The allowable bending capacity (ASD) = $M_y / \Omega_b = 1{,}335 \ / \ 1.67 = 799.2 \ in \cdot kips$

Torsional Capacity

$$\frac{h}{t} = 25.67 < 2.45\sqrt{\frac{E}{F_y}} = 59.0$$

$$F_{cr} = 0.6 F_y = 30 \text{ ksi}$$

Nominal torsional capacity:

$$T_n = F_{cr} \times C = 1{,}064 \text{ ksi}$$

The torsional capacity:

The ultimate torsional capacity (LRFD) = $\phi_T T_n = 0.9 \times 1{,}064 = 957.7 \ kips$
The allowable torsional capacity (ASD) = $T_n / \Omega_T = 1{,}064 \ / \ 1.67 = 637.2 \ kips$

Interaction Ratio for Bending and Compression

Check the interaction ratio for Load Case 1:

$$\frac{P_r}{P_c} = \frac{11.80}{404.9} = 0.029 < 0.2 \text{ (LRFD)}$$

$$\frac{P_r}{P_c} = \frac{11.80}{269.4} = 0.044 < 0.2 \text{ (ASD)}$$

So use Eq. H1-1b for both methods: $\frac{P_r}{2P_c} + \left(\frac{M_{rx}}{M_{cx}} + \frac{M_{ry}}{M_{cy}}\right) \le 1.0.$

$$\frac{0.029}{2} + \left(\frac{599.7}{1{,}201} + \frac{0}{1{,}201}\right) = 0.514 \text{ (LRFD)}$$

$$\frac{0.044}{2} + \left(\frac{599.7}{799.2} + \frac{0}{799.2}\right) = 0.765 \text{ (ASD)}$$

Results

Table 769:

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Compression capacity (kips)	404.9	405	negligible	
	Bending capacity (in·kips)	1,201	1,200	negligible	
	Shear capacity (kips)	129.6	130	negligible	
	Torsional capacity (in·kips)	957.7	958	negligible	
	Interaction ratio	0.514	0.514	negligible	
ASD	Compression capacity (kips)	269.4	269	negligible	
	Bending capacity (in·kips)	799.2	799	negligible	
	Shear capacity (kips)	86.23	86.2	negligible	
	Torsional capacity (in·kips)	637.2	637	negligible	
	Interaction ratio	0.765	0.772	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 UPT Square Hollow Section.STD` is typically installed with the program.

The following D1.A.6 Design Parameters (on page 1100) are used:

- The welded SHS member is specified using `STP 2`
- Shear lag factor, U for tension rupture capacity is specified by `SLF 0.8`

The remaining parameters all use their default values.

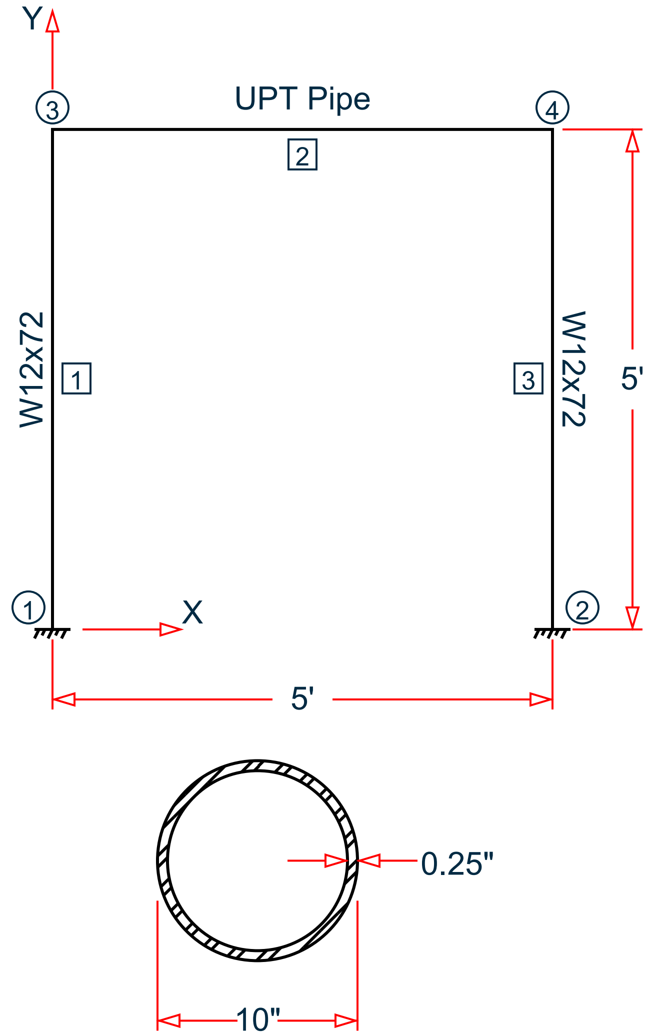
V. AISC 360-05 UPT Pipe Section

Verify the axial compression capacity, flexure capacity, and interaction ratio of a tapered I section member per both the LRFD and ASD methods of the AISC 360-05 code.

Details

A 5' × 5' portal frame consists of W12x72 columns and a UPT pipe member for the beam. The pipe outer diameter, D, is 10" and the thickness, t, is 0.25".



Section

The following load cases are evaluated:

1. A uniformly distributed load of -2.25 k/in along the beam in the global Y direction.
2. Lateral loads at the top of the left column of 50 kips in the global X direction and 25 kips in the global Z direction (out of plane).
3. A concentrated torque of 0.75 in·kips at mid-span of the beam.

Material Properties

E = 29,000 ksi
Fy = 50 ksi

Validation

Design Forces

The following design loads are used from the STAAD.Pro analysis are then used:

1. M_z = 599.6 in·kips, F_y = 67.5 kips

Section Properties

Inner diameter, $d = 10 - 2 \times 0.25 = 9.5\ in.$

Area, $A_g = \frac{\pi}{4}\left(D^2 - d^2\right) = 7.66\ in^2$

Shear area, $A_y = A_x = A_g\ /\ 2 = 3.83\ in^2$

Moment of inertia, $I_x = I_y = \frac{\pi}{64}\left(D^4 - d^4\right) = 91.05\ in^4$

Elastic section modulus, $S_{xx} = \frac{I_{xx}}{D\ /\ 2} = \frac{91.05}{10\ /\ 2} = 18.21\ in^3$

Radius of gyration, $r_x = \sqrt{\frac{I_{xx}}{A_g}} = \sqrt{\frac{91.05}{7.66}} = 3.448\ in$

Plastic section modulus, $Z_x = \frac{1}{6}\left(D^3 - d^3\right) = 23.77\ in^3$

HSS Torsional constant, $C = \frac{\pi}{2}(D - t)^2 t = 37.33\ in^3$

Section Classification

Flange in compression

$$\lambda = \frac{D}{t} = \frac{10}{0.25} = 40$$

Per Table 4.1a Case 9, $\lambda < \lambda_r = 0.11\frac{E}{F_y} = 0.11\frac{29{,}000}{50} = 63.8$, therefore flanges are non-slender for compression.

Web in compression

Per Table 4.1a, Case 9, $\lambda < \lambda_r = 0.11\frac{E}{F_y} = 0.11\frac{29{,}000}{50} = 63.8$, therefore the web is non-slender for compression.

Flexure classification:

Per Table 4.1b, Case 20, $\lambda < \lambda_p = 0.07\frac{E}{F_y} = 0.11\frac{29{,}000}{50} = 40.6$, therefore flange is compact for bending.

Compression Capacity

Effective slenderness ratio:

$$\frac{k_x L_x}{r_x} = \frac{1.0(60)}{3.448} = 17.40 < 4.71\sqrt{\frac{E}{F_y}} = 4.71\sqrt{\frac{29,\ 000}{50}} = 113.4$$

Elastic buckling stress:

$$F_e = \frac{\pi^2 E}{\left(\frac{k_x L_x}{r_x}\right)^2} = \frac{\pi^2 \times 29,\ 000}{(17.40)^2} = 945\ \text{ksi} \qquad \text{(Eq. E3-4)}$$

$$\frac{F_y}{F_e} = \frac{50}{945} = 0.053 < 2.25$$

Critical buckling stress:

$$F_{cr} = 0.658^{F_y/F_e} F_y = 0.658^{(0.053)} 50 = 48.91 \text{ ksi} \quad \text{(Eq. E3-2)}$$

Nominal buckling strength:

$$P_n = A_g \times F_{cr} = 7.66 \times 48.91 = 374.5 \text{ kips} \quad \text{(Eq. E3-1)}$$

The axial capacity:

The ultimate compression capacity (LRFD) = $\phi_c P_n = 0.9 \times 374.5 = 337.0 \textit{ kips}$
The allowable compression capacity (ASD) = $P_n / \Omega_c = 374.5 \ / \ 1.67 = 224.3 \textit{ kips}$

Calculate Shear Capacity

Critical stress is the minimum of F_{cr1}, F_{cr2}, and F_{cr3}:

$$F_{cr1} = \frac{1.23E}{\sqrt{\frac{L}{D}} \left(\frac{D}{t}\right)^{\left(5/4\right)}} = 144.8 \text{ ksi}$$

$$F_{cr2} = \frac{0.78E}{\left(\frac{D}{t}\right)^{\left(3/2\right)}} = 89.4 \text{ ksi}$$

$$F_{cr3} = 0.6F_y = 30 \text{ ksi}$$

So, $F_{cr} = 30 \textit{ ksi}$.

The nominal shear strength:

$$V_n = F_{cr} \times A_x = 30 \times 3.83 = 114.9 \text{ kips}$$

The axial capacity:

The ultimate shear capacity (LRFD) = $\phi_v V_n = 0.9 \times 114.9 = 103.4 \textit{ kips}$
The allowable shear capacity (ASD) = $V_n / \Omega_v = 114.9 \ / \ 1.67 = 68.78 \textit{ kips}$

Calculate Bending Capacity

Bending capacity in plastic yielding (compact section):

$$M_y = F_y \times Z_x = 50 \times 23.77 = 1{,}189 \text{ in} \cdot \text{kips} \quad \text{(Eq F8-1)}$$

The bending capacity for flexural yielding about the Y axis:

The ultimate bending capacity (LRFD) = $\phi_b M_y = 0.9 \times 1{,}189 = 1{,}070 \textit{ in} \cdot \textit{kips}$
The allowable bending capacity (ASD) = $M_y / \Omega_b = 1{,}189 \ / \ 1.67 = 711.7 \textit{ in} \cdot \textit{kips}$

Interaction Ratio for Bending and Compression

Check the interaction ratio for Load Case 1:

$$\frac{P_r}{P_c} = \frac{11.75}{337.0} = 0.034 < 0.2 \text{ (LRFD)}$$

$$\frac{P_r}{P_c} = \frac{11.75}{224.3} = 0.052 < 0.2 \text{ (ASD)}$$

So use Eq. H1-1b for both methods: $\frac{P_r}{2P_c} + \left(\frac{M_{rx}}{M_{cx}} + \frac{M_{ry}}{M_{cy}}\right) \le 1.0$.

$$\frac{0.034}{2} + \left(\frac{599.6}{1,070} + \frac{0}{1,070}\right) = 0.578 \text{ (LRFD)}$$

$$\frac{0.052}{2} + \left(\frac{599.6}{711.7} + \frac{0}{711.7}\right) = 0.869 \text{ (ASD)}$$

Calculate Torsion Capacity

Critical stress is the minimum of F_{cr1}, F_{cr2}, and F_{cr3}. From shear calculations, $F_{cr} = 30\ ksi$.

The nominal shear strength:

$$T_n = F_{cr} \times C = 30 \times 37.33 = 1,120 \text{ in·kips}$$

The axial capacity:

The ultimate torsional capacity (LRFD) = $\phi_T T_n = 0.9 \times 1,120 = 1,008\ in·kips$
The allowable torsional capacity (ASD) = $T_n / \Omega_T = 114.9\ /\ 1.67 = 670.6\ in·kips$

Results

Table 770:

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Compression capacity (kips)	337	337	none	
	Bending capacity (in·kips)	1,070	1,070	none	
	Shear capacity (kips)	103.4	103	negligible	
	Interaction ratio	0.578	0.578	none	
	Torsional capacity (in·kips)	1,008	1,010	negligible	
ASD	Compression capacity (kips)	224.3	224.3	none	
	Bending capacity (in·kips)	711.7	712	negligible	
	Shear capacity (kips)	68.78	68.8	negligible	
	Interaction ratio	0.869	0.869	none	

Result Type		Reference	STAAD.Pro	Difference	Comments
	Torsional capacity (in·kips)	670.6	671	negligible	

The following D1.A.6 Design Parameters (on page 1100) are used:

- The welded pipe member is specified using `STP 2`
- Shear lag factor, U for tension rupture capacity is specified by `SLF 0.8`

The remaining parameters all use their default values.

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 UPT Pipe Section.STD` is typically installed with the program.

V. AISC 360-05 W Comp and Bending H.1B

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example H.1b, p.H-3

Details

From reference (2):

> Verify if an ASTM A992 W14×99 has sufficient available strength to support the axial forces and moments listed below, obtained from a

second order analysis that includes second-order effects. The unbraced length is 14 ft and the member has pinned ends. KLx = KLy = Lb = 14.0 ft

LRFD	**ASD**
$P_u = 400$ *kips*	$P_a = 267$ *kips*
$M_{ux} = 250$ *kip-ft*	$M_{ax} = 167$ *kip-ft*
$M_{uy} = 80.0$ *kip-ft*	$M_{ay} = 53.3$ *kip-ft*

Validation

Refer to reference.

Table 771: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Interaction ratio [LRFD]	0.928	0.929	negligible	
Interaction ratio [ASD]	0.932	0.932	none

V. AISC 360-05 W D.1

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example D.1, pp.D-2,3

Details

From reference (2):

> Select an 8 in. W-shape, ASTM A992, to carry a dead load of 30 kips and a live load of 90 kips in tension. The member is 25 ft long. Verify the member strength by both LRFD and ASD with the bolted end connection shown. Verify that the member satisfies the recommended slenderness limit.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yielding $\phi_t P_n$ (kips) [LRFD]	277	277	none	
Tensile rupture $\phi_t P_n$ (kips) [LRFD]	211	211	none	
Tensile yielding P_n/Ω_t (kips) [ASD]	184	184	none	
Tensile rupture P_n/Ω_t (kips) [ASD]	141	141	none	
Slenderness ratio	238	238.212	negligible

V. AISC 360-05 W E.1C

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example E.1c, p.E-8

Details

From reference (2):

> Calculate the available strength of a W14×132 column with unbraced lengths of 30 ft in both axes. The material properties and loads are as given in Example E.1a.

From Example E.1a (also from Reference (1), p.E-4):

> ...an ASTM A992 (Fy = 50 ksi) W-shape column to carry an axial dead load of 140 kips and live load of 420 kips.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	892	893	negligible	
P_n / Ω_c (kips) [ASD]	598	594	negligible	
Slenderness ratio	95.7	95.792	negligible

V. AISC 360-05 W E.1D

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example E.1d, p.E-9

Details

From reference (2):

> Calculate the available strength of a W14×90 with a strong axis unbraced length of 30 ft and weak axis and torsional unbraced lengths of 15 ft. The material properties and loads are as given in Example E.1b. [which then references Example E.1a]

From Example E.1a (also from Reference (1), p.E-4):

> ...an ASTM A992 (Fy = 50 ksi) W-shape column to carry an axial dead load of 140 kips and live load of 420 kips.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	927	927	none	
P_n/Ω_c (kips) [ASD]	617	617	none	
Slenderness ratio	58.6	58.63	negligible

V. AISC 360-05 W Flex Memb F.1-1

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F.1-1, pp.F-6,-7

Details

From reference (2):

> Select an ASTM A992 W-shape beam with a simple span of 35 feet. Limit the member to a maximum nominal depth of 18 in. Limit the live load deflection to L/360. The nominal loads are a uniform dead load of 0.45 kip/ft and a uniform live load of 0.75 kip/ft. Assume the beam is continuously braced.

Validation

Refer to reference.

V. AISC 360-05 W Local Buckling F.3

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F.3, pp.F-20 - F-22

Details

From reference (2):

> Select an ASTM A992 W-shape beam with a simple span of 40 feet. The nominal loads are a uniform dead load of 0.05 kip/ft and two equal 18 kip concentrated live loads acting at the third points of the beam. The beam is continuously braced. Also calculate the deflection.

Validation

Refer to reference.

V. AISC 360-05 W LTB Test F.1-2

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F.1-2, pp.F-8,9

Details

From reference (2):

> Verify the strength of the W18×50 beam selected in V. AISC 360-05 W Flex Memb F.1-1 (on page 5642) if the beam is braced at the ends and third points rather than continuously braced.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	305	306	negligible	
M_n / Ω_b (ft·k) [ASD]	203	203	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 W LTB Test F.STD` is typically installed with the program.

V. AISC 360-05 W Memb Selection F.4

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F.4, pp.F-23,24

Details

From reference (2):

> Select an ASTM A992 W-shape flexural member by the moment of inertia, to limit the live load deflection to 1 in. The span length is 30 ft. The nominal loads are a uniform dead load of 0.80 kip/ft and a uniform live load of 2 kip/ft. Assume the beam is continuously braced.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
Selected section [LRFD]	W24x55	W24x55	none

V. AISC 360-05 W Section Weak Axis Shear G-6

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example G.6, p.G-11

Details

From reference (2):

Verify the strength of a W21×48 ASTM A992 beam with end shears of 20 kips from dead load and 60 kips from live load in the weak direction.

Validation

Refer to reference.

Table 772: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	189	189	none	
V_n / Ω_v (kips) [ASD]	126	126	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 W Section Weak Axis Shear G-6.STD` is typically installed with the program.

V. AISC 360-05 W Shape Strong Axis Shear G-1

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example G.1, pp.G-3,4

Details

From reference (2):

> Verify the shear strength of a W24×62 ASTM A992 beam with end shears of 48 kips from dead load and 145 kips from live load.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_v V_n$ (kips) [LRFD]	306	306	none	
V_n / Ω_v (kips) [ASD]	204	204	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 W Shape Strong Axis Shear G-1.STD` is typically installed with the program.

V. AISC 360-05 W Tens and Bending H3

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example H.3, pp.H-6

Details

From reference (2):

Select an ASTM A992 W-shape with a 14-in. nominal depth to carry nominal forces of 29 kips from dead load and 87 kips from live load in axial tension, as well as the following nominal moments:

M_{xD} = 32.0 kip-ft	M_{xL} = 96.0 kip-ft
M_{yD} = 11.3 kip-ft	M_{yL} = 33.8 kip-ft

The unbraced length is 30 ft and the ends are pinned. Assume the connections are made with no holes.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
Interaction ratio per H1-1b [LRFD]	0.874	0.874	negligible	
Interaction ratio per H1-1b [ASD]	0.876	0.876	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 W Tens and Bending H3.STD` is typically installed with the program.

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example D.3, pp.D-6,7

Details

From reference (2):

> A WT6×20, ASTM A992, member has a length of 30 ft and carries a dead load of 40 kips and a live load of 120 kips in tension. Assume the end connection is fillet welded and has a length of 16 in. Verify the member strength by both LRFD and ASD. Assume that the gusset plate and the weld have been checked and are satisfactory.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
Tensile yielding $\phi_t P_n$ (kips) [LRFD]	263	263	none	
Tensile rupture $\phi_t P_n$ (kips) [LRFD]	266	266	none	
Tensile yielding P_n/Ω_t (kips) [ASD]	175	175	none	
Tensile rupture P_n/Ω_t (kips) [ASD]	177	177	none	
Slenderness ratio	229	230.607	negligible

V. AISC 360-05 WT E.7

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example E.7, pp. E-31 - E-33

Details

From reference (2):

> Select a WT-shape compression member with a length of 20 ft to support a dead load of 20 kips and live load of 60 kips in axial compression. The ends are pinned.

Validation

Refer to reference.

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_c P_n$ (kips) [LRFD]	128	127	negligible	
P_n / Ω_c (kips) [ASD]	85.0	84.3	negligible	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 WT E.STD` is typically installed with the program.

V. AISC 360-05 WT Shape F.10

References

1. *Steel Construction Manual*, Version 13.0, American Institute of Steel Construction, 2005
2. *Design Examples*, Version 13.0, American Institute of Steel Construction, 2005, Example F.10, pp.F-37,38

Details

From reference (2):

Select an ASTM A992 WT beam with a simple span of 6 ft. The toe of the stem of the WT is in tension. The nominal loads are a uniform dead load of 0.08 kip/ft and a uniform live load of 0.24 kip/ft. There is no deflection limit for this member. Assume full lateral support.

Validation

Ultimate moment:

$$w_u = 1.2(0.08\text{ k/ft}) + 1.6(0.24\text{ k/ft}) = 0.48\text{ k/ft}$$

$$M_u = \frac{0.48(6)^2}{8} = 2.16\text{ ft-k}$$

Service moment:

$$w_a = 0.08\text{ k/ft} + 0.24\text{ k/ft} = 0.32\text{ k/ft}$$

$$M_a = \frac{0.32(6)^2}{8} = 1.44\text{ ft-k}$$

Try a WT5×6, which has a plastic section modulus, $Z_x = 2.20\ in^3$ and a section modulus, $S_x = 1.22\ in^3$.

Flexural Yielding

$$M_n = M_p = F_y \times Z_x = 50 \times 2.20 = 110\text{ in}\cdot\text{k} < 1.6F_y S_x = 1.6 \times 50 \times 1.22 = 97.6\text{ in-k}\ \text{(F9-2)}$$

Lateral-torsional buckling does not govern since the member is continuously braced.

Flange compactness: $\lambda = {}^{b_f}\!/_{2t_f} = 9.43$

Determine the compact and slender flange ratio limits from Table B4.1b:

$$\lambda_{pf} = 0.38\sqrt{\frac{E}{F_y}} = 0.38\sqrt{\frac{29{,}000}{46}} = 9.15$$

$$\lambda_{rf} = 1.0\sqrt{\frac{E}{F_y}} = 1.0\sqrt{\frac{29{,}000}{46}} = 24.1$$

Thus, the section has a non-compact flange.

$$M_n = \left[M_p - (M_p - 0.7F_y S_{xc})\left(\frac{\lambda - \lambda_{pf}}{\lambda_{rf} - \lambda_{pf}}\right)\right] = \ = \left[110 - (110 - 0.7 \times 50 \times 3.20)\left(\frac{9.43 - 9.15}{24.1 - 9.15}\right)\right] = 110\text{ in}\cdot\text{k} >$$

So use $M_n = 97.6\ in \cdot k = 8.13\ ft \cdot k$

The available flexural strength:

LRFD: $\phi_b M_n = 0.90(8.13) = 7.32\ ft \cdot k$

ASD: $M_n / \Omega_b = {}^{8.13}\!/_{1.67} = 4.87\ ft \cdot k$

Result Type	Reference	STAAD.Pro	Difference	Comments
$\phi_b M_n$ (ft·k) [LRFD]	7.32	7.21	1.5%	
M_n/Ω_b (ft·k) [ASD]	4.87	4.80	1.5%	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC 360-05 WT Shape F.STD` is typically installed with the program.

V. AISC ASD - Column Compression Capacity 1

Determine the axial compression capacity of a W14X132 column.

Reference

AISC Allowable Stress Design, 9th Edition, Example 1, page 3-4.

Related Links

- *D1.B.1.1 Allowables per AISC Code* (on page 1130)

Problem

F_y =36 ksi

K_yL_y =16ft

K_zL_z = 31ft

Comparison

The reported STAAD.Pro value is obtained by multiplying FA times AX from the STAAD.Pro output:

17.36 ksi (38.8 in^2) = 673.6 kips

Result Type	Reference	STAAD.Pro	Difference
Allowable load (kips)	679	673.6	0.8%

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC ASD - Column Compression Capacity 1.STD` is typically installed with the program.

V. AISC ASD - Column Compression Capacity 3

Determine the axial compression capacity of a W12X40 column.

Reference

AISC Allowable Stress Design, 9th Edition, tables on page 3-28.

Related Links

- *D1.B.1.1 Allowables per AISC Code* (on page 1130)

Problem

F_y =36 ksi

$K_yL_y = K_zL_z = 16ft$

Comparison

The reported STAAD.Pro value is obtained by multiplying FA times AX from the STAAD.Pro output = *12.97(11.70) = 151.7*.

Table 774: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Axial capacity (kips)	154	151.7	1.5%

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC ASD - Column Compression Capacity 3.STD` is typically installed with the program.

V. AISC ASD - Rectangular Tube Compression Capacity

Determine the axial compression capacity of a rectangular 7x5x3/8 structural tube.

Reference

AISC Allowable Stress Design, 9th Edition, tables on page 3-49.

Related Links

- *D1.B.1.1 Allowables per AISC Code* (on page 1130)

Problem

F_y =46 ksi

$K_yL_y = K_zL_z$ = 25ft

Comparison

The reported STAAD.Pro value is obtained by multiplying FA times AX from the STAAD.Pro output = *6.32(8.08) = 51.06*.

Table 776: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Axial capacity (kips)	51	51.1	<1%

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC ASD - Rectangular Tube Compression Capacity.STD` is typically installed with the program.

V. AISC ASD - Beam Load Capacity 3

Determine the bending (transverse load carrying) capacity of a W10X45 shape.

Reference

AISC Allowable Stress Design, 9th Edition, Example 5, page 2-34.

Related Links

- *D1.B.1.1 Allowables per AISC Code* (on page 1130)

Problem

F_y =36 ksi

L_u = 6ft

Comparison

The reported STAAD.Pro value is obtained by dividing the applied load (using the table capacity) by the reported STAAD.Pro critical ratio = *17/1.002 = 16.97*.

Table 778: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Allowable uniform load (kips/ft)	17	16.97	none

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC ASD - Beam Load Capacity 3.STD` is typically installed with the program.

V. AISC ASD - Wide Flange Beam Load Capacity 2

Determine the bending (transverse load carrying) capacity of a W16x40 shape.

Reference

AISC Allowable Stress Design, 9th Edition, Example1, page 2-5.

Related Links

- *D1.B.1.1 Allowables per AISC Code* (on page 1130)

Problem

F_y =36 ksi

L_{uc} = 9ft (Unbraced length of compression flange)

Comparison

The reported STAAD.Pro value is obtained by multiplying the FCZ and SZ values from the STAAD.Pro output = $21.60(64.71) = 1397.7$ *in·kip* $= 116.5$ *ft·kips*.

Table 780: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Bending capacity (ft·kips)	116.5	116.5	none

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC ASD - Wide Flange Beam Load Capacity 2.STD` is typically installed with the program.

V. AISC ASD - MC Beam Load Capacity

Determine the bending (transverse load carrying) capacity of an MC18x58 channel. The beam is laterally supported along its entire length.

Reference

AISC Allowable Stress Design, 9th Edition, tables, page 2-80.

Related Links

- *D1.B.1.1 Allowables per AISC Code* (on page 1130)

Problem

F_y =36 ksi

L = 25ft

Comparison

The reported STAAD.Pro value is obtained by dividing the applied load (using the table capacity) by the reported STAAD.Pro critical ratio $=43/0.995 = 43.2$.

Table 781: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Total allowable uniform load (kips/ft)	43	43.2	0.5%

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC ASD - MC Beam Load Capacity.STD` is typically installed with the program.

V. AISC ASD - Wide Flange Beam Load Capacity 3

Determine the bending (transverse load carrying) capacity of a W16x45 shape.

Reference

AISC Allowable Stress Design, 9th Edition, tables, page 2-80.

Related Links

- *D1.B.1.1 Allowables per AISC Code* (on page 1130)

Problem

F_y =36 ksi

L =20ft

L_{uc} = 5ft (Unbraced length of compression flange)

Comparison

The reported STAAD.Pro value is obtained by dividing the applied load (using the table capacity) by the reported STAAD.Pro critical ratio $=58/1.008 = 57.54$.

Table 782: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Total allowable uniform load (kips)	58	57.54	<1%

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC ASD - Wide Flange Beam Load Capacity 3.STD` is typically installed with the program.

V. AISC ASD - Select Wide Flange Beam 2

Determine a 14in deep section to carry a load of 1 kip/ft over a span of 25 ft.

Reference

AISC Allowable Stress Design, 9th Edition,Example 7, page 2-35.

Related Links

- *D1.B.1.1 Allowables per AISC Code* (on page 1130)

Problem

The beam is laterally supported throughout its length.

F_y =36 ksi

V. AISC ASD - Compression and Biaxial Bending

Determine the suitability of a W14x109 shape to resist axial compression and biaxial bending.

Reference

AISC Allowable Stress Design, 9th Edition,Example 4, page 3-11.

Related Links

- *D1.B.1.1 Allowables per AISC Code* (on page 1130)

Problem

P =200 kips

M_z = 120 ft ·kips (strong axis)

M_y = 40 ft ·kips (weak axis)

KL = 14 ft

C_m= 0.85

Maximum unbraced length of compression flange is 15 ft.

Comparison

Table 786: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Selected section	OK	OK (stress ratio = 0.93)	none

STAAD Input

V. AISC ASD - 2D Frame Validation

Determine the allowable stresses (per 1989 AISC code) for the members of the structure as shown in the figure. Also, perform a code check for these members based on the results of the analysis.

Reference

Attached step by step hand calculation as per 1989 AISC ASD code. Ninth Edition.

Related Links

- *D1.B.1.1 Allowables per AISC Code* (on page 1130)

Problem

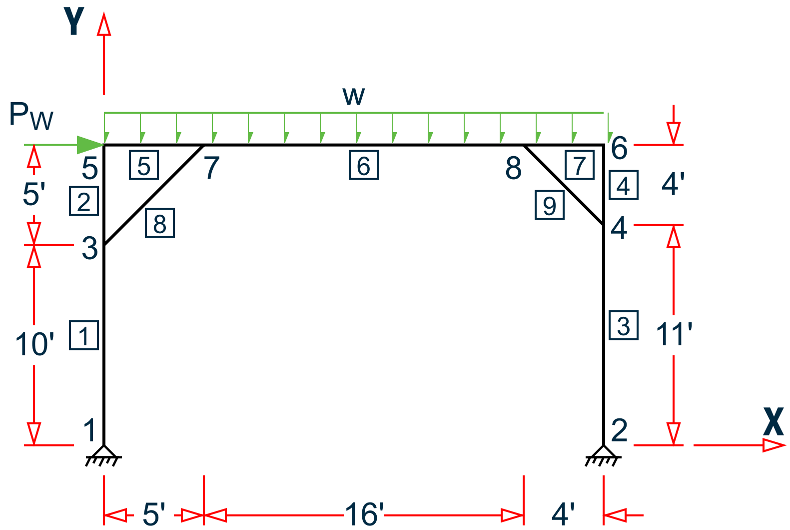

Figure 502: Steel braced frame

Members 1, 2 = W12X26, Members 3, 4 = W14X43

Members 5, 6, 7 = W16X36, Memb 8= L40404, Memb 9 = L50506

F = 15 kip (wind load)

w = 2 kip/ft (dead load + live load)

Steel: Fy = 36ksi

Hand Calculation

Manual / Code refers to AISC Manual of Steel Construction, Allowable Stress Design, ninth edition.

Member 1

Size W12x26, L = 10 ft., a = 7.65 in^2, S_z = 33.39 in^3

Per Section F2 is the lower value for the yielding and lateral-torsional buckling limit states:

Mn = Mp = FyZx = 36ksi × 37.2 in^3 = 1,339 in·k = 111.3 ft·k

$$L_p = 1.76 r_y \sqrt{\frac{E}{F_y}} = 1.76(1.51\text{in})\sqrt{\frac{29,000\text{ksi}}{36\text{ksi}}} = 75.4\text{in}$$

From clause F1-2, page 5-45 of Manual, L_c = 6.85 ft.

From observation Load case 1 will govern,

F_x = 25.0 kip (compression), M_z = 56.5 ft·kip

Area of compressive flange = 6.49*0.38 = 2.466 in^2

Allowable bending stress, per Clause F1-8 (page 5-47 of Manual)

$$f_b = 12. \cdot 1000 \cdot 1.0/[10 \cdot 12 \cdot (12.22/2.466)] = 20.1817 \text{ ksi}$$

$$(kl/r)y = 120/1.5038 = 79.8, \text{ so } f_a = 15.38 \text{ ksi}$$

Stresses per Table C-36 (page 3-16 of manual)

$$f_a = 25./7.65 = 3.268$$

$$f_b = 56.5 \cdot 12/33.39 = 20.31 \text{ ksi}$$

$$(kl/r)z = 120/5.1639 = 23.238, \text{ so } F'_{ez} = = 276.54 \text{ ksi}$$

Equation H1-1, page 5-54 of Manual

$$3.268/15.38 + 0.85 \cdot 20.31 / [(1-3.268/276.54) \cdot 20.1817] = 1.078$$

Equation H1-2, page 5-54 of Manual.

$$3.268/(0.6 \cdot 36) +20.31/20.1817 = 1.1576$$

Therefore, equation H1-2 governs and ratio = 1.1576

Member 2

Size W12x26, L = 5 ft., a = 7.65 in^2, Sz = 33.39 in^3

From observation load case 1 will govern,

F_x = 8.71 kip (compression), M_z = 56.50 ft·kip

Since L is less than L_c = 6.85ft, per Clauses F1-1 & F1-2 (page 5-45 of Manual)

$$f_b = 0.66 \cdot 36 = 23.76 \text{ ksi}$$

$$(kl/r)y = 60/1.5038 = 39.90, \text{ so } f_a = 19.19 \text{ ksi}$$

Per Table C-36 (page 3-16 of Manual)

$$f_a = 8.71/7.65 = 1.1385, f_b = 56.5 \cdot 12/33.39 = 20.31 \text{ ksi}$$

Since f_a/F_a less than 0.15, apply equation H1-3 (page 5-54 of Manual)

$$1.1385/19.19 + 20.31/23.76 = .0593 + .8548 = 0.9141$$

Member 3

Size W14X43, L = 11ft., a = 12.6 in^2, Sz = 62.7 in^3

From observation load case 3 will govern,

F_x = 25.5 kip (compression), M_z = 112.173 ft·kip

Referring to clause F1-2, page 5-45 of Manual.

L_c = 8.4 ft. Therefore

$f_b = 0.6 \cdot 36 = 21.6$ ksi

$(kl/r)y = 132/1.8941 = 69.69$,

so f_a = 16.46 ksi per Table C-36 (page 3-16 of Manual)

$f_a = 25.5/12.6 = 2.024$

$f_b = 112.173 \cdot 12/62.66 = 21.48$ ksi

since f_a/F_a less than 0.15, use equation H1-3, page 5-54 of Manual

$2.024/16.46 + 21.48/21.6 = 0.123 + 0.994 = 1.117$

Member 4

Size W14x43, L = 4ft, a = 12.6 in^2, Sz = 62.7 in^3

From observation, load case 3 will govern,

F_x = 8.75 kip (tension), M_z = 112.173 ft·kip

Since L is less than L_c = 8.4 ft

$f_b = 0.66 \cdot 36 = 23.76$ ksi

Clause F1-1 (page 5-45 of Manual)

$f_a = 8.75/12.6 = 0.694$

$f_b = 112.73x12/62.66 = 21.48$ ksi

Combined tension and bending, use equation H2-1, page 5-55 of Manual.

$0.694/(0.6 \cdot 36) + 21.48/23.76 = 0.032 + 0.904 = 0.936$

Member 5

Size W16x36, L = 5ft, a = 10.6 in^2, Sz = 56.49 in^3

From observation, load case 3 will govern.

F_x = 14.02 kip (compression), M_z =57.04 ft·kip

Since L is less than L_c = 7.37 (per Clause F1-2, page 5-45 of Manual)

$f_b = 0.66 \cdot 36 = 23.76$ ksi

$(kl/r)y = 60./1.52 = 39.47$

so f_a = 19.23 ksi per Table C-36 (page 3-16 of Manual)

$f_a = 14.02/10.6 = 1.32$

$f_b = 57.04 \cdot 12/56.5 = 12.12$ ksi

Since f_a/F_a less than 0.15, use equation H1-3, page 5-54 of Manual

$1.32/19.23 + 12.12/23.76 = 0.069 + 0.510 = 0.579$

Member 6

Size W16x36, L = 16ft, a = 10.6 in^2, Sz = 56.49 in^3

From observation, load case 1 will govern. Forces at midspan are

F_x = 5.65 kip (compression), M_z = 71.25 ft·kip

From Chapter F of the AISC ASD 9P$^{th\ P}$ ed. specs., with Cb = 1.0,

$(102{,}000Cb/Fy)^{1/2}$ =53.229

$(510{,}000Cb/Fy)^{1/2}$ =119.02

L/rT = 192/1.79 = 107.26

53.229 < 107.26 < 119.02

Therefore F_b (as per F1-6, page 5-47 of Manual)

[(2/3) – 36 · 107.26 · 107.26/(1,530,000)] · 36 = 14.25 ksi

(Kl/r)y = 192/1.5203 = 126.29

so f_a = 9.36 per Table C-36 (page 3-16 of Manual)

f_a = 5.65/10.6 = 0.533

f_b = 71.25x12/56.49 = 15.14 ksi

Since f_a/F_a less than 0.15 use formula [H1-3, page 5-54 of Manual]

0.533/9.36 + 15.14/14.25 = 0.057 + 1.062 = 1.119

Member 7

Size W16x36, L =4ft, a = 10.6in^2, Sz =56.49in^3

L_c = 7.37ft (Clause F1-2 page 5-45 of Manual)

From observation load case 3 will govern, F_x = 24.06 kip (tension), M_z = 62.96 ft·kip

From Clause F1-1, the allowable compressive stress is

f_b = 0.66 Fy = 23.76 ksi

Since section is in tension, per Clause F1-5 (page5-45 of Manual)

f_b = 0.60 · 36 = 21.60 Ksi

Choosing the larger of above 2 values, f_b = 23.76 Ksi

f_a = 24.06/10.6 = 2.2698

f_b = 62.96 · 12/56.49 = 13.37

Since combined tension and bending, use equation H 2-1, page 5-55 of the AISC ASD 9P$^{th\ P}$ ed. specs.

2.2698/(0.6 · 36) + 13.37(23.76) = 0.105 + 0.5627 = 0.6677

Member 8

Size L4x4x1/4, L = 7.071 ft, a = 1.94 in^2

From observation load case 1 will govern, F_x = 23.04 kip (Comp.)

Fa is computed as per page 5-310 of the AISC ASD 9P$^{th\ P}$ ed.specs.

$Q_s = 1.34 – 0.00447 \cdot (4/0.25) \cdot (36)^{1/2} = 0.9108$

Q_a = 1.0

$Q = Q_s \cdot Q_a = 0.9108$

$C_c = 92.0 \cdot \pi^2 \cdot E/(Q \cdot F_y)]^{1/2} = [2.0 \cdot \pi^2 \cdot 29000/(0.9108 \cdot 36)]^{1/2} = 132.1241$

$Kl/r = 7.071 \cdot 12/0.795 = 106.73 < C_c$.

Hence, f_a = 11.6027 ksi (computed per equation 4-1)

Actual compressive stress

$f_a = 23.04/1.94 = 11.876$ ksi

Therefore, Ratio =

$f_a/f_a = 11.876/11.602 = 1.024$

Member 9

Size L5x5x3/8, L = 5.657 ft, a = 3.61 in^2

From observation, load case 1 governs, F_x = 48.44 kip (Comp.)

Fa is computed as per page 5-310 of the AISC ASD 9P$^{th\ P}$ ed. specs.

$Q_s = 1.34 – 0.00447 \cdot (5/0.375) \cdot (36)^{1/2} = 0.9824$

$Q_a = 1.0$

$Q = Q_s \cdot Q_a = 0.9824$

$C_c = 92.0 \cdot \pi^2 \cdot E/(Q \cdot F_y)]^{1/2} = [2.0 \cdot \pi^2 \cdot 29000/(0.9824 \cdot 36)]^{1/2} = 127.2238$

$(Kl/r)min = 5.657 \cdot 12/0.99 = 68.57 < C_c$.

Hence, f_a = 16.301 ksi (computed per equation 4-1)

Actual compressive stress

$f_a = 48.44/3.61 = 13.418$ ksi

Therefore Ratio =

$f_a/f_a = 13.418/16.301 = 0.823$

Comparison

V. AISC ASD - Design of Steel Beam with Web Opening

Design the web reinforcement for a web opening in a steel beam.

Details

Note: The design at locations where openings are not present is not shown in this example.

Design Method : ASD

Beam No : 5

Beam Section : W21X50

d = 20.83 in
t_w = 0.38 in
b_f = 6.53 in
t_f = 0.535 in
Z = 110 in^3
L = 10 ft

Weld Properties : E90XX

F_y,weld = 90 ksi

Weld Stress = 54 ksi

Opening Type: Rectangular

Number of openings : 1

Section location of Opening : 0.6
a_0 = 20 in
h_0 = 10 in
e = 0 in (concentric opening)
F_y = 36 ksi

Capacity check at web hole assuming an unreinforced opening:

Loading :

V_u = 34.46 kip
M_u = 2,510.7 kip-inch

Tee Properties :

s_t = 5.415 in
s_b = 5.415 in

Validation

Check for local buckling of compression flange :

width to thickness ratio $F_1 = \frac{b_f}{2t_f} = 6.1028$

limiting ratio $= \frac{65}{\sqrt{F_y}} = 86.667 > F_1$ Hence O.K

Check for web buckling :

width to thickness ratio of web $W_1 = \frac{\left(d - 2t_f\right)}{t_w} = 52$

limiting ratio $= \frac{520}{\sqrt{F_y}} = 86.667 > W_1$ Hence O.K

Check for opening dimensions to prevent web buckling :

Since $W_1 \le \frac{420}{\sqrt{F_y}} = 70$, $a_0 / h_0 = 2 < 3.0$

$h_0 / d = 0.4801 < 0.7$

Opening parameter $p_0 = \frac{a_0}{h_0} + \frac{6h_0}{d} = 4.8805 < 5.6$ Hence OK

Check for Tee dimension :

$$s_t = \frac{d}{2} - \left(\frac{h_0}{2} + e\right) = 5.415\text{in.} \ge 0.15d = 3.1245\text{in.}$$

$$s_b = \frac{d}{2} - \left(\frac{h_0}{2} - e\right) = 5.415\text{in.} \ge 0.15d = 3.1245\text{in.}$$

Aspect Ratio:

$v_t = \frac{a_0}{s_t} = 3.6934 < 12.0$,

$v_b = \frac{a_0}{s_b} = 3.6934 < 12.0$ Hence OK

Calculation of Maximum Moment Capacity :

For unperforated section $M_p = F_y Z = 3{,}960$ *kip-inch*

$$\Delta A_s = h_0 t_w = 3.8 \text{ in}^2$$

$M_m = M_p\left[1 - \frac{\Delta A_s\left(h_0 / 4 + e\right)}{Z}\right] = 3,\ 618 kip\text{-}in \le M_p$ Hence OK

Calculation of Maximum Shear Capacity

$$V_{pb} = \frac{F_y t_w s_b}{\sqrt{3}} = 42.768\text{kips}$$

$$V_{pt} = \frac{F_y t_w s_t}{\sqrt{3}} = 42.768\text{kips}$$

For unreinforced opening :

$$\mu_b = 0,\ \mu_t = 0$$

Ratio of nominal shear capacity of tees :

$$\alpha_{vb} = \frac{\sqrt{6} + \mu_b}{v_b + \sqrt{3}} = 0.4515 \le 1.0$$

$$\alpha_{vt} = \frac{\sqrt{6} + \mu_t}{v_t + \sqrt{3}} = 0.4515 \le 1.0$$

Hence OK

$$V_{mb} = V_{pb}\alpha_{vb} = 19.309 \text{ kips}$$

$$V_{mb} = V_{pb}\alpha_{vb} = 19.309 \text{ kips}$$

$Vm = V_{mb}+V_{mb} = 38.618$ *kips* Hence OK

Check against Maximum Shear capacity :

$$V_p = \frac{F_y t_w d}{\sqrt{3}} = 164.52\text{kips}$$

Since $W_1 \le \frac{420}{\sqrt{F_y}}$, $V_m \le \frac{2}{3}V_p = 109.68kips$ Hence OK

Check against Moment Shear Interaction:

$$R_1 = \frac{V_u}{\phi V_m} = 0.8923 \le 1.0$$

$$R_2 = \frac{M_u}{\phi M_m} = 0.6939 \le 1.0$$

$$R = \sqrt[3]{R_1^3 + R_2^3} = 1.0147 > 1.0$$

Not OK... Try with a Reinforced web opening .

Capacity check at web hole assuming a reinforced opening:

Reinforcement should be selected to reduce R to 1.0

Let us assume,

Thickness of Reinforcement $t_r = 0.1875\ in$
Width of Reinforcement $b_r = 0.25\ in$

Check for local buckling of compression flange :

width to thickness ratio of web reinforcement $F_2 = \frac{b_r}{t_r} = 1.3333$

limiting ratio $= \frac{65}{\sqrt{F_y}} = 10.833 > F_2$ Hence O.K

Area of Reinforcement $A_r = t_r b_r = 0.0469\ in^2$

Calculation of Maximum Moment Capacity :

For unperforated section $M_p = F_y Z = 3{,}960$ *kip-inch*

$$\Delta A_s = h_0 t_w - 2A_r = 3.7063 \text{ in}^2$$

Since $t_w e = 0 < A_r$

$M_m = M_p\left[1 - \frac{t_w\left(h_0^2 / 4 + h_0 e - e^2\right) - A_r h_0}{Z}\right] = 3,\ 634.88kip\text{-}in \le M_p$ Hence OK

Calculation of Maximum Shear Capacity :

$$V_{pb} = \frac{F_y t_w s_b}{\sqrt{3}} = 42.768\text{kips}$$

$$V_{pt} = \frac{F_y t_w s_t}{\sqrt{3}} = 42.768\text{kips}$$

$$s_{t1} = s_t - \frac{A_r}{2b_f} = 5.4114\text{in}$$

$$s_{b1} = s_b - \frac{A_r}{2b_f} = 5.4114\text{in}$$

$P_r = F_y A_r = 1.6875 \le \frac{F_y t_w a_0}{2\sqrt{3}} = 78.982kips$ Hence Ok

$$d_{rt} = s_t - \frac{1}{2}t_r = 5.3213$$

$$d_{rb} = s_b - \frac{1}{2}t_r = 5.3213$$

$$v_t = \frac{a_0}{s_{t1}} = 3.6959 < 12.0 \text{ , } \mu_t = \frac{2P_r d_{rt}}{V_{pt} s_t} = 0.0775$$

$$v_b = \frac{a_0}{s_{b1}} = 3.6959 < 12.0 \text{ , } \mu_b = \frac{2P_r d_{rb}}{V_{pb} s_b} = 0.0775$$

$$a_{vb} = \frac{\sqrt{6} + \mu_b}{v_b + \sqrt{3}} = 0.4656 \le 1.0$$

$$a_{vt} = \frac{\sqrt{6} + \mu_t}{v_t + \sqrt{3}} = 0.4656 \le 1.0$$

Hence OK

$$V_{mb} = V_{pb}\alpha_{vb} = 19.911 \text{ kips}$$

$$V_{mt} = V_{pt}\alpha_{vt} = 19.911 \text{ kips}$$

$$V_m = V_{mb} + V_{mt} = 39.823 \text{ kips}$$

Check against Maximum Shear capacity :

$$V_p = \frac{F_y t_w d}{\sqrt{3}} = 164.52\text{kips}$$

Since $W_1 \le \frac{420}{\sqrt{F_y}}$, $V_m \le \frac{2}{3}V_p = 109.68kips$ kips Hence OK

Check against Moment Shear Interaction :

$$R_1 = \frac{V_u}{\phi V_m} = 0.8653 \le 1.0$$

$$R_2 = \frac{M_u}{\phi M_m} = 0.6907 \le 1.0$$

$R = \sqrt[3]{R_1^3 + R_2^3} = 0.9924 < 1.0$ Hence OK

Calculation of length of Fillet Weld :

$$A_f = b_f t_f = 3.4936 \text{ in}^2$$

For reinforcing bars on one side of the web :

$A_r \le \frac{A_f}{3} = 1.1645 in^2$ Hence OK

$a_0 / h_0 = 2 \le 2.5$ Hence OK

$V_1 = \frac{s_t}{t_w} = 14.25$, $V_2 = \frac{s_b}{t_w} = 14.25$

$V_1 and V_2 \le \frac{140}{\sqrt{F_y}} = 23.333 kips$ Hence OK

$\frac{M_u}{V_u d} = 3.4977 \le 20$ Hence OK

$R_{w1} = \phi 2 P_r = 3.375 kips$ (strength of weld within the length of the opening)

$L_1 = max\left(\frac{a_0}{4}, \frac{A_r \sqrt{3}}{2t_w}\right) = 5in$ (length extended on each side of the opening)

Thus, Length of bar = $a_0 + 2L_1 = 30\ in$

$R_{w2} = \phi F_y A_r = 1.6875 kips$ (strength of weld for extension on each side of opening)

Strength of Weld $R_{wr} = max(R_{wr1}, R_{wr2}) = 3.375\ kips$

Fillet Weld Size = $0.0044\ in$ (rounded to nearest weld size of 0.0625 in = 1/16 in)

Corner Radii :

Minimum Radii $= max\left(2t_w, \frac{5}{8}\right) = 0.76in$

Results

Table 789: Web opening design for member no. 5

Result Type		Reference	STAAD.Pro	Difference	Comments
Interaction Ratio, R		0.99	1.00	negligible	
Reinforcement bar (required at web opening)	Length, in	30	30	none	
	Width, in	0.25	0.25	none	
	Thickness, in	0.1875	0.1875	none	
Fillet Weld Size, in		1/16	0.0625 (1/16")	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\` is typically installed with the program.

- *D1.B.3 Design of Beams with Web Openings* (on page 1157)

V. AISC ASD - Deflection Check for a Steel Beam with Web Opening

Determine the deflection of a beam with a web opening.

Details

Design Method : ASD

Beam No : 5

Beam Section : W21X50

$d = 20.83$ in
$t_w = 0.38$ in
$b_f = 6.53$ in
$t_f = 0.535$ in
$Z = 110\ in^3$
$L = 30$ ft
$E = 29,732$ ksi

Opening Type: Rectangular

Number of openings : 1

Section location of Opening, $s_{open} = 0.3$
$a_0 = 20$ in
$h_0 = 10$ in
$e = 0$ in (concentric opening)
$F_y = 36$ ksi

Loading at critical location:

$V_u = 9.51$ kip
$M_u = 344.36$ kip-inch

Location of maximum deflection from start of the member : $L_{critical} = 120\ in$

Tee Properties :

$s_t = 5.415$ in
$s_b = 5.415$ in
Moment Area = $\frac{b_f t_f^2}{2} + t_w\left(s_t - t_f\right)\left(\frac{s_t t_f}{2} + t_f\right) = 6.4514in^3$
Area = $b_f t_f + t_w(s_t - t_f) = 5.34795\ in^2$
C_{yt} = Moment Area / Area = 1.20632 in.
$I_{zz,t} = I_{zz,b} = \frac{b_f t_f^3}{12} + b_f t_f\left(C_y - \frac{t_f}{2}\right)^2 + \frac{t_w(s_t - t_f)^3}{12} + t_w\left(s_t - t_f\right)\left(c_y - t_f - \frac{s_t - t_f}{2}\right)^2 = 12.644in^3$
(concentric opening)
$I_{zz} = I_{zz,t} + I_{zz,b} = 25.2872\ in^3$

Validation

$$R_t = \frac{I_{zz,b}}{I_{xx}} = 0.5$$

$$R_b = \frac{I_{zz,t}}{I_{xx}} = 0.5$$

$V_t = F_y R_t = 4.755$

$V_b = F_y R_b = 4.755$

$$\Delta_{0t} = \frac{V_t a_0^3}{6EI_{zz,t}} = 0.01686\text{in}$$

$$\Delta_{0b} = \frac{V_b a_0^3}{6EI_{zz,b}} = 0.01686\text{in}$$

$$\Delta_0 = \Delta_{0b} + \Delta_{0b} = 0.03373 \text{ in}$$

L_0 = distance from high moment end of opening to adjacent support $= L - s_{open}L - \frac{a_0}{2} = 314 in$

L_2 = distance from support to the point where deflection is maximum = L_0 - $L_{critical}$ = $240\ in$

$L_3 = L_0 - L_2 = 74\ in$

$$\Delta_{p1} = \Delta_0 \frac{L_2}{L_0} = 0.02578\text{in}$$

$$\theta_H = \frac{\Delta_0}{L_0} = 0.00011$$

$$\theta_T = \frac{V a_0^2}{4EI_{zz}} = 0.00126$$

$$\Delta_{p2} = \frac{2L_2 L_3(\theta_H + \theta_T)}{L_0 + L_2} = 0.08799$$

$\Delta = \Delta_{p1} + \Delta_{p2} = 0.11377\ in$ (extra deflection due to opening)

displacement factor: $\Delta_{factor} = 750$

$$\Delta_{allow} = \frac{L}{\Delta_{factor}} = 0.48\text{in}$$

Ratio of $\Delta_{actual}/\Delta_{allow} = 0.66$ (without web opening)

Thus, $\Delta_{actual} = 0.3168\ in$ (from analysis considering stiffness of unperforated member without web opening)

Total deflection considering the effect of web hole,

$\Delta_{actual,wb} = \Delta + \Delta_{actual} = 0.4306$ in

$$\text{Ratio} = \frac{\Delta_{actual,wb}}{\Delta_{allow}} = 0.897$$

Results

Table 790: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Interaction Ratio, R	0.897	0.899	< 1%	
Total deflection, in	0.4306	0.4315*	< 1%	

* STAAD.Pro does not directly report the deflection, but rather the ratio of deflection with length, dff, for comparison with a limiting displacement factor.

$$\Delta_{actual,wb} = L / dff = 360 \text{ in} / 834.32 = 0.4315 \text{ in}$$

Note: The member length used for deflection calculations is defined using the start deflection joint number, `DJ1`, and end deflection joint number, `DJ2`. These are assigned to the member in the design code parameters. STAAD.Pro uses this to calculate the physical member length rather than the segment length of the analytical member for deflection checks.

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\` is typically installed with the program.

Problem

Assume the reduction in area due to bolt holes to be equivalent to a net section factor of 0.72.

$F_y = 50$ ksi

L =10ft

Hand Calculation

Net section = $0.72(7.08 in.^2) = 5.11\ in.^2$

$$\phi P_n = \begin{cases} \phi_t F_y A_g = 0.9(50ksi)(7.08in.^2) = 318.6k \\ \phi_t F_u A_e = 0.75(65ksi)(5.11in.^2) = 248.5k \end{cases}$$

Comparison

The reported STAAD.Pro value is based on the term PNT in the STAAD.Pro output.

Table 791: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Design strength (kips)	248.5	248.51	none

Note: The assumed NSF of 0.72 is comparable to the term Ae/Ag which evaluates to 5.11/7.08.

V. AISC LRFD - Wide Flange Compression Capacity 1

To determine the capacity of W14X132 column in axial compression.

Reference

Hand calculation using the following reference:

AISC Load Factor Resistance Design, 3rd Edition, Example 4.1, case (a), page 4-7.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Problem

The column is braced at its ends for both axes.

F_y =50 ksi

Length = 30 ft

Hand Calculation

Net section = $0.795(3.75\ in.^2) = 2.98\ in.^2$

$$\phi P_n = \begin{cases} \phi_t F_y A_g = 0.9(36ksi)(3.75in.^2) = 121.5k \\ \phi_t F_u A_e = 0.75(58ksi)(2.98in.^2) = 129.6k \end{cases}$$

Comparison

The reported STAAD.Pro value is based on the term PNT in the STAAD.Pro output..

V. AISC LRFD - Rectangular HSS Compression Strength

To validate that an American ASTM A500 grade B HSS12X10X1/2 compression member has a design compressive strength of over 500 kips.

Reference

Hand calculation using the following reference:

AISC Load Factor Resistance Design, 3rd Edition, Example 4.8, page 4-13 & Table 4-6, Page 4-50.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Problem

F_y = 46 ksi

Length = 20 ft

KY = KZ = 0.8

Comparison

The reported STAAD.Pro value is based on the term PNC in the STAAD.Pro output.

Table 797: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Design strength in Axial Compression (kips)	634 (*)	634.26	none

Note: * In the solved example, on page 4-14, the capacity is reported as ϕ×Pn = 580 kips. Looking at Table 4-6 on page 4-50, this happens to be the capacity for a 20 ft effective length, not a 16 ft effective length. As per the table, the capacity corresponding to a 16 ft effective length is 634 kips.

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC LRFD - Rectangular HSS Compression Strength.STD` is typically installed with the program.

V. AISC LRFD - Wide Flange Flexural Strength 1

To determine the design flexural strength of an ASTM A992 W18X40 bent about its strong axis on a 35-ft span with a uniformly distributed load.

Reference

Hand calculation using the following reference:

AISC Load Factor Resistance Design, 3rd Edition, Example 5.1, Case (a), page 5-12.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Details

The beam is braced such that $L_b = 2\ ft$. The deflection at mid-span due to a uniformly distributed service load of 1 kip/ft is also to be calculated.

$F_y = 50$ ksi

Length = 35 ft

Validation

The beam is continuously braced, so by observation $L_b < L_p$.

The design flexural strength is:

$$\phi_b M_n = \phi_b [F_y Z_x] = 0.9 \times [50 \text{ ksi} \times 78.4 \text{ in}^3] = 3{,}528 \text{ k}\cdot\text{in}$$

The maximum deflection (at midpsan) due to a uniform load of 1 kip/ft is:

$$\Delta = \frac{5w \times l^4}{384EI} = \frac{5(1)(35)^4(12)^3}{384(29{,}000)(612)} = 1.90 \text{ in.}$$

Results

Table 800: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Design flexural strength, $\phi_b M_n$ (in·kips)	3,528	3,528	none	
Deflection (in)	1.90	1.8918	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC LRFD - Wide Flange Flexural Strength 1.STD` is typically installed with the program.

Note: The UNT parameter is set to 1.0 in. in order to approximate a fully-braced condition.

V. AISC LRFD - Wide Flange Flexural Strength 2

To determine the design flexural strength of an ASTM A992 W18X40 bent about its strong axis on a 35-ft span with a uniformly distributed load.

Reference

Hand calculation using the following reference:

AISC Load Factor Resistance Design, 3rd Edition, Example 5.1, Case (b), page 5-12.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Details

The beam is braced at the ends and at third points such that $L_b = 140\ in$.

$F_y = 50$ ksi

Length = 35 ft

Validation

The plastic limiting unbraced length is given by:

$$L_p = 1.76 r_y \sqrt{\frac{E}{F_y}} = 1.76(1.27)\sqrt{\frac{29{,}000}{50}} = 53.8 \text{ in.}$$

The inelastic limiting unbraced length is given by:

$$L_r = \frac{r_y X_1}{F_L}\sqrt{1 + \sqrt{1 + X_2 F_L{}^2}} \qquad \text{(F1-6)}$$

where

F_L = $F_{yf} - F_r = 50\ ksi - 10\ ksi = 40\ ksi$

$$X_1 = \frac{\pi}{S_x}\sqrt{\frac{EGJA}{2}} = \frac{\pi}{68.4}\sqrt{\frac{29,000(11,200)(0.810)(11.85)}{2}} = 1,813$$

$$X_2 = 4\frac{C_w}{I_y}\left(\frac{S_x}{GJ}\right)^2 = 4\left(\frac{1,440}{19.1}\right)\left[\frac{68.4}{11,200(0.810)}\right]^2 = 0.0171$$

$$L_r = \frac{1.27 \times 1,813}{40}\sqrt{1 + \sqrt{1 + 0.0171(40)^2}} = 144.9 \text{ in.}$$

$M_r = F_L S_x = 40 \times 68.4 = 2,736$ in·k (F1-7)

$L_p = 53.8$ in.

$L_r = 144.9$ in.

$L_p < L_b < L_r$; thus, the section is inelastic.

The nominal flexural strength is:

$$M_n = C_b\left[M_p - \left(M_p - M_r\right)\left(\frac{L_b - L_p}{L_r - L_p}\right)\right] < M_p \tag{F1-2}$$

$M_p = F_y Z_x = 50 \times 78.4 = 3,920$ in·k

Conservatively assume $C_b = 1.0$.

$$M_n = 3,920 - \left(3,920 - 2,736\right)\left(\frac{140 - 53.8}{144.9 - 53.8}\right) = 2,800 \text{ in·k}$$

The lateral-torsional buckling limit state capacity:

$\phi_b M_n = 0.9 \times (2,800) = 2,520$ in·k

Results

Table 801: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Design flexural strength, $\phi_b M_n$ (in·kips)	2,520	2,514	negligible

V. AISC LRFD - Wide Flange Flexural Strength 3

To determine the design flexural strength of an ASTM A992 W18X40 bent about its strong axis on a 35-ft span with a uniformly distributed load.

Reference

Hand calculation using the following reference:

AISC Load Factor Resistance Design, 3rd Edition, Example 5.1, Case (c), page 5-12.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Details

The beam is braced at the ends only and so, $L_b = 420\ in$.

F_y = 50 ksi

Length = 35 ft

Validation

The inelastic limiting unbraced length is given by:

$$L_r = \frac{r_y X_1}{F_L}\sqrt{1+\sqrt{1+X_2 F_L{}^2}} \tag{F1-6}$$

where

F_L = F_{yf} - F_r = 50 ksi - 10 ksi = 40 ksi

X_1 = $\frac{\pi}{S_x}\sqrt{\frac{EGJA}{2}} = \frac{\pi}{68.4}\sqrt{\frac{29{,}000(11{,}200)(0.810)(11.85)}{2}} = 1{,}813$

X_2 = $4\frac{C_w}{I_y}\left(\frac{S_x}{GJ}\right)^2 = 4\left(\frac{1{,}440}{19.1}\right)\left[\frac{68.4}{11{,}200(0.810)}\right]^2 = 0.0171$

$$L_r = \frac{1.27 \times 1{,}813}{40}\sqrt{1+\sqrt{1+0.0171(40)^2}} = 144.9 \text{ in.}$$

$L_b > L_r$, thus the section is subject to elastic lateral-torsional buckling.

The modification factor, C_b *is given by:*

$$C_b = \frac{12.5M_{\max}}{2.5M_{\max} + 3M_A + 4M_B + 3M_C} \tag{F1-3}$$

Since the moment diagram is symmetric about the mid-span point of the beam, the maximum moment is the same as the mid-span moment and the quarter-point moments are equal.

$$M_{\max} = M_B = \frac{wl^2}{8}$$

The quarter-point moments of a uniformly loaded beam are likewise equal:

$$M_A = M_C = \frac{w(l/4)}{2}\left(l - \frac{l}{4}\right) = \frac{3wl^2}{32}$$

The wl^2 terms factor out and the constants simply as follows:

$$C_b = \frac{12.5(1/8)}{2.5(1/8) + 3(3/32) + 4(1/8) + 3(3/32)} = \frac{12.5(1/8)}{6.5(1/8) + 6(3/32)} = 1.14$$

The critical buckling moment is given by:

$$M_{cr} = \frac{C_b S_x X_1 \sqrt{2}}{L_b / r_y}\sqrt{1 + \frac{X_1{}^2 X_2}{2(L_b / r_y)^2}} \tag{F1-13}$$

$$M_{cr} = \frac{1.14(68.4)(1{,}813)\sqrt{2}}{420/1.27}\sqrt{1+\frac{(1{,}813)^2(0.0171)}{2(420/1.27)^2}} = 675.6 \text{ in}\cdot\text{k}$$

The lateral-torsional buckling limit state capacity:

$$\phi_b M_n = 0.9 \times (675.6) = 608.1 \text{ in}\cdot\text{k}$$

Results

Table 802: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Modification factor, C_b	1.14	1.14	none	

Result Type	Reference	STAAD.Pro	Difference	Comments
Design flexural strength, $\phi_b M_n$ (in·kips)	608.1	607.2	negligible	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC LRFD - Wide Flange Flexural Strength 3.STD` is typically installed with the program.

The input parameter `CB 0` directs the program to calculate the value of the modification factor.

V. AISC LRFD - Select Wide Flange 1

To select the optimum ASTM A992 W-shape with a design flexural strength of 500 kip-ft.

Reference

AISC Load Factor Resistance Design, 3rd Edition, Table 5.2, , page 5-50.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Problem

Beam is bent about its strong axis, and is continuously braced.

F_y = 50 ksi

Length = 30 ft

w = 4.44 kip/ft (equiv. of 500 ft·kip design moment)

Comparison

Table 803: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Optimum section	W24x55	W24x55	none
Design strength, $\phi_b M_z$ (ft·kips)	506	502.5 (*)	<1%

* Calculated as MZ envelope value divided by the MZ ratio:

499.95 ft·kips/0.995 = 502.5 ft·kips

Note: Fully braced condition can be achieved by setting the UNT parameter equal to 1.0 inch.

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC LRFD - Select Wide Flange 1.STD` is typically installed with the program.

V. AISC LRFD - Non Compact Wide Flange 1

To check the adequacy of a non-compact fully braced W shape to carry a uniformly distributed load of 5.5 kips/ft.

Reference

AISC Load Factor Resistance Design, 3rd Edition, Table 5.4, , page 5-65.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Details

W14x90 shape. Beam is bent about its strong axis.

$F_y = 50$ ksi

Length = 30 ft

Validation

Check flange slenderness:

$$\lambda_p = 0.38\sqrt{E/F_y} = 0.38\sqrt{\tfrac{29{,}000}{50}} = 9.152 < \tfrac{b}{2t_f} = 10.2$$

$$F_L = 50 \text{ ksi} - 10 \text{ ksi} = 40 \text{ ksi}$$

$$\lambda_r = 0.83\sqrt{E/F_L} = 0.83\sqrt{\tfrac{29{,}000}{40}} = 22.35 > \tfrac{b}{2t_f} = 10.2$$

$$M_r = F_L S_x = 40 \times 143 = 5{,}720 \text{ in·k} \qquad \text{(F1-7)}$$

Flanges are non-compact. The nominal moment capacity for the limit state of flange local buckling is:

$$M_n = M_p - \left(M_p - M_r\right)\left(\frac{\lambda - \lambda_p}{\lambda_r - \lambda_p}\right) \qquad \text{(A-F1-3)}$$

$$M_p = F_y Z_x = 50 \times 157 = 7{,}850 \text{ in·k}$$

$$M_n = 7{,}850 - \left(7{,}850 - 5{,}720\right)\left(\tfrac{10.2 - 9.152}{22.35 - 9.152}\right) = 7{,}681 \text{ in·k}$$

Note: As the flanges are fully braced, lateral-torsional buckling does not govern the capacity.

The flange local buckling limit state capacity:

$$\phi_b M_n = 0.9 \times (7{,}681) = 6{,}913 \text{ in·k}$$

The ultimate moment is:

$$M_u = \frac{w_u l^2}{8} = \frac{5.5(30)^2 12}{8} = 7{,}425 \text{ in-k}$$

The capacity ratio is: *7,425 / 6,913 = 1.074*

Results

Table 804: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Design flexural strength, $\phi_b M_n$ (in·kips)	6,913	6,910	negligible	
Capacity ratio	1.074	1.074	none	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC LRFD - Non Compact Wide Flange 1.STD` is typically installed with the program.

Note: The UNT parameter is set to 1.0 in. in order to approximate a fully-braced condition.

V. AISC LRFD - Channel Shape Capacity

To check the adequacy of a fully braced C shape to carry a uniformly distributed ultimate load of 1.5 kips/ft.

Reference

AISC Load Factor Resistance Design, 3rd Edition, Table 5.9, page 5-120.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Details

C12x25 shape. Beam is bent about its strong axis.

F_y = 36 ksi

Length = 20 ft

Validation

The beam is continuously braced, so by observation $L_b < L_p$.

The yielding limit state capacity in bending:

$$\phi_b M_n = \phi_b [F_y Z_x] = 0.9 \times [36 \text{ ksi} \times 29.4 \text{ in}^3] = 952.6 \text{ k·in}$$

The ultimate moment is:

$$M_u = \frac{w_u l^2}{8} = \frac{1.5(12)^2}{8} = 75 \text{ k-ft} = 900 \text{ k-in}$$

The capacity ratio is: $900 / 952.6 = 0.945$

Results

Table 805: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Design flexural strength, $\phi_b M_n$ (in·kips)	952.6	952.6	none	
Capacity ratio	0.945	0.945	none	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC LRFD - Channel Shape Capacity.STD` is typically installed with the program.

Note: The UNT parameter is set to 1.0 in. in order to approximate a fully-braced condition.

V. AISC LRFD - MC Shape Capacity

To check the adequacy of a fully braced MC shape to carry a uniformly distributed ultimate load of 1.34 kips/ft.

Reference

AISC Load Factor Resistance Design, 3rd Edition, Table 5.10, page 5-124.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Details

MC10x41.1 shape. Beam is bent about its strong axis.

$F_y = 36$ ksi

Length = 25 ft

Validation

The beam is continuously braced, so by observation $L_b < L_p$.

The yielding limit state capacity in bending:

$$\phi_b M_n = \phi_b[F_y Z_x] = 0.90\times[36 \text{ ksi} \times 39.3 \text{ in}^3] = 1{,}273 \text{ k}\cdot\text{in}$$

The ultimate moment is:

$$M_u = \frac{w_u l^2}{8} = \frac{1.34(25)^2 12}{8} = 1{,}256 \text{ k-in}$$

The capacity ratio is: *1,256 / 1,273 = 0.987*

Results

V. AISC LRFD - Non Compact Wide Flange 2

To determine the design bending strength of a non-compact American wide flange section bent about its strong axis. The deflection at mid-span due to two 10 kip concentrated loads acting at the third points along the beam is also to be calculated.

Reference

AISC Load Factor Resistance Design, 3rd Edition, Example 5.2, case (a), page 5-16.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Details

W21x48 shape

$F_y = 50$ ksi

Length = 40 ft

$L_b = 60$ in.

Validation

Evaluate section for lateral-torsional buckling:

The plastic limiting unbraced length is given by:

$$L_p = 1.76 r_y \sqrt{\frac{E}{F_y}} = 1.76(1.66)\sqrt{\frac{29{,}000}{50}} = 70.4 \text{ in.}$$

$L_b < L_p$; thus, the member is plastic.

Check flange slenderness:

$$\lambda_p = 0.38\sqrt{E / F_y} = 0.38\sqrt{\frac{29{,}000}{50}} = 9.152 < \frac{b}{2t_f} = 9.47$$

$F_L = 50$ ksi - 10 ksi = 40 ksi

$$\lambda_r = 0.83\sqrt{E/F_L} = 0.83\sqrt{\frac{29{,}000}{40}} = 22.35 > \frac{b}{2t_f} = 9.47$$

$$M_r = F_L S_x = 40 \times 93.0 = 3{,}720 \text{ in}\cdot\text{k} \quad \text{(F1-7)}$$

Flanges are non-compact. The nominal moment capacity for the limit state of flange local buckling is:

$$M_n = M_p - \left(M_p - M_r\right)\left(\frac{\lambda - \lambda_p}{\lambda_r - \lambda_p}\right) \quad \text{(A-F1-3)}$$

$$M_p = F_y Z_x = 50 \times 107 = 5{,}350 \text{ in}\cdot\text{k}$$

$$M_n = 5{,}350 - \left(5{,}350 - 3{,}720\right)\left(\frac{9.47 - 9.152}{22.35 - 9.152}\right) = 5{,}311 \text{ in}\cdot\text{k}$$

The flange local buckling limit state capacity:

$$\phi_b M_n = 0.9 \times (5{,}311) = 4{,}780 \text{ in}\cdot\text{k}$$

The ultimate moment is:

$$M_u = P_u\left(l/3\right) = 10\left(\frac{30 \times 12}{3}\right) = 1{,}600 \text{ in-k}$$

The capacity ratio is: *1,600 / 4,780 = 0.335*

The deflection at mid-span for a beam loaded at third points:

$$\Delta_{\max} = \frac{Pl^3}{28EI} = \frac{10 \times (40 \times 12)^3}{28 \times 29{,}000 \times 959} = 1.42 \text{ in.}$$

Results

Table 807: Comparison of results

V. AISC LRFD - Non Compact Wide Flange 3

To determine the design bending strength of a non-compact American wide flange section bent about its strong axis.

Reference

AISC Load Factor Resistance Design, 3rd Edition, Example 5.2, case (b), page 5-16.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Problem

W21x48 shape

$F_y = 50$ ksi

Length = 40 ft

$L_b = 160$ in.

Validation

The plastic limiting unbraced length is given by:

$$L_p = 1.76 r_y \sqrt{\frac{E}{F_y}} = 1.76\left(1.66\right)\sqrt{\frac{29{,}000}{50}} = 70.4 \text{ in.}$$

The inelastic limiting unbraced length is given by:

$$L_r = \frac{r_y X_1}{F_L}\sqrt{1+\sqrt{1+X_2 F_L^{\ 2}}} \tag{F1-6}$$

where

F_L = $F_{yf} - F_r = 50\ ksi - 10\ ksi = 40\ ksi$

X_1 = $\frac{\pi}{S_x}\sqrt{\frac{EGJA}{2}} = \frac{\pi}{93.0}\sqrt{\frac{29{,}000(11{,}200)(0.803)(14.1)}{2}} = 1{,}449$

X_2 = $4\frac{C_w}{I_y}\left(\frac{S_x}{GJ}\right)^2 = 4\left(\frac{3{,}950}{38.7}\right)\left[\frac{93.0}{11{,}200(0.803)}\right]^2 = 0.0437$

$$L_r = \frac{1.66 \times 1{,}449}{40}\sqrt{1+\sqrt{1+0.0437(40)^2}} = 184.6 \text{ in.}$$

$L_p < L_b < L_r$; thus, the section is inelastic.

The nominal flexural strength is:

$$M_n = C_b\left[M_p - \left(M_p - M_r\right)\left(\frac{L_b - L_p}{L_r - L_p}\right)\right] < M_p \tag{F1-2}$$

$$M_r = F_L S_x = 40 \times 93.0 = 3{,}720 \text{ in}\cdot\text{k} \tag{F1-7}$$

$$M_p = F_y Z_x = 50 \times 107 = 5{,}350 \text{ in}\cdot\text{k}$$

Conservatively assume $C_b = 1.0$ (this is the default behavior in STAAD.Pro when the parameter is not directly specified).

$$M_n = 5{,}350 - \left(5{,}350 - 3{,}720\right)\left(\frac{160 - 70.4}{184.6 - 70.4}\right) = 4{,}071 \text{ in}\cdot\text{k}$$

The lateral-torsional buckling limit state capacity:

$$\phi_b M_n = 0.9\times(4{,}071) = 3{,}664 \text{ in}\cdot\text{k}$$

Comparison

The reported STAAD.Pro value is based on the term `MNZ` in the STAAD.Pro output.

Table 808: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Design flexural strength, $\phi_b M_n$ (in·kips)	3,664	3,658.52	negligible	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC LRFD - Non Compact Wide Flange 3.STD` is typically installed with the program.

V. AISC LRFD - Wide Flange Compression Capacity 4

To determine the design bending strength of a non-compact American wide flange section bent about its strong axis.

Reference

AISC Load Factor Resistance Design, 3rd Edition, Example 5.2, case (c), page 5-16.

Details

W21x48 shape

$F_y = 50$ ksi

Length = 40 ft

$L_b = 480$ in. (braced at end points only)

Validation

The inelastic limiting unbraced length is given by:

$$L_r = \frac{r_y X_1}{F_L}\sqrt{1 + \sqrt{1 + X_2 F_L{}^2}} \qquad \text{(F1-6)}$$

where

$$F_L = F_{yf} - F_r = 50 \text{ ksi} - 10 \text{ ksi} = 40 \text{ ksi}$$

$$X_1 = \frac{\pi}{S_x}\sqrt{\frac{EGJA}{2}} = \frac{\pi}{93.0}\sqrt{\frac{29{,}000(11{,}200)(0.803)(14.1)}{2}} = 1{,}449$$

$$X_2 = 4\frac{C_w}{I_y}\left(\frac{S_x}{GJ}\right)^2 = 4\left(\frac{3{,}950}{38.7}\right)\left[\frac{93.0}{11{,}200(0.803)}\right]^2 = 0.0437$$

$$L_r = \frac{1.66 \times 1{,}449}{40}\sqrt{1 + \sqrt{1 + 0.0437(40)^2}} = 184.6 \text{ in.}$$

$L_b > L_r$, thus the section is subject to elastic lateral-torsional buckling.

The modification factor, C_b *is given by:*

$$C_b = \frac{12.5M_{\max}}{2.5M_{\max} + 3M_A + 4M_B + 3M_C} \qquad \text{(F1-3)}$$

Since the moment diagram is symmetric about the mid-span point of the beam, the maximum moment is the same as the mid-span moment and the quarter-point moments are equal.

$$M_{\max} = M_B = \frac{wl^2}{8}$$

The quarter-point moments of a uniformly loaded beam are likewise equal:

$$M_A = M_C = \frac{w(l/4)}{2}\left(l - \frac{l}{4}\right) = \frac{3wl^2}{32}$$

The wl^2 terms factor out and the constants simply as follows:

$$C_b = \frac{12.5(1/8)}{2.5(1/8) + 3(3/32) + 4(1/8) + 3(3/32)} = \frac{12.5(1/8)}{6.5(1/8) + 6(3/32)} = 1.14$$

The critical buckling moment is given by:

$$M_{cr} = \frac{C_b S_x X_1 \sqrt{2}}{L_b / r_y} \sqrt{1 + \frac{{X_1}^2 X_2}{2(L_b / r_y)^2}} \quad \text{(F1-13)}$$

$$M_{cr} = \frac{1.14(93.0)(1{,}449)\sqrt{2}}{480 / 1.66} \sqrt{1 + \frac{(1{,}449)^2(0.0437)}{2(480 / 1.66)^2}} = 935.0 \text{ in·k}$$

The lateral-torsional buckling limit state capacity:

$$\phi_b M_n = 0.9 \times (935.0) = 841.5 \text{ in·k}$$

Results

Table 809: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Modification factor, C_b	1.14	1.14	none	
Design flexural strength, $\phi_b M_n$ (in·kips)	841.5	834.4	<1%

V. AISC LRFD - Select Wide Flange 2

To find the optimum W shape with a flexural design strength of 150 ft·kips. Beam is braced at ends and at mid-span point.

Reference

AISC. *Load and Resistance Factor Design Specification*, 3rd Edition. 1999. Example 5.4, page 5-21.

AISC. *Manual of Steel Construction*, 3rd Edition. 1999.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Details

The beam should also satisfy a deflection limit of 1.0 inches under service load.

F_y = 50 ksi

Length = 20 ft

L_b = 10 ft

Service load of 2.0 kip/ft. Deflection limit under service load = 1.0 in.

Validation

From the chart on p.4-160 of the *Manual of Steel Construction*, the most efficient wide-flange section to resist 150 kip-ft of moment with an unbraced length of 10 ft is a W16x31. From this same chart, the design bending strength can be taken as 150 kip-ft (the curve crosses at approximately the same point as the demand load).

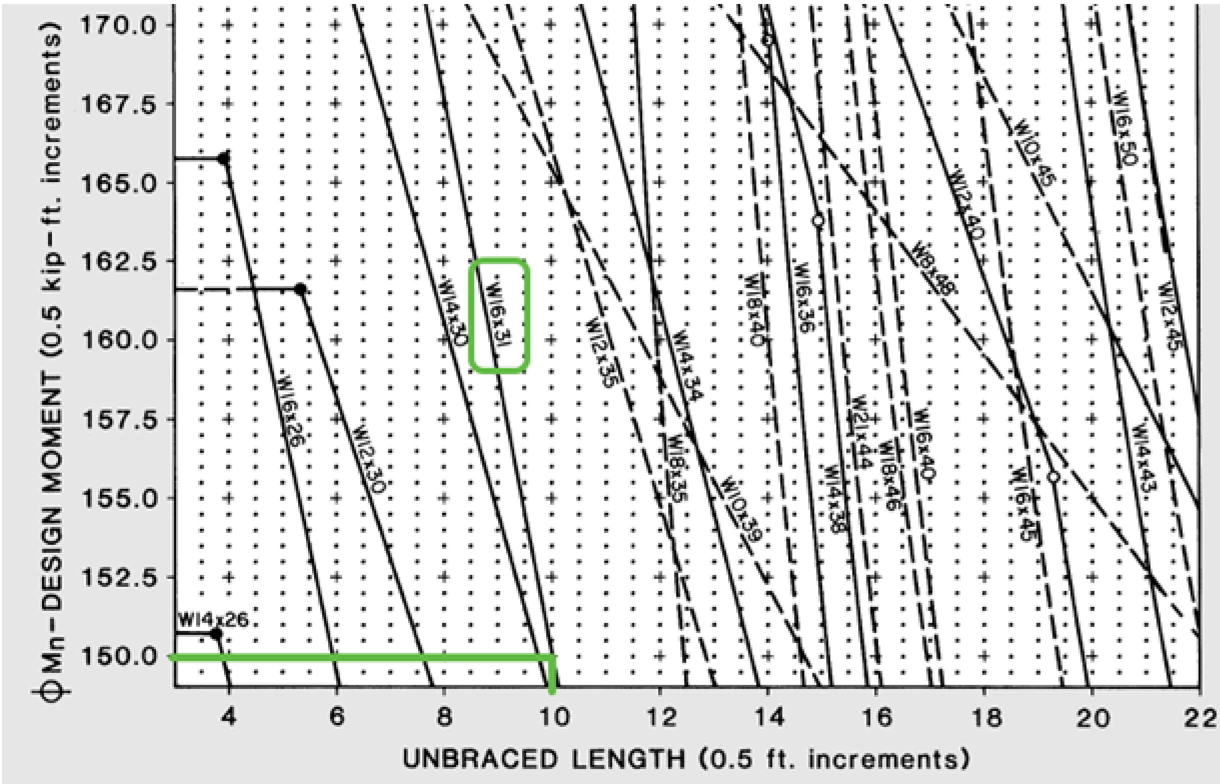

Figure 503: Design flexural strength of beams with unbraced length greater than L_p

The deflection limit under service conditions can be met by determining the minimum required moment of inertia needed.

$$1 \text{ in.} = \frac{5(2.0 \text{ k/ft})(20 \text{ ft})^4(12 \text{ in/ft})^3}{384(29,\ 000 \text{ ksi})I}$$

Solving for the minimum $I = 248\ in^4$. A W16x31 has an $I_x = 375\ in^4$, so it will have less deflection than the limit under service conditions.

Results

Table 810: Comparison of results

Result Type	Theory	STAAD.Pro	Difference	Comments
Optimum Section	W16x31	W16x31	none	
Design bending strength, $\phi_b M_n$ (in·kips)	1,800 (150 ft·kips)	1,801.66	negligible	

Result Type	Theory	STAAD.Pro	Difference	Comments
Maximum permissible deflection (in)	1.0	0.6584	N/A	The STAAD.Pro reported maximum deflection is less than 1.0 in; therefore this section satisfies the requirement. However, this value is not to be directly compared with the limit itself.

V. AISC LRFD - Load Capacity of 3 Wide Flange Beams

To find the design flexural strength capacity of 3 beams of different spans using the data in Table 5-4 of AISC LRFD 3rd edition.

Reference

AISC Load Factor Resistance Design, 3rd Edition, Example 5.5, page 5-21.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Details

W21x62 section.

$$F_y = 50 \text{ ksi}$$

40 ft, 30 ft, and 8 ft spans are investigated. All beams are fully braced.

Validation

Bending Capacity

The beam is fully braced so it can reach full plastic capacity:

$$\phi M_n = 0.9 \times 50 \times 144 = 6{,}480 \text{ in-k}$$

The total load capacity on the beam is then calculated by setting the ultimate capacity equal to the load, $\phi M_n = M_u = W \times l\ /\ 8$ and then solving for the total load:

$$W_1 = 8\left(\phi M_n / l\right) = 8\left(\frac{6{,}480}{40 \times 12}\right) = 108 \text{ kips}$$

$$W_2 = 8\left(\phi M_n / l\right) = 8\left(\frac{6{,}480}{30 \times 12}\right) = 144 \text{ kips}$$

Shear Capacity

Check for web slenderness:

$$\frac{h}{t_w} = 46.9 < 2.45\sqrt{E / F_{yw}} = 2.45\sqrt{29{,}000 / 50} = 59.0$$

The nominal shear capacity of a W21x62 section:

$$V_n = 0.6F_{yw}A_w = 0.6 \times 50 \times 0.4 \times 21.0 = 252 \text{ kips}$$

$$\phi V_n = 0.9 \times 252 = 226.8 \text{ kips}$$

The total load capacity on the beam is then calculated by setting the ultimate capacity equal to the load, $\phi V_n = V_u = W\ /\ 2$ and then solving for the total load:

$$W_3 = 2\left(\phi V_n\right) = 2\left(226.8\right) = 453.6 \text{ kips}$$

This governs the total load capacity for the short span (8') case.

Using the total weight values from the reference, the following distributed loads are calculated:

Member	W (kips)	l (ft)	w (kips/ft)
1	108	40	2.7
2	144	30	4.8
3	454	8	56.75

Results

There is no direct comparison of the results from STAAD.Pro with the Reference, as the program does not directly compute the total member load. However, when the total member load is applied as a distributed load (see previous table), the Utilization ratio will then nominally be unity (1.0) for a beam loaded at its capacity.

Table 811: Comparison of results

Result Type		Reference	STAAD.Pro	Difference	Comments
Beam #1: 30 ft span	Bending capacity, ϕM_n (in·k)	6,480	6,480	none	
	Utilization ratio	1.0	1.0	none	
Beam #2: 20 ft span	Bending capacity, ϕM_n (in·k)	6,480	6,480	none	
	Utilization ratio	1.0	1.0	none

Problem

W10x22 section.

$F_y = 50$ ksi

$F_u = 65$ ksi

$P_u = 55$ kips

$M_{uy} = 0$, $M_{uz} = 55$ ft·kips

$L_b = 4$ ft

Comparison

The reported STAAD.Pro value is based on the terms PNT and MNZ in the STAAD.Pro output.

Table 812: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Design tensile strength, $\phi_t P_n$ (kips)	292.0	292	none
Design bending strength, $\phi_b M_{ny}$ (ft·kips)	97.5	97.5 (1,170 in·kips)	none
Utilization ratio	0.98	0.98	none

Note: Fully braced condition can be achieved by setting the UNT parameter equal to 1.0 inch.

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC LRFD - Tension and Strong Axis Bending.STD` is typically installed with the program.

V. AISC LRFD - Compression and Biaxial Bending

To check the adequacy of an ASTM A992 W14X176 beam subject to axial compression and biaxial bending.

Reference

AISC Load Factor Resistance Design, 3rd Edition, Example 6.2, page 6-6.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Problem

W14x176 section.

$F_y = 50$ ksi

$P_u = 1{,}400$ kips

$M_{uy} = 70$ ft ·kips, $M_{uz} = 200$ ft ·kips

$L_b = 14$ ft

Reverse curvature bending with equal end moments for both axis.

Hand Calculations

According to page 16.1 - 97 of the LRFD 3rd ed. code,

$$M_p = F_y \cdot Z \leq 1.5F_y \cdot S$$

For a W14x176,

$$0.9\ (1.5F_y \cdot S) = 0.9\ [1.5\ (50)(107)] = 7{,}222 \text{ kip-in} = 601.8 \text{ kip-ft},$$

which is lower than $(0.9\ Fy\ .\ Z) = 611$. Hence, STAAD.Pro uses this limit state.

Comparison

The reported STAAD.Pro value is based on the terms `PNC`, `MNY`, and `MNZ` in the STAAD.Pro output.

Table 813: Comparison of results

Result Type	Theory	STAAD.Pro	Difference
Design compressive strength, $\phi_c P_n$ (kips)	1,940	1,938	negligible
Design bending strength, $\phi_b M_{ny}$ (ft·kips)	611	600.5 (7,206 in·kips)	1.7%
Design bending strength, $\phi_b M_{nz}$ (ft·kips)	1,200	1,200 (14,400 in·kips)	none
Utilization ratio	0.973	0.974	negligible

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISC\AISC LRFD - Compression and Biaxial Bending.STD` is typically installed with the program.

V. AISC LRFD - Select Compression and Biaxial Bending

To select the lightest ASTM A992 W14 section capable of carrying an axial compression plus biaxial bending.

Reference

AISC Load Factor Resistance Design, 3rd Edition, Example 6.4, page 6-9.

Related Links

- *D1.C.5 Limit States* (on page 1165)

Problem

F_y = 50 ksi

P_u = 400 kips

M_{uy} = 80 ft·kips, M_{uz} = 250 ft·kips

L_b = 14 ft

Reverse curvature bending with equal end moments for both axis.

V. AISC N690 1994 Angle

Verify the allowable stress and critical ratio of the brace members in a frame using the AISC N690 1994 code.

Details

The horizontal load is 7.5 kips and the vertical load is 10 kips.

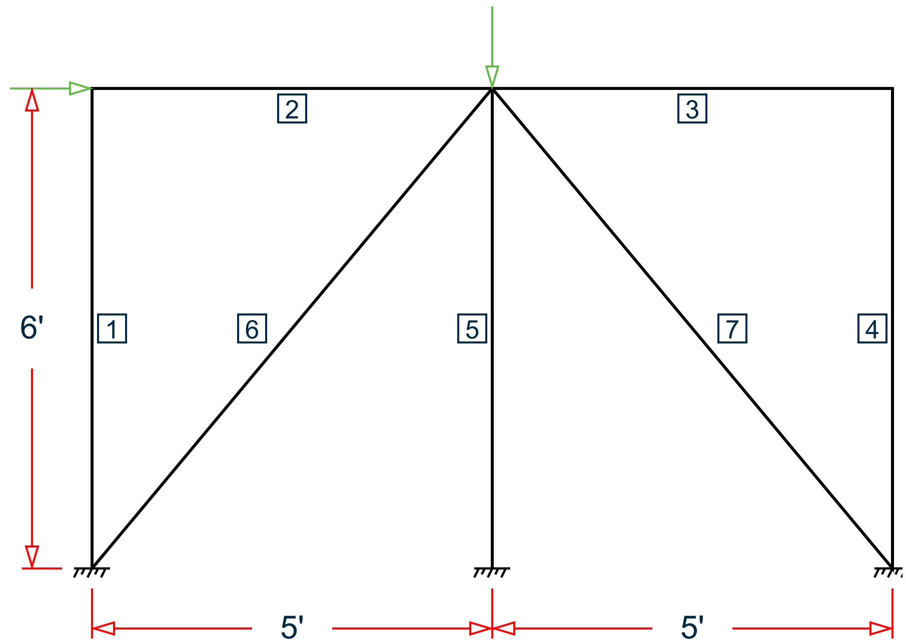

Figure 504: Space frame subjected to static loads

The forces due to loading in member 6 is 2.861 kips (tension) and in member 7 is 7.328 kips (compression). Members 6 and 7 are "truss" members (axial-only).

Both member 6 and 7 are L 80x60x10, austenitic stainless steel ($F_y = 36\ ksi$, $F_u = 58\ ksi$).

Assume a net section factor of 0.9 and an effective length factor of 0.85.

Validation

$$L = \sqrt{5^2 + 6^2}(12\text{in/ft}) = 93.726\text{in}$$

Slenderness ratio (same for both members) using the minimum value of r: $kL/r_z = 0.85(93.726)/1.29 = 61.76$

For member 6, $kL/r_z = 61.76 < 300$

For member 7, $kL/r_z = 61.76 < 200$

For members in compression (member 7), the equivalent slenderness ratio per Eqn. 4-4 of AISC ASD p5-311 must also be determined:

$$(KL/r)_{equiv} = \pi\times\sqrt{(E/F_e)}$$

where

F_e = the elastic buckling strength for flexural torsional buckling taken to be 60.348 ksi. This is defined as the lowest root of the Eqn in AISC ASD (C4-2) page 5-317

Thus, $(KL/r)_{equiv} = \pi\times\sqrt{(29{,}000/60.348)} = 68.86$

<u>Axial Tension: Member 6</u>

Actual tensile stress (gross) = $P/A = 2.862 / 8.41 = 0.340$ ksi

Allowable tensile stress (Tension capacity) = $0.6 \times F_y = 0.6 \times 36 = 21.6$ ksi

Critical ratio = 0.340/21.6 = 0.016

<u>Axial Compression: Member 7</u>

Actual compressive stress = $P/A = 7.328 / 8.41 = 0.871$ ksi

As this member is made from austenitic stainless steel the allowable compression stress should be determined according to clause Q.1.5.9. As $KL/r < 120$, then the value of allowable axial stress, F_a, is determined from Eqn. Q1.5-11:

$$Fa = \frac{Fy}{2.15} - \left(\frac{\frac{Fy}{2.15} - 6}{120} \right) \times Kl \Big/ r = 16.74 - \left(\frac{16.71 - 6}{120} \right) 68.86 = 10.57 \text{ ksi}$$

Check cross-section meets requirements of Q1.9, which sets a limit for any unstiffened element clause Q1.9.1.2 of $75/\sqrt{(F_y)} = 12.67$

Short leg = $B/t = 6/0.625 = 9.5 < 12.67$, OK
Long leg = $D/t = 8/0.625 = 12.8 > 12.67$, leg is slender

Since $75/\sqrt{(F_y)} = 12.67 < D/t = 12.8 < 155/\sqrt{(F_y)} = 25.83$, Q_s is determined by Eqn. QC2-1:

$$Q_s = 1.340 - 0.00447 \times (b/t) \times \sqrt{(F_y)} = 0.9967$$

Allowable compressive stress, $F_a = 0.9967 \times 10.57 = 10.54$ ksi

Critical ratio = $0.871 / 10.54 = 0.083$

Results

Table 815: Verification comparison for AISC_N690_1994_Angle

Parameter		Hand Calculation	STAAD.Pro	Difference	Comments
Member 6 (tension)	Slenderness ratio	61.76	61.76	negligible	
	Actual tensile stress (ksi)	340	340	none	
	Allowable tensile stress (ksi)	21.6	21.6	none	
	Critical ratio	0.016	0.016	none	
Member 7 (compression)	Critical slenderness ratio	68.86	68.87	negligible	
	Actual tensile stress (ksi)	0.871	0.87	negligible	

Parameter		Hand Calculation	STAAD.Pro	Difference	Comments
	Allowable compressive stress (ksi)	10.54	10.55	negligible	
	Critical ratio	0.083	0.083	none

V. AISC N690 1994 Channel

Verify the design of channel section used for a beam member using the AISC N690 1994 code.

Details

The beam is a propped cantilever 80 inches long. The beam is loaded with a 2 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is C15x50 channel section with Grade A36 steel.

Validation

Maximum shear force (at fixed end): V = 51.375 kips (taken from STAAD.Pro analysis)

Maximum moment (at fixed end): M = 830.0 in-kip (taken from STAAD.Pro analysis)

Slenderness Ratio

About z-axis: $(KL/r)_z = 0.85(80\ in)/(5.25\ in) = 12.95$

About y-axis: $(KL/r)_y = 0.85(80\ in)/(0.865\ in) = 78.61$

Max. slenderness ratio < 300, OK.

Bending About Major Axis (Z Axis)

$$\frac{b_f}{t_f} = 4.62 < \frac{65}{\sqrt{F_y}} = 10.83$$

The laterally unsupported length of the compression flange, $L_b = 80 < \frac{76 b_f}{\sqrt{F_y}} = 120$

and $< \frac{20,000}{(d / A_f) F_y} = 89.56$

As b_f/t_f is not in the range of $65/\sqrt{(Fy)}$ and $95/\sqrt{(Fy)}$, the value of allowable bending compressive and tensile stress = $F_{bty} = F_{bcy} = 0.6 \times F_y = 21.6\ ksi$

Actual bending stress:

Bending Tensile Stress = bending compressive stress = $f_{btz} = f_{bcz} = MzD\ /\ (2I_z) = 15.4\ ksi$

$$830.0\ (15.0) / (2 \times 404) = 15.41\ \text{ksi}$$

Critical ratio = 15.41 ksi / 21.6 ksi = 0.713

<u>Shear</u>

Actual shear:

$$F_y = 51.375 \text{ kips}$$

STAAD.Pro calculates the shear are based on the general shear stress equation, $\tau = V \times Q/(I \times t)$ from Timoshenko. Thus the shear area, $A_y = I \times t/Q = 8.47\ in^2$

$$f_v = 51.375 / 8.47 = 6.07 \text{ ksi}$$

Allowable shear:

a = clear distance between transverse stiffeners (here taken as length) = 80 in

h = clear distance flanges of the girder = $D\text{-}2t_f = 14.35\ in$

Thus, $a/h = 5.57$, Therefore, $k = 5.34 + [4.00/\ (a/h)^2] = 5.46$

$$t = t_w = 0.72 \text{ in}$$

If

$$Cv = 17.2$$

$$F_v = \min \begin{vmatrix} F_y/2.89 \times C_v = 25.6\ ksi \\ 0.4 \times F_y = 14.4\ ksi \end{vmatrix}$$

Hence allowable=14.4 ksi

Therefore, Ratio = $f_v/F_v = 6.07\ /\ 14.4 = 0.422$

Results

Table 816: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Slenderness ratio	78.61	78.61	none	
Allowable bending stress (ksi)	21.6	21.6	none	
Actual bending stress (ksi)	15.41	15.41	none	
Critical ratio	0.713	0.713	none	
Allowable shear stress (ksi)	14.4	14.4	none	
Actual shear stress (ksi)	6.07	6.06	negligible

V. AISC N690 1994 Pipe Section With SLC

Verify the design of a pipe section used for a beam member per the AISC N690 1994 code.

References

Gere, J. M. and S. P. Timoshenko. 1984. *Mechanics of Materials, 2nd Edition*. Boston, MA: PWS Publishers. p.238.

Details

The 10 ft long span is a propped cantilever which is free to move axially at the fixed end. The beam is subject to the following four different load cases:

1. a 10 kip axial tension force,
2. a 10 kip axial compression force,
3. a uniformly distributed load of 0.3 kip/ft in the Global Y directions, the member selfweight (acts in Global Y), and the tension load from case 1
4. a uniformly distributed load of 0.3 kip/ft in the Global Y directions, the member selfweight (acts in Global Y), and the compression load from case 2

The member is Pipe 5-Sched. 40 (standard) pipe section with Grade A36 steel. The self-weight is 14.6 lbs/ft.

Validation

<u>Slenderness Ratio</u>

The slenderness ratio is the same about either local z or y axes: $KL/r = 120\ in\ /\ 1.888\ in = 63.56 < 300$, OK

<u>Axial Tension</u>

From section Q1.5.1.1, the allowable tensile stress:

$$F_t = \min \left| \begin{array}{l} 0.6F_y = 0.6 \times 36 = 21.6 \text{ ksi} \\ 0.5F_u = 0.5 \times 58 = 29 \text{ ksi} \end{array} \right.$$

The actual tensile stress from load case 1:

$$f_t = \frac{P}{A} = \frac{10}{4.01} = 2.49 \text{ ksi} < F_t$$

Stress ratio = $2.49\ /\ 21.6 = 0.115$, hence OK.

<u>Axial Compression</u>

Allowable compressive stress per Cl Q1.9.2.3:

$$\frac{\mathrm{OD}}{t} = \frac{5.56}{0.24} = 23.17 < \frac{3{,}300}{F_y} = \frac{3{,}300}{36} = 91.67$$

$$C_c = \sqrt{\frac{2\pi^2 E}{F_y}} = 126.1$$

Since $Kl/r < C_c$, per eq. Q1.5-1, the allowable axial compressive stress:

$$F_a = \frac{1 - \frac{\left(kl/r\right)^2}{2 \times C_c^2}}{\frac{5}{3} + 3 \times \frac{kl/r}{8 \times C_c} - \frac{\left(kl/r\right)^3}{8 \times C_c^3}} F_y = 17.08 \text{ ksi}$$

The actual compressive stress from load case 2:

$$f_a = \frac{P}{A} = \frac{10}{4.01} = 2.49 \text{ ksi} < F_a$$

Stress ratio = $2.49 / 17.08 = 0.146$, hence OK.

Bending

Section is compact per Cl Q1.5.1.4.1: $\frac{OD}{t} = 23.17 < \frac{3{,}300}{F_y} = 91.67$

Allowable bending stress about both axes: $F_b = 0.66 \times F_y = 23.76$ ksi

Moment due to load case 3 or 4 on a propped cantilever (ref. AISC Steel Construction Manual):

$$M_z = \frac{w \times l^2}{8} = \frac{0.314 \times 10^2}{8} = 3.93 \text{ ft·k} = 47.2 \text{ in·k}$$

Actual bending stress about the major axis: $f_{bz} = \frac{M_z}{I_z}\left(\frac{OD}{2}\right) = \frac{47.2}{14.3}\left(\frac{5.56}{2}\right) = 9.17$ ksi

(actual bending about the minor axis: $f_{by} = 0$)

Stress ratio: $9.17 / 23.76 = 0.386$, hence OK.

Combined Bending and Axial Tension

Interaction per Cl Q1.6.2 in load case 3 (tension + bending):

$$\frac{f_a}{\texttt{SFT} \times 0.6F_y} + \frac{f_{bz}}{\texttt{SMZ} \times F_{bz}} = \frac{2.49}{1.3 \times 21.6} + \frac{9.17}{1.4 \times 23.76} = 0.364 \qquad \text{(Eq. Q1.6-1b)}$$

Combined Bending and Axial Compression

Interaction per Cl Q1.6 in load case 4 (compression + bending):

$$\frac{f_a}{F_a} = 0.145 < 0.15 \qquad \text{(Eq. Q1.6-2)}$$

$$\frac{f_a}{\texttt{SFC} \times F_a} + \frac{f_{by}}{\texttt{SMY} \times F_{by}} + \frac{f_{bz}}{\texttt{SMZ} \times F_{bz}} = \frac{2.49}{1.3 \times 17.08} + \frac{0}{1.4 \times 23.76} + \frac{9.17}{1.4 \times 23.76} = 0.388$$

Shear

Actual shear (at supports):

$$f_{v,y} = \frac{5w \times l}{8} = \frac{5 \times 0.315 \times 10}{8} = 1.97 \text{ kip}$$

Shear area (calculated as per Gere & Timoshenko reference):

$$A_z = \frac{\frac{\pi}{4}\left(r_2{}^4 - r_1{}^4\right) \times 2\left(r_2 - r_1\right)}{\frac{2}{3}\left(r_2{}^3 - r_2{}^3\right)}$$

where

r_1	=	the inner radius of the pipe = $5.56\ /\ 2 - 0.24 = 2.54\ in$
r_2	=	the outer radius of the pipe = $5.56\ /\ 2 = 2.78\ in$

Thus, the shear area along both axes = $2.008\ in^2$.

$$F_{vy} = \frac{F_{v,y}}{A_y} = \frac{1.97}{2.008} = 0.98 \text{ ksi}$$

(shear stress in major axis = 0)

The allowable shear stress:

$$F_v = 0.4F_y = 14.4 \text{ ksi}$$

Stress ratio in Y (minor axis): $0.98/14.4 = 0.068$, hence OK.

Results

Table 817: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Slenderness ratio	63.56	63.55	negligible	
Actual axial tensile stress (ksi)	2.49	2.49	none	
Allowable axial tensile stress (ksi)	21.6	21.6	none

```

V. AISC N690 1994 Pipe

Verify the design of a pipe section used for a beam member per the AISC N690 1994 code.

Details

The simply supported beam is 50 inches long. The beam is loaded with a 1.5 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is PIPS 120 pipe section with Grade A36 steel.

Validation

Maximum shear force, $V = \frac{P}{2} + \frac{wL}{2} = \frac{1.5}{2} + \frac{1.0(50)}{2} = 25.75kips$

Maximum moment, $M = \frac{PL}{4} + \frac{wL^2}{8} = \frac{1.5(50)}{4} + \frac{1.0(50)^2}{8} = 331.25in \cdot kip$

Slenderness ratio = (KL/r) = 9.72 < 300

<u>Bending About Major Axis (Z-Axis)</u>

Section is compact: $\frac{OD}{t} = 36.43 < \frac{3,\ 300}{F_y} = 91.67$

Allowable bending stress: $F_b = 0.66 \times F_y = 23.76\ ksi$

Actual bending stress: $f_{btz} = f_{bcz} = \frac{M_z}{I_z}\left(\frac{OD}{2}\right) = \frac{331.25}{262}\left(\frac{12.75}{2}\right) = 8.06ksi$

Stress ratio: 0.339

<u>Shear</u>

From the reference, the shear area:

$$A_y = \frac{0.25\pi\left(r_2{}^4 - r_1{}^4\right)2\left(r_2 - r_1\right)}{\frac{2}{3}\left(r_2{}^3 - r_1{}^3\right)}$$

where

r_1	=	inner radius
r_2	=	outer radius

Shear area: $A_y = 6.8\ in^2$

Actual shear stress (at supports): $f_v = 25.75\ /\ 6.8 = 3.78\ ksi$

Actual shear stress (at midspan): $f_v = 0.75\ /\ 6.8 = 0.110\ ksi$

Allowable shear stress, $F_v = 0.4 \times F_y = 14.4\ ksi$

Stress ratio: 3.78/14.4 = 0.263

Results

Table 818: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Slenderness ratio	9.72	9.72	none	
Allowable bending stress (ksi)	23.76	23.76	none	
Actual bending stress (ksi)	8.06	8.06	none	
Critical stress ratio	0.339	0.339	none	
Allowable shear stress (ksi)	14.4	14.4	none

- *D1.K.1. ANSI/AISC N690-1994 Code* (on page 1296)

V. AISC N690 1994 W Shaped

Verify the design of a wide-flange section used for a cantilever beam using the AISC N690 1994 code.

Details

The beam is a 10 ft cantilever with a 12.5 kip concentrated load at the free end.

The member is a W16X40 section with Grade A36 steel.

Validation

Maximum shear force (constant shear): $V = 12.5\ kips$

Maximum moment (at fixed end): $M = 12.5\ kips \times 120\ in = 1{,}500\ in{\cdot}kips$

<u>Slenderness Ratio</u>

$(KL/r)_z$ = Slenderness Ratio along Z-Axis = 18.11

$(KL/r)_y$ = Slenderness Ratio along Y-Axis = 76.68

Maximum Slenderness Ratio = 76.68 < 240 (Hence OK)

<u>Bending</u>

Allowable Bending Stress About Major Axis (Z Axis)

$$b_f/2t_f = 6.862 < 65/\sqrt{(F_y)}$$

Thus, allowable bending tensile stress = $F_{btz} = 0.66 \times F_y = 23.76\ ksi$

Actual bending stress About Major Axis

$f_{btz} = M_z D / 2 \times I_z = 23.2$ ksi

Stress ratio = 23.2 ksi / 23.76 kis = 0.975

<u>Shear</u>

Allowable Shear Stress

a = clear distance between transverse stiffeners (here taken as length) = *120 inch*

h = clear distance flanges of the girder = $D\text{-}2t_f = 14.91$ *inch*

Thus, $a/h = 8.05$, Therefore, $k = 5.34 + [4.00/\ (a/h)^2] = 5.36$

$t = t_w = 0.3$ inch

Cv =1.475

$F_v = (Fy/2.89)Cv \geq 0.4 \times F_y = 14.4$ *ksi* Hence allowable=14.4ksi

Actual Shear Stress

STAAD.Pro calculates the shear are based on the general shear stress equation, $\tau = V \times Q/(I \times t)$ from Timoshenko. Thus the shear area, $A_y = I \times t/Q = 4.401\ in^2$

$f_v = F_y/A_y = 12.5$ kip / 4.401 = 2.84 ksi

Stress ratio = $f_v/F_v = 0.18$

Results

V. AISC N690 1984 Angle

Verify the allowable stress and critical ratio of the brace members in a frame using the AISC N690 1984 code.

Details

The forces due to loading in member 6 is 2,666.18 lbs (tension) and in member 7 is 7,104.23 lbs (compression). Members 6 and 7 are “truss” members (axial-only).

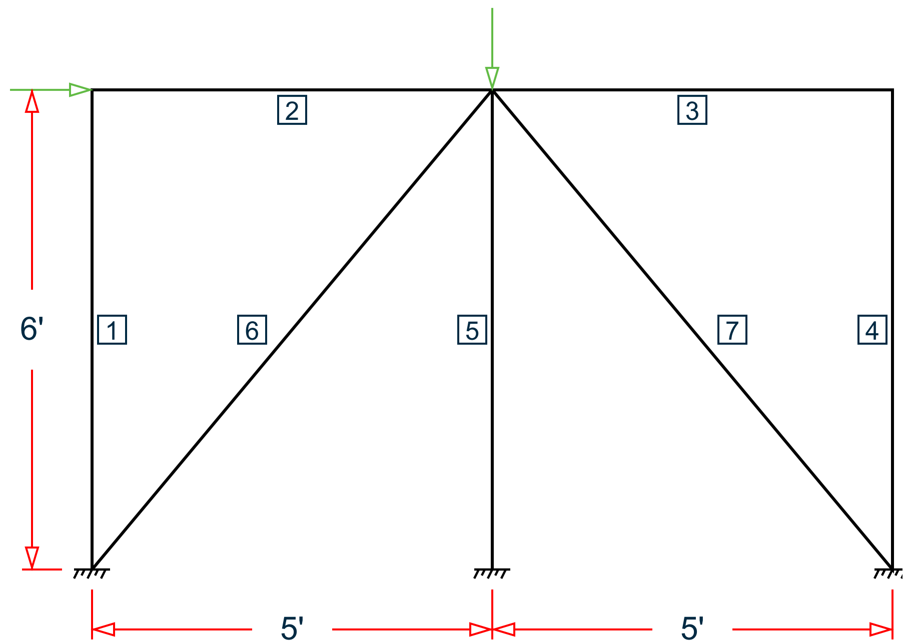

Figure 505: Space frame subjected to static loads

Both member 6 and 7 are L 80x60x10, grade A36 steel (F_y = *36 ksi*, F_u = *58 ksi*).

Assume a net section factor of 0.9, an effective length factor of 0.85, and C_t = 0.9.

Validation

$$L = \sqrt{5^2 + 6^2}(12\text{in/ft}) = 93.726\text{in}$$

Slenderness ratio (same for both members) using the minimum value of r: $kL/r_z = 0.85(93.726)/1.29 = 61.76$

For member 6, $kL/r_z = 61.76 < 300$

For member 7, $kL/r_z = 61.76 < 200$

Axial Tension: Member 6

Corrected area, $A_c = C_t \times A_x = 7.57\ in^2$

Actual tensile stress = $P/A = 2{,}666.18\ /\ 7.57 = 352.2\ psi$

Allowable tensile stress (Tension capacity) = $0.6 \times Fy = 0.6 \times 36 = 21.6\ ksi$

Critical ratio = 352.2/21600 = 0.016

Axial Compression: Member 7

Actual compressive stress = $P/A = 7{,}104.23\ /\ 8.41 = 844.74\ psi$

$$C_c' = \sqrt{\frac{2\pi^2 E}{Q_s Q_a F_y}} = 126.2$$

$(kL/r)min < C_c'$, allowable compression stress, $F_a = 17.2\ ksi$

Critical ratio = $844.74\ /\ 17{,}200 = 0.049$

Results

Table 820: Comparison of results

Parameter		Hand Calculation	STAAD.Pro	Difference	Comments
Member 6 (tension)	Slenderness ratio	61.76	61.76	none	
	Actual tensile stress (psi)	352	352	none	
	Allowable tensile stress (psi)	21,600	21,600	none	
	Critical ratio	0.016	0.016	none	
Member 7 (compression)	Slenderness ratio	61.76	61.76	none	
	Actual tensile stress (psi)	845	845	none	
	Allowable tensile stress (psi)	17,200	17,200	none	
	Critical ratio	0.049	0.049	none

- *D1.K.2. ANSI/AISC N690-1984 Code* (on page 1303)

V. AISC N690 1984 Channel

Verify the design of channel section used for a beam member using the AISC N690 1984 code.

Details

The beam is a propped cantilever 80 inches long. The beam is loaded with a 2 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is C15x50 channel section with Grade A36 steel.

Validation

Maximum shear force (at fixed end): V = 51.375 kips (taken from STAAD.Pro analysis)

Maximum moment (at fixed end): M = 830.0 in-kip (taken from STAAD.Pro analysis)

Slenderness Ratio

About z-axis: $(KL/r)_z = 0.85(80\ in)/(5.25\ in) = 12.95$

About y-axis: $(KL/r)_y = 0.85(80\ in)/(0.865\ in) = 78.61$

Max. slenderness ratio < 300, OK.

Bending About Major Axis (Z Axis)

$$\frac{b_f}{t_f} = 4.62 < \frac{65}{\sqrt{F_y}} = 10.83$$

The laterally unsupported length of the compression flange, $L_b = 80 < \frac{76 b_f}{\sqrt{F_y}} = 120$

and $< \frac{20,\ 000}{(d\ /\ A_f)F_y} = 89.56$

As b_f/t_f is not in the range of $65/\sqrt{(Fy)}$ and $95/\sqrt{(Fy)}$, the value of allowable bending compressive and tensile stress = $F_{bty} = F_{bcy} = 0.6 \times F_y = 21.6\ ksi$

Actual bending stress:

Bending Tensile Stress = bending compressive stress = $f_{btz} = f_{bcz} = MzD\ /\ (2I_z) = 15.4\ ksi$

$$830.0\ (15.0)\ /\ (2 \times 404) = 15.41\ \text{ksi}$$

Critical ratio = 15.41 ksi / 21.6 ksi = 0.713

Shear

Actual shear:

$F_y = 51.375$ kips

$V_y = D \times t_w = 10.8\ \text{in}^2$

fv,y = Fy/Vy = 4.76 ksi

Allowable shear:

a = clear distance between transverse stiffeners (here taken as length) = 80 in

h = clear distance flanges of the girder = $D\text{-}2t_f = 14.35\ in$

Thus, $a/h = 5.57$, Therefore, $k = 5.34 + [4.00/\ (a/h)^2] = 5.46$

$t = t_w = 0.72$ inch

$Cv = 17.2$

$F_v = (F_y/2.89)C_v \geq 0.4 \times F_y = 14.4$ ksi

Hence allowable=14.4 ksi

Therefore, Ratio = $f_v / F_v = 0.330$

Results

Table 821: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Slenderness ratio	78.61	78.61	none

V. AISC N690 1984 Pipe Section With SLC

Verify the design of a pipe section used for a beam member per the AISC N690 1984 code.

References

Gere, J. M. and S. P. Timoshenko. 1984. *Mechanics of Materials, 2nd Edition*. Boston, MA: PWS Publishers. p.238.

Related Links

- *D1.K.2. ANSI/AISC N690-1984 Code* (on page 1303)

Details

The 10 ft long span is a propped cantilever which is free to move axially at the fixed end. The beam is subject to the following four different load cases:

1. a 10 kip axial tension force,
2. a 10 kip axial compression force,
3. a uniformly distributed load of 0.3 kip/ft in the Global Y and Z directions, the member selfweight (acts in Global Y), and the tension load from case 1
4. a uniformly distributed load of 0.3 kip/ft in the Global Y and Z directions, the member selfweight (acts in Global Y), and the compression load from case 2

The member is Pipe 5-Sched. 40 (standard) pipe section with Grade A36 steel. The self-weight is 14.6 lbs/ft.

Validation

Slenderness Ratio

The slenderness ratio is the same about either local z or y axes: $KL/r = 120\ in\ /\ 1.888\ in = 63.56 < 300$, OK

Axial Tension

From section Q1.5.1.1, the allowable tensile stress:

$$F_t = \min \left| \begin{array}{l} 0.6F_y = 0.6 \times 36 = 21.6 \text{ ksi} \\ 0.5F_u = 0.5 \times 58 = 29 \text{ ksi} \end{array} \right.$$

The actual tensile stress from load case 1:

$$f_t = \frac{P}{A} = \frac{10}{4.01} = 2.49 \text{ ksi} < F_t$$

Stress ratio = $2.49\ /\ 21.6 = 0.115$, hence OK.

Axial Compression

Allowable compressive stress per Cl Q1.9.2.3:

$$\frac{\text{OD}}{t} = \frac{5.56}{0.24} = 23.17 < \frac{3{,}300}{F_y} = \frac{3{,}300}{36} = 91.67$$

$$C_c = \sqrt{\frac{2\pi^2 E}{F_y}} = 126.1$$

Since $Kl/r < C_c$, per eq. Q1.5-1, the allowable axial compressive stress:

$$F_a = \frac{1 - \frac{\left(kl/r\right)^2}{2 \times C_c^2}}{\frac{5}{3} + 3 \times \frac{kl/r}{8 \times C_c} - \frac{\left(kl/r\right)^3}{8 \times C_c^3}} F_y = 17.08 \text{ ksi}$$

The actual compressive stress from load case 2:

$$f_a = \frac{P}{A} = \frac{10}{4.01} = 2.49 \text{ ksi} < F_a$$

Stress ratio = *2.49 / 17.08 = 0.146*, hence OK.

Bending

Section is compact per Cl Q1.5.1.4.1: $\frac{OD}{t} = 23.17 < \frac{3,300}{F_y} = 91.67$

Allowable bending stress about both axes: $F_b = 0.66 \times F_y = 23.76\ ksi$

Moment due to load case 3 or 4 on a propped cantilever (ref. AISC Steel Construction Manual):

$$M_z = \frac{w \times l^2}{8} = \frac{0.314 \times 10^2}{8} = 3.93 \text{ ft}\cdot\text{k} = 47.2 \text{ in}\cdot\text{k}$$

$$M_y = \frac{w \times l^2}{8} = \frac{0.3 \times 10^2}{8} = 3.75 \text{ ft}\cdot\text{k} = 45 \text{ in}\cdot\text{k}$$

Actual bending stress about the major axis: $f_{bz} = \frac{M_z}{I_z}\left(\frac{OD}{2}\right) = \frac{47.2}{14.3}\left(\frac{5.56}{2}\right) = 9.17\ ksi$

Actual bending stress about the minor axis: $f_{by} = \frac{M_z}{I_z}\left(\frac{OD}{2}\right) = \frac{45.0}{14.3}\left(\frac{5.56}{2}\right) = 8.75\ ksi$

Stress ratio: *9.17 / 23.76 = 0.386*, hence OK.

Combined Bending and Axial Tension

Interaction per Cl Q1.6.2 in load case 3 (tension + bending):

$$\frac{f_a}{\texttt{SFT} \times 0.6F_y} + \frac{f_{by}}{\texttt{SMY} \times F_{by}} + \frac{f_{bz}}{\texttt{SMZ} \times F_{bz}} = \frac{2.49}{1.3 \times 21.6} + \frac{8.75}{1.4 \times 23.76} + \frac{9.17}{1.4 \times 23.76} = 0.627 \quad \text{(Eq. Q1.6-1b)}$$

Combined Bending and Axial Compression

Interaction per Cl Q1.6 in load case 4 (compression + bending):

$$\frac{f_a}{F_a} = 0.145 < 0.15 \quad \text{(Eq. Q1.6-2)}$$

$$\frac{f_a}{\texttt{SFC} \times F_a} + \frac{f_{by}}{\texttt{SMY} \times F_{by}} + \frac{f_{bz}}{\texttt{SMZ} \times F_{bz}} = \frac{2.49}{1.3 \times 17.08} + \frac{8.75}{1.4 \times 23.76} + \frac{9.17}{1.4 \times 23.76} = 0.651$$

Shear

Actual shear (at supports):

$$f_{\text{v,y}} = \frac{5w \times l}{8} = \frac{5 \times 0.315 \times 10}{8} = 1.97 \text{ kip}$$

$$f_{\text{v,z}} = \frac{5w \times l}{8} = \frac{5 \times 0.3 \times 10}{8} = 1.88 \text{ kip}$$

Shear area (calculated as per Gere & Timoshenko reference):

$$\text{A}_z = \frac{\frac{\pi}{4}\left(\text{r}_2{}^4 - \text{r}_1{}^4\right) \times 2\left(\text{r}_2 - \text{r}_1\right)}{\frac{2}{3}\left(\text{r}_2{}^3 - \text{r}_2{}^3\right)}$$

where

r_1 = the inner radius of the pipe = *5.56 / 2 - 0.24 = 2.54 in*

r_2 = the outer radius of the pipe = $5.56\ /\ 2 = 2.78\ in$

Thus, the shear area along both axes = $2.008\ in^2$.

$$F_{vy} = \frac{F_{v,y}}{A_y} = \frac{1.97}{2.008} = 0.98 \text{ ksi}$$

$$F_{vz} = \frac{F_{v,z}}{A_y} = \frac{1.88}{2.008} = 0.94 \text{ ksi}$$

The allowable shear stress:

$$F_v = 0.4F_y = 14.4 \text{ ksi}$$

Stress ratio in Y (minor axis): $0.98/14.4 = 0.068$, hence OK.

Stress ratio in Z (major axis): $0.94/14.4 = 0.065$, hence OK.

Results

Table 822: Comparison of results

V. AISC N690 1984 Pipe

Verify the design of a pipe section used for a beam member per the AISC N690 1984 code.

Reference

Timoshenko & Gere. *Mechanics of Materials*. 2nd Edition. p.238

Related Links

- *D1.K.2. ANSI/AISC N690-1984 Code* (on page 1303)

Details

The simply supported beam is 50 inches long. The beam is loaded with a 1.5 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is PIPS 120 pipe section with Grade A36 steel.

Validation

Maximum shear force, $V = \frac{P}{2} + \frac{wL}{2} = \frac{1.5}{2} + \frac{1.0(50)}{2} = 25.75 kips$

Maximum moment, $M = \frac{PL}{4} + \frac{wL^2}{8} = \frac{1.5(50)}{4} + \frac{1.0(50)^2}{8} = 331.25 in \cdot kip$

Slenderness ratio = (KL/r) = 9.72 < 300

<u>Bending About Major Axis (Z-Axis)</u>

Section is compact: $\frac{OD}{t} = 36.43 < \frac{3,300}{F_y} = 91.67$

Allowable bending stress: $F_b = 0.66 \times F_y = 23.76$ ksi

Actual bending stress: $f_{btz} = f_{bcz} = \frac{M_z}{I_z}\left(\frac{OD}{2}\right) = \frac{331.25}{262}\left(\frac{12.75}{2}\right) = 8.06 ksi$

Stress ratio: 0.339

<u>Shear</u>

From the reference, the shear area:

$$A_y = \frac{0.25\pi\left(r_2{}^4 - r_1{}^4\right)2\left(r_2 - r_1\right)}{\frac{2}{3}\left(r_2{}^3 - r_1{}^3\right)}$$

where

r_1	=	inner radius
r_2	=	outer radius

Shear area: $A_y = 6.8\ in^2$

Actual shear stress (at supports): $f_v = 25.75\ /\ 6.8 = 3.78$ ksi

Actual shear stress (at midspan): $f_v = 0.75 / 6.8 = 0.110\ ksi$

Allowable shear stress, $F_v = 0.4 \times F_y = 14.4\ ksi$

Stress ratio: 3.78/14.4 = 0.263

Results

Table 823: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments

V. AISC N690 1984 Tee

Verify the design of a pipe section used for a beam member per the AISC N690 1984 code.

Details

A cantilever beam is 60 in long. The beam is loaded at the free end with a 2 kip load and a uniform load of 1 kip/in along the entire length.

The member is a WT18x67.5 section with Grade A36 steel.

Validation

Maximum shear force (at support) = $V = wL + P = (1\ kip/in) \times 60\ in + 2\ kip = 62\ kips$

Maximum moment (at support) = $M = 0.5 \times w \times L^2 + P \times L = 0.5\ (1\ kip/in) \times (60\ in)^2 + (2\ kip) \times (60\ in) = 1{,}920\ in \cdot kips$

<u>Slenderness Ratio</u>

Slenderness Ratio along Z-Axis = $(KL/r)_z = 21.22$

Slenderness Ratio along Y-Axis = $(KL/r)_y = 50.53$

Maximum Slenderness Ratio = $50.53 < 300$

<u>Bending</u>

Allowable Bending Stress About Major Axis (Z Axis)

$$b_f/2t_f = 4.65 > 65/\sqrt{(F_Y)} = 10.833$$

$$d/t_w = 28.3 < 640/\sqrt{(F_Y)} = 106.67$$

Thus allowable bending stress is obtained by treating the section as compact.

$$F_b = 0.66 \times F_Y = 23.8\text{ ksi}$$

Actual Bending Stress

Bending Tensile Stress = $f_{btz} = (Mz/Iz) \times Y_{bar} = 14.93\ ksi < 23.8\ ksi$

Bending Compressive Stress = $f_{bcz} = 38.7\ ksi > 23.8\ ksi$

Critical stress ratio = $38.7\ ksi\ /\ 23.8\ ksi = 1.626$

Shear

Allowable Shear Stress

a = clear distance between transverse stiffeners (here taken as length) = 60 in

h = clear distance flanges of the girder = $D\text{-}t_f = 17.01\ in$

Thus, a/h = 3.527 Therefore, $k = 5.34 + [4.00/\ (a/h)^2] = 5.65$

$$t = t_w = 0.44\text{ inch}$$

If Cv > 0.8, $Cv = [190/(h/t)]\sqrt{(k/Sy)} = 78.4$ which is true. Thus, the value of Cv is taken as 78.4

Allowable shear stress = $Fv = (FY/2.89)Cv \leq 0.4F_y = 14.4\ ksi$

Hence allowable shear =14.4ksi

Actual Shear

$$Vy = Dt_w = 10.68\text{ in}^2$$

$$fv = Fy/Vy = 5.805\text{ ksi}$$

Stress ratio = fv/Fv = 0.403

Allowable bending stress about minor axis, $f_{btz} = 0.75 \times F_y = 27\ ksi$

Results

Table 824: Verification comparison for AISC_N690_1984_Tee

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Slenderness ratio	50.53	50.53	none	
Allowable bending stress (ksi)	23.8	23.8	none	
Actual bending stress (ksi)	38.7	38.5	0.5%	
Critical shear ratio	1.626	1.620	0.4%	
Allowable shear stress (ksi)	14.4	14.4	none	
Actual shear stress (ksi)	5.81	5.81	none	
Shear stress ratio	0.403	0.403	none

V. AISC N690 1984 W Shaped

Verify the design of a wide-flange section used for a cantilever beam using the AISC N690 1984 code.

Details

The beam is a 10 ft cantilever with a 12.5 kip concentrated load at the free end.

The member is a W16X40 section with Grade A36 steel.

Validation

Maximum shear force (constant shear): $V = 12.5\ kips$

Maximum moment (at fixed end): $M = 12.5\ kips \times 120\ in = 1{,}500\ in \cdot kips$

<u>Slenderness Ratio</u>

$(KL/r)_z$ = Slenderness Ratio along Z-Axis = 18.11

$(KL/r)_y$ = Slenderness Ratio along Y-Axis = 76.68

Maximum Slenderness Ratio = 76.68 < 240 (Hence OK)

<u>Bending</u>

Allowable Bending Stress About Major Axis (Z Axis)

$$b_f/2t_f = 6.862 < 65/\sqrt{}(F_y)$$

Thus, allowable bending tensile stress = $F_{btz} = 0.66 \times F_y = 23.76\ ksi$

Actual bending stress About Major Axis

$$f_{btz} = M_z D / 2 \times I_z = 23.2 \text{ ksi}$$

Stress ratio = 23.2 ksi / 23.76 kis = 0.975

<u>Shear</u>

Allowable Shear Stress

$$F_v = 0.4 \times F_y = 14.4\ ksi$$

Actual Shear Stress

$$V_y = D \times t_w = 4.8 \text{ in}^2$$

$$f_v = F_y/V_y = 2.6 \text{ ksi}$$

Stress ratio = f_v/F_v = 0.18

Results

Table 825: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Slenderness ratio	76.68	76.68	none

2. Young, Warren C. and Richard G. Budynas. *Roark's Formulas for Stress and Strain.* Seventh Edition. New York, NY: McGraw Hill, 2002. p. 414

Details

The member is 10 ft long cantilever. The section used is a pair of 600T125-54 channels in a front-to-front configuration (no spacing between channel toes).

Section Properties

Properties of a 600T125-54 (listed as a 600CU125-54 in STAAD.Pro):

Depth, $D = 6.198\ in$
Flange width, $B = 1.250\ in$

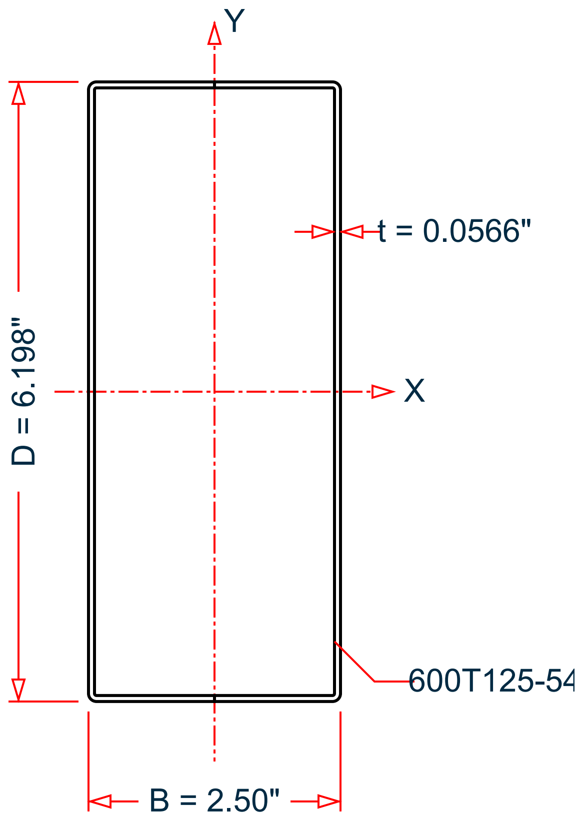
Thickness, $t = 0.0566\ in$
Inner radius, $R = 0.0849\ in.$
Cross-section area, $A = 0.48\ in^2$
Moment of inertia about the Z axis, $I_z = 2.34\ in^4$
Moment of inertia about the Y axis, $I_y = 0.0539\ in^4$
Heel to C.G. distance, $x = 0.204\ in$
Torsional constant, $J = 0.000513\ in^4$
Warping constant, $C_w = 0.348\ in^6$

Material Properties

$E = 29{,}000\ ksi$
$G = 11{,}200\ ksi$
$F_y = 36\ ksi$
$F_u = 58\ ksi$

Calculations

Section Properties



Average radius, $r = R + t/2 = 0.0849 + 0.0566\ /\ 2 = 0.113\ in.$
Clear depth of web, $a = D = (2\times r + t) = 6.198 - (2\times 0.113 + 0.0566) = 5.915\ in.$
Clear width of the flanges, $b = B - (r + t/2) = 1.25 - (0.113 + 0.0556\ /\ 2) = 1.109\ in.$
Cross-section area, $A = 2\times 0.48 = 0.96\ in^2$
Moment of inertia about the Z axis, $I_z = 2\times 2.34 = 4.68\ in^4$
Moment of inertia about the Y axis, $I_y = 2[0.0539 + 0.48\times(1.25 - 0.204)^2] = 1.158\ in^4$

Radius of gyration about the Z axis, $r_z = \sqrt{I_z/A} = \sqrt{\frac{4.68}{0.96}} = 2.21\ in$

Radius of gyration about the Y axis, $r_y = \sqrt{I_y/A} = \sqrt{\frac{1.158}{0.96}} = 1.10\ in$

Torsional constant, $J = 2\times 0.000513 = 0.00103\ in^4$

Center-to-center depth, $\bar{a} = D - t = 6.198 - 0.0566 = 6.141\ in$

Center-to-edge flange width, $\bar{b} = B - t/2 = 1.25 - 0.0566/2 = 1.222\ in$

Warping constant, $C_w = \frac{t\bar{a}^3}{24}\left(56\bar{b}^3 + 4\bar{a}\bar{b}^2\right) = \frac{0.0566(6.141)^3}{24}\left[56(1.222)^3 + 4(6.141)(1.222)^2\right] = 12.344\ in^6$
(Taken from Table 10.2, Case 4 of Reference 2; simplified for the case where $h = 2\times h_1$)

<u>Compression Capacity for Yielding and Global Buckling</u>

About the major axis:

The elastic flexural buckling stress

$$F_{crez} = \frac{\pi^2 E}{\left(\frac{K_z L_z}{r_z}\right)^2} = \frac{\pi^2 \times 29{,}000}{\left(\frac{1.0 \times 120}{2.21}\right)^2} = 96.9 \text{ ksi}$$ (Eq. E2.1-1)

$$\lambda_{cz} = \sqrt{\frac{F_y}{F_{crez}}} = \sqrt{\frac{36}{96.9}} = 0.610$$ (Eq. E2-4)

Since $\lambda_{cz} < 1.5$, the compressive strength is given by:

$$F_{nz} = 0.658^{\lambda_{cz}^2} \times F_y = 0.658^{(0.610)^2} \times 36 = 30.82 \text{ ksi}$$ (Eq. 2-2)

About the minor axis:

The elastic flexural buckling stress

$$F_{crey} = \frac{\pi^2 E}{\left(\frac{K_y L_y}{r_y}\right)^2} = \frac{\pi^2 \times 29{,}000}{\left(\frac{1.0 \times 120}{1.10}\right)^2} = 24.0 \text{ ksi}$$ (Eq. E2.1-1)

$$\lambda_{cy} = \sqrt{\frac{F_y}{F_{crey}}} = \sqrt{\frac{36}{24.0}} = 1.225$$ (Eq. E2-4)

Since $\lambda_{cy} < 1.5$, the compressive strength is given by:

$$F_{ny} = 0.658^{\lambda_{cy}^2} \times F_y = 0.658^{(1.225)^2} \times 36 = 19.20 \text{ ksi}$$ (Eq. 2-2)

The controlling compressive stress is the minimum of F_{nz} and F_{ny}: $F_n = 19.20$ *ksi*

The nominal axial compressive strength, $P_{ne} = A \times F_n = 0.96 \times 19.20 = 18.43$ *kips*

LRFD: $\phi_c P_{ne} = 0.85 \times 18.43 = 15.67$ *kips*
ASD: P_{ne}/Ω_c = 18.43 / 1.8 = 10.24 kips

Compression Capacity in Local Buckling

Global column stress about major axis (as defined in Section E2):

$$F_n = F_{ny} = 19.20 \text{ ksi}$$

Determine the effective area, A_e as per Appendix 1. The flanges of a front-to-front channel are considered stiffened elements.

Compression flange effective width:

w = b = 1.109 in (AISC Manual 3.3.2)

$$F_{cr\ell} = k \frac{\pi^2 E}{12\left(1 - \mu^2\right)}\left(\frac{t}{w}\right)^2$$ (E1. 1.1-4)

where

k	=	Plate bucking coefficient, = *4*
μ	=	Poisson's ratio of steel, = *0.3*

$$F_{cr\ell} = 4\frac{\pi^2 \times 29{,}000}{12\left[1 - (0.3)^2\right]}\left(\frac{0.0566}{1.1097}\right)^2 = 273.1 \text{ ksi}$$

The slenderness factor:

$$\lambda = \sqrt{\frac{F_n}{F_{cr\ell}}} = \sqrt{\frac{19.20}{273.1}} = 0.265 \quad \text{(Eq. 1.1-3)}$$

As $\lambda < 0.673$, the local reduction factor, $\rho = 1$. Therefore, the effective width of the compression flange is $b_f = \rho \times w = 1.109\ in$.

Web effective width:

$$w = a = 5.915 \text{ in} \quad \text{(AISC Manual 3.3.2)}$$

$$F_{cr\ell} = 4\frac{\pi^2 \times 29{,}000}{12\left[1 - (0.3)^2\right]}\left(\frac{0.0566}{5.915}\right)^2 = 9.60 \text{ ksi}$$

$$\lambda = \sqrt{\frac{F_n}{F_{cr\ell}}} = \sqrt{\frac{19.20}{9.60}} = 1.414$$

As $\lambda > 0.673$, the local reduction factor:

$$\rho = \left(1 - {}^{0.22}\!/_{\lambda}\right)/\lambda = \left(1 - {}^{0.22}\!/_{1.414}\right)/\,1.414 = 0.597$$

Therefore, the effective width of the compression flange is $b_w = \rho \times w = 0.597 \times 5.915 = 3.532\ in$

The total effective area is the gross area minus the difference in nominal widths and effective widths:

$$A_e = A - 4\times(b - b_f)t - 2\times(a - b_w)t = 0.96 - 4\times(1.109 - 1.109)\times0.0566 - 2\times(5.915 - 3.532)\times0.0566 = 0.69 \text{ in.}^2$$

$$P_{n\ell} = A_e F_n = 0.69 \times 19.20 = 13.25 < P_{ne} \quad \text{(Eq. E3.1-1)}$$

LRFD: $\phi_c P_{n\ell} = 0.85 \times 11.26 = kips$
ASD: $P_{n\ell}/\Omega_c = 13.26 / 1.8 = 7.36$ kips

Comparison

Table 826: Comparison of results

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Axial comp. per section E2 (kips)	15.67	15.671	negligible	
	Local comp. per section E3 (kips)	11.26	11.283	negligible	
ASD	Axial comp. per section E2 (kips)	10.24	10.242	negligible	
	Local comp. per section E3 (kips)	7.36	7.375	negligible	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISI\AISI 2016 2CU F2F Compressive Strength.STD` is typically installed with the program.

The following D1.E.5 Design Parameters (on page 1192) are used:

- The material properties for design are specified by the parameters `FYLD 36` and `FU 58`.
- A member with unreinforced webs is specified using `TSA 0`

V. AISI 2016 2CU F2F Tensile Strength

Verify the axial tensile strength of a double cold-formed channel section according to the AISI S100 2016 specification using both the LRFD and ASD methods.

Reference

1. American Iron and Steel Institute. *AISI Manual: Cold-formed Steel Design - Vol. 1.*. 2018. Milwaukee, WI.

Details

The member is 10 ft long cantilever. The section used is a pair of 600T125-54 channels in a front-to-front configuration (no spacing between channel toes). Assume a net section area of $0.90\times$ the gross section area.

<u>Section Properties</u>

Properties of a 600T125-54 (listed as a 600CU125-54 in STAAD.Pro):

Cross-section area, $A = 0.48\ in^2$

<u>Material Properties</u>

$E = 29{,}000\ ksi$
$G = 11{,}200\ ksi$
$F_y = 36\ ksi$
$F_u = 58\ ksi$

Calculations

Section Properties

Cross-section area, $A = 2\times\ 0.48 = 0.96\ in^2$

The net area of the cross section:

$$A_n = 0.9\times\ (0.96) = 0.864\ \text{in}^2$$

Tensile Yielding of Gross Section

$$T_n = A_g \times F_y = 0.96 \times 36 = 34.56 \quad \text{(Eq. D2-1)}$$

LRFD: $\phi_t T_n = 0.90 \times 34.56 = 31.10\ kips$
ASD: T_n/Ω_t = 34.56 / 1.67 = 20.69 kips

Tensile Rupture of Net Section

$$T_n = A_n \times F_y = 0.864 \times 58 = 50.11 \quad \text{(Eq. D3-1)}$$

LRFD: $\phi_t T_n = 0.75 \times 50.11 = 37.58\ kips$
ASD: T_n/Ω_t = 50.11 / 2.00 = 25.06 kips

Comparison

Table 827: Comparison of results

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Tensile Yielding of Gross Section, $\phi_t T_n$, (kN)	31.10	31.104	negligible	
	Tensile Rupture of Net Section, $\phi_t T_n$, (kN)	37.58	37.584	negligible	
ASD	Tensile Yielding of Gross Section, T_n/Ω_t, (kN)	20.69	20.695	negligible	
	Tensile Rupture of Net Section, T_n/Ω_t, (kN)	25.06	25.056	negligible	

STAAD Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISI\AISI 2016 2CU F2F Tensile Strength.STD` is typically installed with the program.

The following design parameters are used:

- The net section factor is specified using the `NSF 0.9` parameter.
- Unreinforced webs are specified using the `TSA 0` parameter.

V. AISI 2016 Channel section

Determine the flexural strength and shear strength of a cold-formed channel section without lips according to AISI S100 2016 Specification using both LRFD and ASD methods.

Details

The member is a simply-supported, 6 ft span. The member is subject to a uniform load of 194.4 lbs/ft. The section used is a 550CU125-54.

Section Properties

Depth of section, $d = 5.698\ in$
Width of section, $b = 1.25\ in$
Thickness, $t = 0.0566\ in$
Fillet radius, $r = 0.0849\ in$
Area, $A = 0.452\ in^2$
Moment of inertia major axis, $I_{zz} = 1.9\ in^4$
Moment of inertia minor axis, $I_{yy} = 0.053\ in^4$
Section modulus major axis, $Z_{zz} = 0.667\ in^3$
Section modulus minor axis, $Z_{yy} = 0.0512\ in^3$
Distance between centroid and shear center: $x_0 = -0.539\ in$
Radius of gyration about major axis: $r_x = \sqrt{I_x / A} = 2.053\ in.$
Radius of gyration about minor axis: $r_y = \sqrt{I_t / A} = 0.342\ in.$
Polar radius of gyration: $r_0 = \sqrt{r_x^2 + r_y^2 + x_0^2} = 2.15\ in.$
Torsion constant, $J = 0.00048\ in^4$

Material Properties

$E = 29{,}500\ ksi$
$G = 11{,}300\ ksi$
$F_y = 33\ ksi$

Design Forces

$M_z = 10.5\ ft \cdot k$
$V_y = 0.583\ kips$

Validation

Lateral-Torsional Buckling Strength

$$\sigma_{ey} = \frac{\pi^2 \times E}{\left(K_y \times L_y / r_y\right)^2} = \frac{\pi^2 \times 29{,}000}{\left(1 \times 72 / 0.342\right)^2} = 6.586 \text{ ksi}$$

$$\sigma_t = \frac{1}{A \times r_0^2} \times \left[G \times J + \frac{\pi^2 \times E \times C_w}{(Kt \times Lt)^2}\right] = \frac{1}{0.452(2.15)^2} \times \left[11{,}300 \times 0.000483 + \frac{\pi^2 \times 29{,}000 \times 0.315}{(1 \times 72)^2}\right] = 11.12 \text{ k}$$

$$C_b = 1.136$$

For singly symmetric sections bent about the axis of symmetry:

$$F_{cre} = \frac{C_b r_0 A}{S_f}\sqrt{\sigma_{ey}\sigma_t} = \frac{1.136(2.15)(0.452)}{0.668}\sqrt{6.586 \times 11.12} = 14.15 \text{ ksi}$$

where

S_f = the elastic section modulus for the unreduced section relative to the extreme compression fiber per AISI S100 2016. Hence, $S_f = S_z$.

For $F_{cre} < 0.56F_y = 0.56 \times 33 = 18.58$, $F_n = F_{cre}$.

$$M_{ne} = F_n \times S_f = 14.15 \times 0.667 = 9.433 \text{ in-k}$$

Allowable nominal lateral-torsional buckling strength (ASD):

$$\frac{M_{ne}}{\Omega_b} = \frac{9.433}{1.67} = 5.649 \text{ in}\cdot\text{kips}$$

Design nominal lateral-torsional buckling strength (LRFD):

$$\phi_b M_{ne} = 0.9 \times 9.433 = 8.49 \text{ in}\cdot\text{kips}$$

<u>Bending About Major Axis</u>

$$M_y = F_y \times S_f = 33 \times 0.667 = 22.01 \text{ in-k}$$

Allowable nominal bending strength (ASD):

$$\frac{M_y}{\Omega_b} = \frac{21.01}{1.67} = 13.18 \text{ in}\cdot\text{kips}$$

Design nominal bending strength (LRFD):

$$\phi_b M_y = 0.9 \times 22.01 = 19.81 \text{ in}\cdot\text{kips}$$

<u>Local Buckling Interaction with Yield and Global Buckling</u>

From Section F3:

$$S_e = 0.665 \text{ in}^3$$

$$M_{nl} = S_e \times F_n = 0.665 \times 14.15 = 9.412 \text{ in-k}$$

Allowable nominal bending strength (ASD):

$$\frac{M_{nl}}{\Omega_b} = \frac{9.412}{1.67} = 5.636 \text{ in}\cdot\text{kips}$$

Design nominal bending strength (LRFD):

$$\phi_b M_{nl} = 0.9 \times 9.412 = 8.471 \text{ in}\cdot\text{kips}$$

Governing strength ratio:

LRFD: 10.498 / 8.471 = 1.239

ASD: 10.498 / 5.636 = 1.862

<u>Shear Strength along Minor Axis</u>

$$h = D - 2\times(t - r) = 5.698 - 2\times(0.0566 - 0.0849) = 5.145 \text{ in}$$

$$h/t = 5.415 / 0.0566 = 95.67$$

$$A_w = h \times t = 5.415 \times 0.0566 = 0.307 \text{ in}^2$$

$$V_y = 0.6 \times A_w \times F_y = 0.6 \times 0.307 \times 33 = 6.069 \text{ kip}$$

$$F_{cr} = \frac{\pi^2 \times EK_v}{12\left(1 - \mu^2\right)\left(\frac{h}{t}\right)^2} = \frac{\pi^2 \times 29{,}000 \times 5.34}{12\left(1 - 0.3^2\right)(95.67)^2} = 15.56 \text{ ksi}$$

$$V_{cr} = A_w \times F_{cr} = 0.307 \times 15.56 = 4.75 \text{ kip}$$

$$\lambda_v = \sqrt{\frac{V_y}{V_{cr}}} = \sqrt{\frac{6.069}{4.75}} = 1.128$$

For $0.815 < \lambda_v \leq 1.227$,

$$V_n = 0.815\sqrt{V_{cr} \times V_y} = 0.815\sqrt{4.75 \times 6.069} \times 6.069 = 4.384 \text{ kip}$$

Allowable nominal shear strength (ASD):

$$\frac{V_n}{\Omega_v} = \frac{4.384}{1.60} = 2.739 \text{ kips}$$

Design nominal shear strength (LRFD):

$$\phi_v V_n = 0.95 \times 4.384 = 4.615 \text{ kips}$$

Governing strength ratio:

LRFD: 0.583 / 4.165 = 0.14

ASD: 0.583 / 2.74 = 0.213

Table 828: Comparison of results

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Major bending (in-k)	19.81	19.807	negligible	
	LTB bending (in-k)	8.49	8.49	none	
	Major local bending (in-k)	8.471	8.477	negligible	
	Bending ratio	1.239	1.238	negligible	
	Shear strength (kips)	4.165	4.163	negligible	
	Shear ratio	0.14	0.14	none	
ASD	Major bending (in-k)	13.18	13.178	negligible	
	LTB bending (in-k)	5.649	5.649	none	
	Major local bending (in-k)	5.636	5.64	negligible	
	Bending ratio	1.862	1.861	negligible

V. AISI 2016 CS Compressive Strength

Verify the compressive strength of a cold-formed channel section with lips per the AISI S100 2016 specification.

Details

A 10' long, simply supported beam is subjected to a 10 kip axial load (compression). The section used is a 362CS162-54, Grade 50 steel.

Section Properties

Taken from AISI Manual, Cold-Formed Steel Design - Vol. 1, 2017 Table I-2.

Area, $A_g = 0.422\ in^2$
Radius of gyration z axis, $r_z = 1.44in$
Radius of gyration y axis, $r_y = 0.605\ in$
Distance from centroid to shear center, $x_o = -1.28\ in$
Elastic section modulus y axis, $S_{fz} = 0.482\ in^3$
Elastic section modulus z axis, $S_{fy} = 0.142\ in^3$

Torsional constant, $J = 0.000451\ in^4$
Warping constant, $C_w = 0.457\ in^6$
$j = 2.02\ in$

Material Properties

$E = 29{,}000\ ksi$
$G = 11{,}300\ ksi$
$F_y = 50\ ksi$

Validation

The elastic flexural buckling stress about the z axis:

$$F_{\text{crez1}} = \frac{\pi^2 E}{(K_z L_z / r_z)^2} = \frac{\pi^2 \times 29{,}000}{(1 \times 120 / 1.44)^2} = 41.22 \text{ ksi} \quad \text{(Eq. E2.1-1)}$$

Polar radius of gyration of cross-section about shear center:

$$r_o = \sqrt{r_z^2 + r_y^2 + x_o^2} = 2.019 \text{ in} \quad \text{(Eq. E2.2-4)}$$

$$\beta = 1 - (x_o / r_o)^2 = 1 - \left(\frac{-1.28}{2.019}\right)^2 = 0.598 \quad \text{(Eq. E2.2-3)}$$

$$\sigma_t = \frac{1}{A_g r_o^2}\left[GJ + \frac{\pi^2 E C_w}{(K_t L_t)^2}\right] = \frac{1}{0.422 \times 2.019^2}\left[11{,}200 \times 0.000451 + \frac{\pi^2 \times 29{,}000 \times 0.457}{(1 \times 120)^2}\right] = 8.243 \text{ ksi} \quad \text{(Eq. E2.2-5)}$$

$$\sigma_{\text{ez}} = F_{\text{crez}} = 41.22 \text{ ksi} \quad \text{(Eq. E2.2-6)}$$

The flexural-torsional buckling stress:

$$F_{\text{cre}} = \frac{1}{2\beta}\left[\left(\sigma_{\text{ez}} + \sigma_t\right) - \sqrt{(\sigma_{\text{ez}} + \sigma_t)^2 - 4\beta\sigma_{\text{ez}}\sigma_t}\right] \quad \text{(Eq. E2.2-1)}$$

$$= \frac{1}{2 \times 0.598}\left[\left(41.22 + 8.197\right) - \sqrt{(41.22 + 8.197)^2 - 4 \times 0.598 \times 41.22 \times 8.197}\right] = 7.560 \text{ ksi}$$

The elastic global buckling stress about the z axis is the minimum of F_{cre} and F_{crez1}; so $F_{crez} = 7.560\ ksi$.

The compressive stress capacity is:

$$\lambda_{\text{cz}} = \sqrt{\frac{F_y}{F_{\text{cre}}}} = \sqrt{\frac{50}{7.560}} = 2.572 > 1.5 \quad \text{(Eq. E2-4)}$$

$$F_{\text{nz}} = \left(\frac{0.877}{\lambda_{\text{cz}}^2}\right)F_y = \frac{0.877}{(2.579)^2}50 = 6.630 \text{ ksi}$$

The elastic flexural buckling stress about the y axis:

$$F_{\text{crey1}} = \frac{\pi^2 E}{(K_y L_y / r_y)^2} = \frac{\pi^2 \times 29{,}000}{(1 \times 120 / 0.536)^2} = 7.275 \text{ ksi} \quad \text{(Eq. E2.1-1)}$$

The elastic global buckling stress about the z axis is the minimum of F_{cre} and F_{crey1}; so $F_{crey} = 7.275\ ksi$.

$$\lambda_{\text{cy}} = \sqrt{\frac{F_y}{F_{\text{crey}}}} = \sqrt{\frac{50}{7.275}} = 2.622 > 1.5 \quad \text{(Eq. E2-4)}$$

$$F_{ny} = \left(\frac{0.877}{\lambda_{cy}{}^2}\right)F_y = \frac{0.877}{(2.622)^2}50 = 6.380 \text{ ksi} \quad \text{(Eq. E2-2)}$$

Global buckling about the Y axis governs.

Nominal capacity against global buckling:

$$P_n = A_g F_n = 0.422 \times 6.380 = 2.692 \text{ kips}$$

The available axial strength:

LRFD: $\phi_c P_n = 0.85 \times 2.692 = 2.289$ *kips*
ASD: P_n/Ω_c = 2.692 / 1.8 = 1.496 kips

Determine the compression capacity for local buckling interacting with yielding and global buckling as per E3:

The effective area, A_e, is equal to the gross area, $A_g = 0.422\ in^2$. By inspection, the local capacity, $P^{n\ell}$ is equal to the global buckling capacity in this case.

LRFD: $\phi_c P_{n\ell} = 0.85 \times 2.692 = 2.289$ *kips*
ASD: $P_{n\ell}/\Omega_c$ = 2.692 / 1.8 = 1.496 kips

Determine the compression capacity for distortional buckling as per E4:

The elastic distortional buckling stress, $F_{crd} = 149.8$ *ksi*.

The elastic distortional buckling load, $P_{crd} = A_g \times F_{crd} = 0.422 \times 149.8 = 63.21$ *kips*.

$$P_y = A_g \times F_y = 0.422 \times 50 = 21.1 \text{ kips} \quad \text{(Eq. E4.1-4)}$$

$$\lambda_d = \sqrt{\frac{P_y}{P_{crd}}} = \sqrt{\frac{21.1}{63.21}} = 0.578 > 0.561 \quad \text{(Eq. E4.1-3)}$$

$$P_{nd} = \left[1 - 0.25\left(\frac{P_{crd}}{P_y}\right)^{0.6}\right]\left(\frac{P_{crd}}{P_y}\right)^{0.6} P_y \quad \text{(Eq. 4.1-2)}$$

$$= \left[1 - 0.25\left(\frac{63.21}{21.1}\right)^{0.6}\right]\left(\frac{63.21}{21.1}\right)^{0.6} 21.1 = 21.08 \text{ ksi}$$

The available axial strength:

LRFD: $\phi_c P_{nd} = 0.85 \times 21.08 = 17.91$ *kips*
ASD: P_{nd}/Ω_c = 21.08 / 1.8 = 11.71 kips

Results

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Local compression capacity (kips)	2.289	2.282	negligible	
	Distorional buckling capacity (kips)	17.91	17.914	negligible	

Result Type		Reference	STAAD.Pro	Difference	Comments
	Axial compression capacity (kips)	2.289	2.282	negligible	
ASD	Local compression capacity (kips)	1.496	1.491	negligible	
	Distorional buckling capacity (kips)	11.71	11.709	negligible	
	Axial compression capacity (kips)	1.496	1.491	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\ Verification Models\09 Steel Design\US\AISI\AISI 2016 CS Compressive Strength.STD` is typically installed with the program.

V. AISI 2016 CS Flexural Strength

Verify the flexural strength of a cold-formed channel section according to the AISI S100 2016 specification using both the LRFD and ASD methods.

Details

A 5' long, simply supported beam is subjected to a concentrated load of 1 kip/in at midspan in both the global Y and Z directions. The section used is a 12CS4x105, Gr. 36 steel.

Section Properties

Taken from AISI Manual, Cold-Formed Steel Design - Vol. 1, 2017 Table I-1.

Area, $A_g = 2.20\ in^2$
Radius of gyration z axis, $r_z = 4.65in$
Radius of gyration y axis, $r_y = 1.39\ in$
Distance from centroid to shear center, $x_o = -2.63\ in$
Elastic section modulus y axis, $S_{fy} = 1.45\ in^3$
Elastic section modulus z axis, $S_{fz} = 7.91\ in^3$
Torsional constant, $J = 0.00808\ in^4$
Warping constant, $C_w = 122\ in^6$
$j = 6.74\ in$

Material Properties

$E = 29{,}000\ ksi$
$G = 11{,}300\ ksi$
$F_y = 36\ ksi$

Validation

The modification factor, C_b, for a simply-supported beam under a concentrated load at midspan:

$$C_b = \frac{12.5 \times M_{\text{max}}}{2.5 \times M_{\text{max}} + 3 \times M_{\text{a}} + 4 \times M_{\text{b}} + 3 \times M_{\text{c}}} = 1.32 \quad \text{(Eq. F2.1.1-2)}$$

Polar radius of gyration of cross-section about shear center:

$$r_o = \sqrt{{r_z}^2 + {r_y}^2 + {x_o}^2} = 5.52 \text{ in} \quad \text{(Eq. F2.1.1-3)}$$

Major axis bending:

$$\sigma_{\text{ey}} = \frac{\pi^2 E}{(K_y L_y / r_y)^2} = \frac{\pi^2 \times 29{,}000}{(1 \times 60 / 1.39)^2} = 153.6 \text{ ksi} \quad \text{(Eq. F2.1.1-4)}$$

$$\sigma_t = \frac{1}{A{r_o}^2}\left[GJ + \frac{\pi^2 E C_w}{(K_t L_t)^2}\right] = \frac{1}{2.20 \times 5.52^2}\left[11{,}200 \times 0.00808 + \frac{\pi^2 \times 29{,}000 \times 122}{(1 \times 60)^2}\right] = 146.0 \text{ ksi} \quad \text{(Eq. F2.1.1-5)}$$

$$F_{\text{cre}} = \frac{C_b r_o A}{S_f}\sqrt{\sigma_{\text{ey}} \times \sigma_t} = \frac{1.32 \times 5.52 \times 2.20}{7.91}\sqrt{153.6 \times 146.0} = 299.4 \text{ ksi} \quad \text{(Eq. F2.1.1-1)}$$

Per F2.1, where $F_{cre} > 2.78F_y = 2.78(36) = 100.1\ ksi$, $F_n = F_y$ (Eq. F2.1-3).

Nominal capacity against lateral-torsional buckling about the major axis:

$$M_{nez} = S_{fz}F_n = 7.91 \times 36 = 284.8 \text{ in·kips}$$

The available flexural strength about the major axis:

LRFD: $\phi_b M_{nez} = 0.9 \times 284.8 = 256.3 \text{ in·kips}$
ASD: $M_{nez}/\Omega_b = 284.8 / 1.67 = 170.5$ in·kips

Minor axis bending:

$$\sigma_{ez} = \frac{\pi^2 E}{(K_z L_z / r_z)^2} = \frac{\pi^2 \times 29{,}000}{(1 \times 60 / 4.65)^2} = 1{,}719 \text{ ksi} \quad \text{(Eq. F2.1.2-2)}$$

Simply-supported beam, so $C_{TF} = 1$; assume compression on shear center side of centroid, so $C_S = +1$.

$$F_{cre} = \frac{C_S A \sigma_{ez}}{C_{TF} S_f}\left[j + C_S \sqrt{j^2 + r_o^2 (\sigma_t / \sigma_{ez})} \right] = \frac{1.0 \times 2.20 \times 1{,}719}{1.0 \times 1.45}\left[6.74 + 1.0\sqrt{(6.74)^2 + (5.52)^2 (146.0 / 1{,}719)} \right] =$$

Per F2.1, where $F_{cre} > 2.78F_y = 2.78(36) = 100.1 \text{ ksi}, F_n = F_y$ (Eq. F2.1-3).

Nominal capacity against lateral-torsional buckling about the major axis:

$$M_{ney} = S_{fy}F_n = 1.45 \times 36 = 52.2 \text{ in·kips}$$

The available flexural strength about the major axis:

LRFD: $\phi_b M_{ney} = 0.9 \times 52.2 = 47.0 \text{ in·kips}$
ASD: $M_{ney}/\Omega_b = 52.2 / 1.67 = 31.3$ in·kips

Results

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Flexural capacity about major axis (in·kips)	256.3	256.5	negligible	
	Flexural capacity about minor axis (in·kips)	47.0	46.898	negligible	
ASD	Flexural capacity about major axis (in·kips)	170.5	170.659	negligible	
	Flexural capacity about minor axis (in·kips)	31.3	31.203	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISI\AISI 2016 CS Flexural Strength.STD` is typically installed with the program.

V. AISI 2016 CU Nominal and Local Axial Capacity

Determine the nominal axial capacity and local axial capacity of a 72-Inch-long member subjected to axial compression load.

Details

The member is a 6' simply-supported span subject to a 1 kip axial load. The section used is a 800CU125-68 channel without lips.

Section properties:

Depth: $D = 8.25\ in$
Width: $B = 1.25\ in$

Thickness: $t = 0.0713\ in$
Inner radius: $R = 0.1069\ in$
Area: $A = 0.748\ in^2$
Moment of inertia about major axis: $I_x = 6.0\ in^4$
Moment of inertia about minor axis: $I_y = 0.0703\ in^4$
Torsional constant: $J = 0.00127\ in^4$
Distance between centroid and shear center: $x_0 = -0.427\ in$
Radius of gyration about major axis: $r_x = \sqrt{I_x / A} = 2.832\ in.$
Radius of gyration about minor axis: $r_y = \sqrt{I_t / A} = 0.307\ in.$
Polar radius of gyration: $r_0 = \sqrt{r_x^2 + r_y^2 + x_0^2} = 2.881\ in.$
Warping constant: $C_w = 0.92\ in^6$

Material properties:

$E = 29{,}500\ ksi$
$G = 11{,}300\ ksi$
$F_y = 50\ ksi$

Validation

Section Dimension Checks

Radius to thickness ratio:

$$\frac{R}{t} = \frac{0.1069}{0.0713} = 1.499 < 10 \ \ \text{(OK)}$$

Width to thickness ratio:

$$W = (B - R - t) = 1.072 \text{ in}$$

$$\frac{W}{t} = \frac{1.072}{0.0713} = 15.03 < 60 \ \ \text{(OK)}$$

Depth to thickness ratio:

$$d = (D - 2R - 2t) = 7.849 \text{ in}$$

$$\frac{d}{t} = \frac{7.849}{0.0713} = 110.7 < 200 \ \ \text{(OK)}$$

Nominal Strength of Global Buckling

From Cl. E.2 of AISI S100-16:

$$\frac{K_y \times L_y}{r_y} = \frac{1 \times 72}{0.307} = 234.9$$

$$\sigma_x = \frac{\pi^2 \times E}{\left(\frac{K_x \times L_x}{r_x}\right)^2} = \frac{\pi^2 \times 29000}{\left(1 \times 72 / 2.832\right)^2} = 442.9 \text{ ksi}$$

$$F_{crey} = \frac{\pi^2 \times E}{\left(\frac{K_y \times L_y}{r_y}\right)^2} = \frac{\pi^2 \times 29000}{(234.9)^2} = 5.189 \text{ ksi}$$

$$\sigma_t = \frac{1}{A \times r_0^2} \times \left[G \times J + \frac{\pi^2 \times E \times C_w}{(Kt \times Lt)^2} \right] = \frac{1}{0.748(2.881)^2} \times \left[11{,}300 \times 0.001 + \frac{\pi^2 \times 29{,}000 \times 0.92}{(1 \times 72)^2} \right] = 10.50 \text{ ksi}$$

$$\beta = 1 - \frac{x_0}{r_0}^2 = 1 - \left(\frac{-0.427}{2.881} \right)^2 = 0.978$$

$$F_{(cre)TF} = \frac{1}{2 \times \beta} \times \left[\sigma_{ex} + \sigma_t - \sqrt{(\sigma_{ex} + \sigma_t)^2 - 4 \times \beta \times \sigma_{ex} \times \sigma_t} \right)$$

$$= \frac{1}{2 \times 0.978} \times \left[442.9 + 10.50 - \sqrt{(442.9 + 10.50)^2 - 4 \times 0.976 \times 442.9 \times 10.50} \right) = 10.49 \text{ ksi}$$

Since: $F_{(cre)TF} > F_{crey}$, $F_{(cre)} = 5.189\ ksi$

$$\lambda_c = \sqrt{\frac{F_y}{F_{(cre)}}} = 3.104 > 1.5$$

$$F_n = \frac{0.877}{\lambda_c^2} \times F_y = \frac{0.877}{(3.104)^2} \times 50 = 4.551 \text{ ksi}$$

$$P_{ne} = A \times F_n = 0.748 \times 4.551 = 3.404 \text{ kips}$$

Allowable nominal axial strength (ASD):

$$\frac{P_{ne}}{\Omega_c} = \frac{3.404}{1.80} = 1.891 \text{ kips}$$

Design nominal axial strength (LRFD):

$$P_{ne} \times \phi_c = 3.404 \times 0.85 = 2.893 \text{ kips}$$

<u>Local Buckling Interacting with Lateral-Torsional Buckling</u>

From Cl. E.3.1 of AISI S100-16:

Flange elements:

$$s = 1.28 \times \sqrt{\frac{E}{F_n}} = 1.28 \times \sqrt{\frac{29{,}000}{4.551}} = 102.2$$ (Eq 1.3-7, Appendix 1 of AISI S100-16)

$$\frac{W}{t} = 15.03 < 0.328 \times s = 33.51$$

Therefore, calculation of the effective width is not required.

Web element:

$$\frac{d}{t} = 110.7 < 500 \text{ (OK)}$$

$$k = 4.0$$

$$F_{cr} = \frac{k \times \pi^2 \times E}{12 \times \left(1 - \mu^2\right)} \times \left(\frac{t}{d}\right)^2 = \frac{4 \times \pi^2 \times 29{,}000}{12 \times \left(1 - 0.3^2\right)} \times \left(\frac{0.0713}{7.849}\right)^2 = 8.553 \text{ ksi}$$

$$\lambda = \sqrt{\frac{F_n}{F_{cr}}} = \sqrt{\frac{4.551}{8.553}} = 0.729$$

$$\rho = \frac{1 - \frac{0.22}{\lambda}}{\lambda} = 0.958$$

$$D_e = \rho \times d = 0.958 \times 7.894 = 7.562 \text{ in}$$

Effective area, $A_e = A - (d - D_e) \times t = 0.748 - (7.894 - 7.562) \times 0.0713 = 0.724\ in^2$

$$P_{nl} = A_e \times F_n = 0.724 \times 4.551 = 3.295 \text{ kips}$$

Allowable local axial strength (ASD):

$$\frac{P_{nl}}{\Omega_b} = \frac{3.295}{1.80} = 1.830 \text{ kips}$$

Design local axial strength (LRFD):

$$P_{nl} \times \phi_b = 3.295 \times 0.85 = 2.801 \text{ kips}$$

Results

Table 829: AISI 2016 Cylindrical Tubular Section comparison

Result Type	Reference	STAAD.Pro	Difference	Comments
Allowable nominal axial strength, ASD P_{ne}/Ω_c (kips)	1.891	1.891	none	
Allowable local axial strength, ASD P_{nl}/Ω_c (kips)	2.893	2.893	none	
Design nominal axial strength, LRFD $\phi_b P_n$ (kips)	1.830	1.830	none	
Design local axial strength, LRFD $\phi_b P_{nl}$ (kips)	2.801	2.800	negligible

V. AISI 2016 CU Nominal Moment Capacity

Determine the nominal moment axial capacity of a simply-supported beam subject to a concentrated load at mid-span.

Reference

Yu, Wei-Wen and Roger A. LaBoube. 2010 *Cold-Formed Steel Design, Fourth Edition*. Hoboken, NJ: Wiley. Example 4.3.

Related Links

- *D1.E.3 Design Procedure* (on page 1190)

Details

The member is a 10' simply-supported span subject to a 1 kip load applied at midspan. The section used is a CU_8X2_0.06 channel without lips. The member is laterally supported at the one-fourth points along the span.

Section properties:

Depth: $D = 8\ in$
Width: $B = 2\ in$
Thickness: $t = 0.06\ in$
Inner radius: $R = 3/32\ in$
Area: $A = 0.706\ in^2$
Moment of inertia about major axis: $I_x = 6.129\ in^4$
Moment of inertia about minor axis: $I_y = 0.229\ in^4$
Major axis section modulus: $S_x = 1.532\ in^3$
Minor axis section modulus: $S_y = 0.137\ in^3$
Torsional constant: $J = 0.00085\ in^4$
Distance between centroid and shear center: $x_0 = -0.919\ in$
Radius of gyration about major axis: $r_x = \sqrt{I_x / A} = 2.946\ in.$
Radius of gyration about minor axis: $r_y = \sqrt{I_t / A} = 0.569\ in.$
Polar radius of gyration: $r_0 = \sqrt{r_x^2 + r_y^2 + x_0^2} = 3.138\ in.$
Warping constant: $C_w = 2.568\ in^6$

Material properties:

$E = 29{,}500\ ksi$

G = 11,300 ksi
F_y *= 33 ksi*
F_u *= 58 ksi*

Validation

Elastic Critical Lateral-Torsional Stress Per Cl. F2.1.1 of AISI S100-16:

$$\sigma_{ey} = \frac{\pi^2 \times E}{\left(\frac{K_y \times L_y}{r_y}\right)^2}$$

where

K_y	=	Effective length factor for bending about y axis = *1*
L_y	=	Unbraced length of member for bending about y axis = *30 in*

So, $\sigma_{ey} = \frac{\pi^2 \times 29{,}000}{\left(\frac{1 \times 30}{0.569}\right)^2} = 103.1\ ksi$

$$C_b = \frac{12.5 \times M_{max}}{2.5M_{max} + 3M_A + 4M_B + 3M_C}$$

where

M_{max}	=	Absolute value of maximum moment in unbraced segment = *30 kip·in*
M_A	=	Absolute value of moment at quarter point of unbraced segment = *18.75 kip·in*
M_B	=	Absolute value of moment at mid-point of unbraced segment = *22.50 kip·in*
M_C	=	Absolute value of moment at three-quarter point of unbraced segment = *26.25 kip·in*

$$C_b = \frac{12.5 \times 30}{2.5 \times 30 + 3 \times 18.75 + 4 \times 22.5 + 3 \times 26.25} = 1.25 \quad \text{(Eq. F2.1.1-2)}$$

$$\sigma_t = \frac{1}{A \times r_0^2} \times \left[G \times J + \frac{\pi^2 \times E \times C_w}{(Kt \times Lt)^2}\right] = \frac{1}{0.706 \times 3.138^2} \times \left[11{,}300 \times 0.00085 + \frac{\pi^2 \times 29{,}000 \times 2.658}{(1 \times 30)^2}\right] = 12$$

The elastic buckling stress:

$$F_{cre} = C_b \times r_0 \times \frac{A}{S_x} \times \sqrt{\sigma_{ey} \times \sigma_t} = 1.25 \times 3.138 \times \frac{0.706}{1.532} \times \sqrt{103.1 \times 122.9} = 203.5\text{ ksi} \quad \text{(Eq. F2.1.1-1)}$$

Calculate the nominal flexural strength, F_n, per Cl. F2.1 of S100-16:

Since $F_{cre} > 2.78 \times F_y = 2.78 \times 33 = 97.74\ ksi$, $F_n = F_y = 33\ ksi$

The nominal flexural strength:

$$M_n = S_x \times F_y = 1.532 \times 33 = 50.57\text{ kip·in} \quad \text{(Eq. F2.1-1)}$$

Allowable flexural strength (ASD):

$$\frac{M_n}{\Omega_b} = \frac{50.57}{1.67} = 30.278\text{ kip·in}$$

Design flexural strength (LRFD):

$$M_n \times \phi_b = 50.57 \ \times 0.9 \ = 45.508 \text{ kip} \cdot \text{in}$$

Results

Table 830: AISI 2016 Cylindrical Tubular Section comparison

Result Type	Reference	STAAD.Pro	Difference	Comments
Flexural strength, ASD $^{M_{ne}}/_{\Omega_b}$ (in·kips)	30.278	30.278	none	
Flexural strength, LRFD $\phi_b M_{ne}$ (in·kips)	45.508	45.508	none

V. AISI 2016 Cylindrical Tubular Section

Determine the flexural strength of a closed cylindrical tubular member subjected to axial compression and bending moment according to AISI S100 2016 specification.

Reference

Cold-Formed Steel Design: AISI Manual. 2013 ed. Washington, D.C.: American Iron and Steel Institute, 2014. Example II-8.

Related Links

- *D1.E.3 Design Procedure* (on page 1190)

Details

The member is a 10' simply-supported span. The section is a 8" diameter closed cylindrical tube with a wall thickness of 0.1".

Axial loads:

Dead load: $P_{DL} = 7.5\ kips$
Roof live load: $P_{LR} = 20\ kips$

Transverse loads:

Wind load: $P_W = 50\ kips$ (concentrated load at mid-span)

Section properties:

Area: $A = 2.482\ in^2$
Moment of inertia: $I = 19.37\ in^4$
Section modulus: $S_f = 4.841\ in^3$
Radius of gyration: $r = \sqrt{I/A} = 2.794\ in.$

Material properties:

$E = 29{,}500\ ksi$
$G = 11{,}300\ ksi$
$F_y = 42\ ksi$
$F_u = 58\ ksi$

Validation

Design forces:

Governing load combination is DL + RLL + WL

$$Mu = 1.0\ (5\ kips)\ (120\ in)/4 = 150\ in \cdot kips$$

Section Dimension Checks

Check the outside diameter to wall thickness ratio:

$$D / t = 8.0 / 0.1 = 80$$

$$\frac{D}{t}_{Limit} \frac{0.441 \times E}{F_y} = \frac{0.441 \times 29500}{42} = 310 > 80$$

Hence, OK.

Determine Axial Capacity

Determine the governing equation for F_n:

$$\frac{0.0714 \times E}{F_y} = \frac{0.0714 \times 29500}{42} = 50.2$$

$$\frac{0.318 \times E}{F_y} = \frac{0.318 \times 29500}{42} = 223$$

Since: $\frac{0.0714 \times E}{F_y} < \frac{D}{t} < \frac{0.318 \times E}{F_y}$

$$F_n = \left[0.970 + 0.020\frac{E/(F_y)}{D/T}\right]F_y = \left[0.970 + 0.020\frac{29500/42)}{80}\right]42 = 48.1 \text{ ksi}$$

Determine Flexural Capacity

Nominal flexural strength (resistance) for yielding and global buckling:

$$M_{ne} = S_f \times F_n = 4.841 \times 48.1 = 233 \text{ in·kip}$$

Allowable flexural strength (ASD):

$$\frac{M_{ne}}{\Omega_b} = \frac{233}{1.67} = 140 \text{ in·kip}$$

Design flexural strength (LRFD):

$$M_{ne} \times \phi_b = 233 \times 0.95 = 221 \text{ in·kip}$$

Results

Table 831: AISI 2016 Cylindrical Tubular Section comparison

Result Type	Reference	STAAD.Pro	Difference	Comments
Flexural strength, ASD M_{ne}/Ω_b (in·kips)	140	139.481	negligible	
Flexural strength, LRFD $\phi_b M_{ne}$ (in·kips)	221	221.286	negligible

V. AISI 2016 Hat Section

Determine the flexural strength of a cold-formed hat section according to the AISI S100 2016 specification.

Reference

Cold-Formed Steel Design: AISI Manual. 2013 ed. Washington, D.C.: American Iron and Steel Institute, 2014. Example II-7.

Related Links

- *D1.E.3 Design Procedure* (on page 1190)

Details

The member is 6' simply supported span. The section is a 3HU4.5X135. The top flange is in compression and is fully braced. Inelastic reserve is not considered.

Member loads:

Dead load: $w_{DL} = 120\ plf$
Live load: $w_{LL} = 700\ plf$

Section properties:

$t = 0.135\ in$ (Note that STAAD.Pro uses a thickness of 0.14")
$R = 0.1875\ in$ (Note that STAAD.Pro uses a bend radius of 0.19")

Area: $A = 1.74\ in^2$
Moment of inertia, weak axis: $I_z = 2.47\ in^4$
Moment of inertia, strong axis: $I_y = 8.29\ in^4$
Section modulus, strong axis: $S_y = 1.52\ in^3$

Material properties:

$E = 29{,}500\ ksi$
$F_y = 50\ ksi$

Validation

Design forces

$$M_y = (0.12)(6)^2/8 + (0.7)(6)^2/8 = 3.69 \text{ ft·kips} = 44.3 \text{ in·kips}$$

$$M_{uy} = 1.2[(0.12)(6)^2/8] + 1.6[(0.7)(6)^2/8] = 5.69 \text{ ft·kips} = 68.3 \text{ in·kips}$$

Bending Capacity

Calculate nominal strength:

$$M_n = S_e \times F_y = 1.52 \times 50 = 76.0 \text{ in·kips}$$

Allowable strength:

$$\frac{M_n}{\Omega_b} = \frac{76.0}{1.67} = 45.5 \text{ in·kip}$$

Ultimate strength:

$$\phi_b M_{ne} = 0.90 \times 76.0 = 68.4 \text{ in·kip}$$

Results

Table 832:

Result Type	Reference	STAAD.Pro	Difference	Comments
Flexural strength, ASD M_{ne}/Ω_b (in·kips)	45.5	45.451	negligible	
Flexural strength, LRFD $\phi_b M_{ne}$ (in·kips)	68.4	68.313	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISI\AISI 2016 Hat Section.STD` is typically installed with the program.

V. AISI 2016 SHS section

Determine the flexural Strength and axial strength of a square hollow section according to AISI S100 2016 Specification using both LRFD and ASD methods.

Details

The member is a simply-supported, 10 ft span. The member is subject to a transverse uniform dead load of 100 lbs/ft. Additionally, the member is subject to a 7,500 lb axial dead load and a 37,500 lb axial live load. The section used is a HSS 6x6x0.125. The beam-column is *not* subject to moment or axial loading due to lateral translation of the structure.

Section Properties

Depth of section, $d = 6\ in$
Width of section, $b = 6\ in$
Thickness, $t = 0.125\ in$
Area, $A = 2.7\ in^2$
Moment of inertia, $I_{zz} = 15.5\ in^4$
Section modulus, $Z_{zz} = 5.167\ in^3$

Radius of gyration of cross-section: $r_x = \sqrt{I_x / A} = 2.393\ in.$

Torsion constant, $J = 23.63\ in^4$

Material Properties

$E = 29{,}500\ ksi$
$G = 11{,}300\ ksi$
$F_y = 46\ ksi$
$F_u = 58\ ksi$

Design Forces

ASD: $M_z = 15\ in \cdot k, P = 45\ kip$
LRFD $M_{uz} = 1.2\ (15) = 18\ in \cdot k, P_u = 1.2\ (\ 7.5) + 1.6\ (37.5) = 69\ kip$

Validation

Axial Compressive Strength

Nominal Flexural Buckling Stress

$$\frac{K_x \times L_x}{r_x} = \frac{K_y \times L_y}{r_y} = \frac{1.0 \times 120}{2.393} = 50.15$$

$$F_{\text{cre}} = \frac{\pi^2 \times E}{(K \times L\ / r)^2} = \frac{\pi^2 \times 29{,}500}{(50.15)^2} = 115.8 \text{ ksi}$$

$$\lambda_c = \sqrt{\frac{F_y}{F_{\text{cre}}}} = \sqrt{\frac{46}{115.8}} = 0.630 < 1.5$$

$$F_n = 0.658^{\lambda_c^2} \times F_y = 0.658^{(0.630)^2} \times 46 = 38.95 \text{ ksi}$$

$$P_n = A \times F_n = 2.7 \times 38.95 = 105.2 \text{ kips}$$

Allowable nominal axial strength (ASD):

$$\frac{P_n}{\Omega_c} = \frac{105.2}{1.80} = 58.43 \text{ kips}$$

Design nominal axial strength (LRFD):

$$\phi_c \times P_n = 0.85 \times 105.2 = 89.40 \text{ kips}$$

Nominal Sectional Flexural Strength

According to Eq. F2.1.4-1 in the specification, the minimum unbraced length of a closed box member subject to lateral-torsional buckling, L_u , is calculated as:

$$L_u = \frac{0.36 \times C_b \times \pi}{F_y \times S_f}\sqrt{EGJI_y} = 138 \text{ ft}$$

Since $L_u > 10\ ft$, global buckling does not need to be considered and $F_n = F_y = 46\ ksi$

$$M_y = S_f \times F_n = 5.167 \times 46 = 237.7 \text{ ksi}$$

Allowable nominal axial strength (ASD):

$$\frac{M_y}{\Omega_b} = \frac{237.7}{1.67} = 142.3 \text{ in} \cdot \text{kips}$$

Design nominal axial strength (LRFD):

$$\phi_b \times M_y = 0.90 \times 237.79 = 213.9 \text{ in} \cdot \text{kips}$$

Governing strength ratio:

LRFD: 18 / 213.9 = 0.084

ASD: 15 / 142.3 = 0.105

Table 833: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Design local axial strength, LRFD $\phi_c P_n$ (kips)	89.40	89.434	negligible	
Allowable local axial strength, ASD P_n / Ω_c (kips)	58.43	58.454	negligible	
Design section flexural strength, LRFD $\phi_b M_y$ (in·kips)	213.9	213.91	negligible	
Allowable section flexural strength, ASD M_y / Ω_b (in·kips)	142.3	142.315	negligible	
Strength ratio in major sectional bending (LRFD)	0.084	0.084	none	
Strength ratio in major sectional bending (ASD)	0.105	0.105	none	

STAAD.Pro Input File

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISI\AISI 2016 SHS section.STD` is typically installed with the program.

V. AISI 2016 Zee Section

Determine the axial strength and flexural strength of a cold-formed zee section without lips according to AISI S100 2016 Specification using the LRFD method.

Details

The member is a simply-supported, 2m span. The member is subject to a uniform load of 60 lbs/ft. The section used is an 8ZU 12.5x105.

Section Properties

Depth of section, $d = 8\ in$
Width of section, $b = 1.25\ in$
Thickness, $t = 0.105\ in$
Fillet radius, $r = 0.188\ in$
Area, $A = 1.059\ in^2$
Moment of inertia major axis, $I_{zz} = 7.88\ in^4$
Moment of inertia minor axis, $I_{yy} = 0.120\ in^4$
Section modulus major axis, $Z_{zz} = 1.97\ in^3$
Section modulus minor axis, $Z_{yy} = 0.096\ in^3$
Torsion constant, $J = 0.004\ in^4$
Warping constant, $C_w = 1.546\ in^6$

Radius of gyration about major axis: $r_x = \sqrt{I_x / A} = 2.728\ in.$

Radius of gyration about minor axis: $r_y = \sqrt{I_t / A} = 0.337\ in.$

Polar radius of gyration: $r_0 = \sqrt{r_x^2 + r_y^2 + x_0^2} = 2.749\ in.$

Material Properties

$E = 29{,}000\ ksi$
$G = 11{,}300\ ksi$
$F_y = 36\ ksi$

Design Forces

$M_z = 3.975\ ft \cdot k$
$V_y = 0.197\ kips$

Validation

Section Dimension Checks

Radius to thickness ratio:

$$\frac{R}{t} = \frac{0.188}{0.105} = 1.79 < 10 \ \ \text{(OK)}$$

Width to thickness ratio:

$$W = (B - R - t) = 0.957 \text{ in}$$

$$\frac{W}{t} = \frac{0.957}{0.105} = 9.11 < 60 \ \ \text{(OK)}$$

Depth to thickness ratio:

$$d = (D - 2R - 2t) = 7.414 \text{ in}$$

$$\frac{d}{t} = \frac{7.414}{0.105} = 70.60 < 200 \ \ \text{(OK)}$$

Calculate Axial Strength

Along Z axis:

$$\frac{K_x \times L_x}{r_x} = \frac{1 \times 78.74}{2.728} = 28.86$$

$$\sigma_x = \frac{\pi^2 \times E}{\left(\frac{K_x \times L_x}{r_x}\right)^2} = \frac{\pi^2 \times 29{,}000}{(28.86)^2} = 343.6 \text{ ksi}$$

$$\sigma_t = \frac{1}{A \times r_0^2} \times \left[G \times J + \frac{\pi^2 \times E \times C_w}{(Kt \times Lt)^2}\right] = \frac{1}{1.059(2.798)^2} \times \left[11{,}200 \times 0.004 + \frac{\pi^2 \times 29{,}000 \times 1.546}{(1 \times 78.74)^2}\right] = 14.37 \text{ ksi}$$

F^{crex} is the lesser of σ_x and σ_t ; $F^{crex} = 14.37\ ksi$

$$\lambda_{cz} = \sqrt{\frac{F_y}{F_{(crex)}}} = 1.583 > 1.5$$

$$F_{\text{nz}} = \frac{0.877}{\lambda_{\text{cz}}{}^2} \times F_y = \frac{0.877}{(1.583)^2} \times 36 = 12.60 \text{ ksi}$$

$$P_{nz} = A \times F_{\text{nz}} = 1.059 \times 12.60 = 13.34 \text{ kips}$$

Along Y axis:

$$\frac{K_y \times L_y}{r_y} = \frac{1 \times 78.74}{0.337} = 233.7$$

$$\sigma_y = \frac{\pi^2 \times E}{\left(\frac{K_y \times L_y}{r_y}\right)^2} = \frac{\pi^2 \times 29{,}000}{(233.7)^2} = 5.244 \text{ ksi}$$

F^{crey} is the lesser of σ_y and σ_t ; $F^{crey} = 5.244\ ksi$

$$\lambda_{\text{cy}} = \sqrt{\frac{F_y}{F_{(crey)}}} = 2.62 > 1.5$$

$$F_{\text{ny}} = \frac{0.877}{\lambda_{\text{cy}}{}^2} \times F_y = \frac{0.877}{(2.62)^2} \times 36 = 4.599 \text{ ksi}$$

$$P_{ny} = A \times F_{\text{nz}} = 1.059 \times 4.599 = 4.869 \text{ kips (Governs)}$$

Design nominal axial strength (LRFD):

$$P_{ny} \times \phi_c = 4.869 \times 0.85 = 4.140 \text{ kips}$$

Calculate Bending Strength

Major axis nominal moment capacity:

$$\mathrm{M_z} = \mathrm{S_z} \times \mathrm{F_y} = 1.97 \times 36 = 70.92 \text{ in} \cdot \text{kips}$$

Major axis ultimate moment capacity:

$$\phi_b M_z = 0.90 \times 70.92 = 63.83 \text{ in} \cdot \text{kip}$$

Minor axis nominal moment capacity:

$$\mathrm{M_y} = \mathrm{S_y} \times \mathrm{F_y} = 0.096 \times 36 = 3.456 \text{ in} \cdot \text{kips}$$

Minor axis ultimate moment capacity:

$$\phi_b M_y = 0.90 \times 3.456 = 3.110 \text{ in} \cdot \text{kip}$$

Lateral-Torsional Buckling Strength

$$\sigma_{\text{ey}} = \sigma_y = 5.244 \text{ ksi}$$

$$C_b = \frac{12.5 M_{\text{max}}}{2.5 M_{\text{max}} + 3M_A + 4M_B + 3M_C} = 1.136$$

For singly symmetric sections bent about the axis of symmetry:

$$F_{\text{crez}} = \frac{C_b r_0 A}{2 S_f} \sqrt{\sigma_{\text{ey}} \sigma_t} = \frac{1.136(2.749)(1.059)}{2(1.97)} \sqrt{5.244 \times 14.37} = 7.283 \text{ ksi}$$

where

S_f = the elastic section modulus for the unreduced section relative to the extreme compression fiber per AISI S100 2016. Hence, $S_f = S_z$.

For $F_{cre} < 0.56F_y = 0.56 \times 36 = 20.16, F_n = F_{crez}$.

$$M_{ne} = F_n \times S_f = 7.283 \times 1.97 = 14.35 \text{ in-k}$$

Design nominal lateral-torsional buckling strength (LRFD):

$$\phi_b M_{ne} = 0.9 \times 14.35 = 12.92 \text{ in·kips}$$

Table 834: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Ultimate axial strength (kips)	4.140	4.130	negligible	
Major axis bending strength (in·kips)	63.83	63.828	negligible	
Minor axis bending strength (in·kips)	3.110	3.110	none	
Lateral-torsional buckling strength (in·kips)	12.92	12.914	negligible

V. AISI 2016 ZS Compressive Strength

Verify the compressive strength of a cold-formed zee section with lips per the AISI S100 2016 specification.

Details

A 15' long, simply supported beam is subjected to a 10 kip axial load (compression). The section used is a 12ZS3.25x105, Grade 36 steel.

Section Properties

Taken from AISI Manual, Cold-Formed Steel Design - Vol. 1, 2017 Table I-1.

Area, $A_g = 2.09\ in^2$
Radius of gyration z axis, $r_z = 4.57\ in$
Radius of gyration y axis, $r_y = 1.49\ in$
Elastic section modulus y axis, $S_{fy} = 1.22\ in^3$
Elastic section modulus z axis, $S_{fz} = 7.29\ in^3$
Torsional constant, $J = 0.00769\ in^4$
Warping constant, $C_w = 123\ in^6$

Material Properties

$E = 29{,}000\ ksi$

G = 11,300 ksi
F_y = *36 ksi*

Validation

The elastic flexural buckling stress about the z axis:

$$F_{\text{crez1}} = \frac{\pi^2 E}{(K_z L_z / r_z)^2} = \frac{\pi^2 \times 29{,}000}{(1 \times 180 / 4.57)^2} = 184.5 \text{ ksi} \quad \text{(Eq. E2.1-1)}$$

Polar radius of gyration of cross-section about shear center:

$$r_o = \sqrt{r_z^2 + r_y^2} = 4.81 \text{ in} \quad \text{(Eq. E2.2-4)}$$

$$\sigma_t = \frac{1}{A_g r_o^2}\left[GJ + \frac{\pi^2 E C_w}{(K_t L_t)^2}\right] = \frac{1}{2.09 \times 4.81^2}\left[11{,}200 \times 0.00769 + \frac{\pi^2 \times 29{,}000 \times 123}{(1 \times 180)^2}\right] = 24.14 \text{ ksi} \quad \text{(Eq. E2.2-5)}$$

$$\sigma_{\text{ez}} = F_{\text{crez}} = 184.5 \text{ ksi} \quad \text{(Eq. E2.2-6)}$$

Per E2.3, the flexural-torsional buckling stress is the lesser of σ_{ez} and σ_t; so $F_{crez} = 24.14$ *ksi*

The compressive stress capacity is:

$$\lambda_{\text{cz}} = \sqrt{\frac{F_y}{F_{\text{cre}}}} = \sqrt{\frac{36}{24.14}} = 1.221 < 1.5 \quad \text{(Eq. E2-4)}$$

$$F_{\text{nz}} = \left(0.658^{\lambda_{\text{cz}}^2}\right) F_y = 0.658^{(1.221)^2} 36 = 19.28 \text{ ksi}$$

The elastic flexural buckling stress about the y axis:

$$F_{\text{crey1}} = \frac{\pi^2 E}{(K_y L_y / r_y)^2} = \frac{\pi^2 \times 29{,}000}{(1 \times 180 / 1.49)^2} = 19.61 \text{ ksi} \quad \text{(Eq. E2.1-1)}$$

The elastic global buckling stress about the z axis is the minimum of F_{crey1} and σ_t; so $F_{crey} = 19.61$ *ksi*.

$$\lambda_{\text{cy}} = \sqrt{\frac{F_y}{F_{\text{crey}}}} = \sqrt{\frac{36}{19.61}} = 1.355 < 1.5 \quad \text{(Eq. E2-4)}$$

$$F_{\text{ny}} = \left(0.658^{\lambda_{\text{cz}}^2}\right) F_y = 0.658^{(1.355)^2} 36 = 16.69 \text{ ksi} \quad \text{(Eq. E2-2)}$$

Global buckling about the Y axis governs.

Nominal capacity against global buckling:

$$P_n = A_g F_n = 2.09 \times 16.69 = 34.89 \text{ kips}$$

The available axial strength:

LRFD: $\phi_c P_n = 0.85 \times 34.89 = 29.66$ *kips*
ASD: P_n/Ω_c = 34.89 / 1.8 = 19.38 kips

Determine the compression capacity for local buckling interacting with yielding and global buckling as per E3:

For local buckling about the Z axis, the effective area, $A_e = 1.586\ in^2$.

$$P_{n\ell z} = A_e \times F_{nz} = 1.586 \times 19.28 = 30.56 \text{ kips}$$

For local buckling about the Y axis, the effective area, $A_e = 1.627\ in^2$.

$$P_{n\ell y} = A_e \times F_{nz} = 1.627 \times 16.69 = 27.15 \text{ kips}$$

$P_{n\ell}$ is taken as the minimum of $P_{n\ell z}$, $P_{n\ell y}$, and P_{ne}; so $P_{n\ell} = 27.15\ kips$.

LRFD: $\phi_c P_{n\ell} = 0.85 \times 27.15 = 23.08\ kips$
ASD: $P_{n\ell}/\Omega_c = 27.15 / 1.8 = 15.06$ kips

Determine the compression capacity for distortional buckling as per E4:

The elastic distortional buckling stress, $F^{crd} = 30.84\ ksi$.

The elastic distortional buckling load, $P_{crd} = A_g \times F^{crd} = 2.09 \times 30.84 = 64.46\ kips$.

$$P_y = A_g \times F^y = 2.09 \times 36 = 75.24 \text{ kips} \qquad \text{(Eq. E4.1-4)}$$

$$\lambda_d = \sqrt{\frac{P_y}{P_{crd}}} = \sqrt{\frac{75.24}{64.46}} = 1.08 > 0.561 \qquad \text{(Eq. E4.1-3)}$$

$$P_{nd} = \left[1 - 0.25\left(\frac{P_{crd}}{P_y}\right)^{0.6}\right]\left(\frac{P_{crd}}{P_y}\right)^{0.6} P_y \qquad \text{(Eq. 4.1-2)}$$

$$= \left[1 - 0.25\left(\frac{64.46}{75.24}\right)^{0.6}\right]\left(\frac{64.46}{75.24}\right)^{0.6} 75.24 = 52.95 \text{ ksi}$$

The available axial strength:

LRFD: $\phi_c P_{nd} = 0.85 \times 52.95 = 45.01\ kips$
ASD: $P_{nd}/\Omega_c = 52.95 / 1.8 = 29.42$ kips

Results

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Local compression capacity (kips)	23.08	23.212	negligible	
	Distorional buckling capacity (kips)	45.01	45.006	negligible	
	Axial compression capacity (kips)	29.66	29.809	negligible	
ASD	Local compression capacity (kips)	15.06	15.171	negligible	
	Distorional buckling capacity (kips)	29.42	29.416	negligible	

Result Type		Reference	STAAD.Pro	Difference	Comments
	Axial compression capacity (kips)	19.38	19.483	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISI\AISI 2016 ZS Compressive Strength.STD` is typically installed with the program.

V. AISI 2016 ZS Flexural Strength

Verify the flexural strength in yielding of a cold-formed zee section according to the AISI S100 2016 specification using both the LRFD and ASD methods.

Details

A 1.5' long, simply supported beam is subjected to a uniform load in the global Y direction. The section used is a 12ZS3.25x105, Gr. 50 steel.

Section Properties

Taken from AISI Manual, Cold-Formed Steel Design - Vol. 1, 2017 Table I-1.

Area, $A_g = 2.09\ in^2$
Radius of gyration z axis, $r_z = 4.57\ in$
Radius of gyration y axis, $r_y = 1.49\ in$
Elastic section modulus y axis, $S_{fy} = 1.22\ in^3$
Elastic section modulus z axis, $S_{fz} = 7.29\ in^3$
Torsional constant, $J = 0.00769\ in^4$
Warping constant, $C_w = 123\ in^6$

Material Properties

$E = 29{,}000\ ksi$
$G = 11{,}300\ ksi$
$F_y = 50\ ksi$

Validation

The modification factor, C_b, for a simply-supported beam under a uniformly distributed load:

$$C_b = \frac{12.5 \times M_{\mathrm{max}}}{2.5 \times M_{\mathrm{max}} + 3 \times M_{\mathrm{a}} + 4 \times M_{\mathrm{b}} + 3 \times M_{\mathrm{c}}} = 1.14 \qquad \text{(Eq. F2.1.1-2)}$$

Polar radius of gyration of cross-section about shear center:

$$r_o = \sqrt{{r_z}^2 + {r_y}^2} = 4.81 \text{ in} \qquad \text{(Eq. F2.1.1-3)}$$

Major axis bending:

$$\sigma_{\mathrm{ey}} = \frac{\pi^2 E}{(K_y L_y / r_y)^2} = \frac{\pi^2 \times 29{,}000}{(1 \times 18 / 1.49)^2} = 1{,}961 \text{ ksi} \qquad \text{(Eq. F2.1.1-4)}$$

$$\sigma_t = \frac{1}{A{r_o}^2}\left[GJ + \frac{\pi^2 E C_w}{(K_t L_t)^2}\right] = \frac{1}{2.09 \times 4.81^2}\left[11{,}200 \times 0.00769 + \frac{\pi^2 \times 29{,}000 \times 123}{(1 \times 18)^2}\right] = 2{,}249 \text{ ksi} \qquad \text{(Eq. F2.1.1-5)}$$

$$F_{\mathrm{cre}} = \frac{C_b r_o A}{2S_f}\sqrt{\sigma_{\mathrm{ey}} \times \sigma_t} = \frac{1.14 \times 4.81 \times 2.09}{2 \times 7.29}\sqrt{1{,}961 \times 2{,}249} = 1{,}651 \text{ ksi} \qquad \text{(Eq. F2.1.1-1)}$$

Per F2.1, where $F_{cre} > 2.78F_y = 2.78(50) = 139\ ksi$, $F_n = F_y$ (Eq. F2.1-3).

Nominal capacity against lateral-torsional buckling about the major axis:

$$\mathrm{M_{nez} = S_{fz}F_n} = 7.29 \times 50 = 364.5 \text{ in·kips}$$

The available flexural strength about the major axis:

LRFD: $\phi_b M_{nez} = 0.9 \times 364.5 = 328.1\ in{\cdot}kips$
ASD: M_{nez}/Ω_b = 364.5 / 1.67 = 218.3 in·kips

Minor axis bending:

$$F_{\mathrm{cre}} = \frac{C_b r_o A}{2S_f}\sqrt{\sigma_{\mathrm{ey}} \times \sigma_t} = \frac{1.14 \times 4.81 \times 2.09}{2 \times 7.29}\sqrt{1{,}961 \times 2{,}249} = 1{,}651 \text{ ksi} \qquad \text{(Eq. F2.1.1-1)}$$

Per F2.1, where $F_{cre} > 2.78F_y = 2.78(50) = 139\ ksi$, $F_{ny} = F_y$ (Eq. F2.1-3).

Elastic section modulus of full unreduced cross-section relative to extreme fiber in first yielding: $S_{fyy} = S_{fy}$.

Nominal capacity against lateral-torsional buckling about the major axis:

$$M_{ney} = S_{fy}F_n = 1.22 \times 50 = 61.0 \text{ in·kips}$$

The available flexural strength about the major axis:

LRFD: $\phi_b M_{ney} = 0.9 \times 61.0 = 54.9\ in \cdot kips$
ASD: $M_{ney}/\Omega_b = 61.0 / 1.67 = 36.5$ in·kips

Results

Result Type		Reference	STAAD.Pro	Difference	Comments
LRFD	Flexural capacity about major axis (in·kips)	328.1	327.750	negligible	
	Flexural capacity about minor axis (in·kips)	54.9	54.074	negligible	
ASD	Flexural capacity about major axis (in·kips)	218.3	218.064	negligible	
	Flexural capacity about minor axis (in·kips)	36.5	35.977	negligible	

STAAD.Pro Input

The file `C:\Users\Public\Public Documents\STAAD.Pro CONNECT Edition\Samples\Verification Models\09 Steel Design\US\AISI\AISI 2016 ZS Flexural Strength.STD` is typically installed with the program.

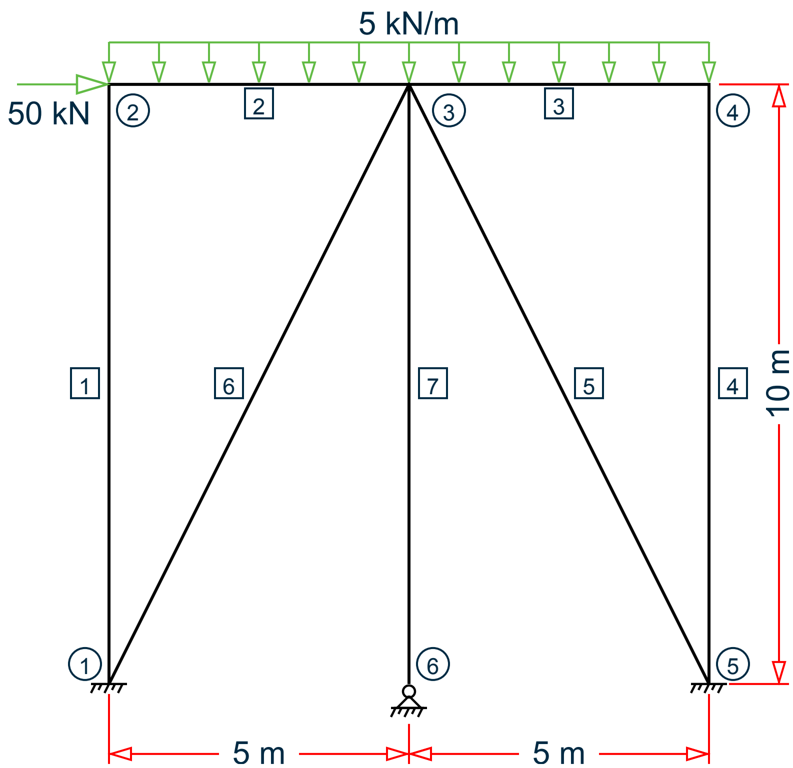
V. API

V.API K Joint

Verify the design of a simple K joint with axial load and in-plane bending.

Details

Design of node 3 in the following model.



Chord member (2 & 3): D = 500 mm, T = 20 mm (A_c = 30,159 mm^2, Z_c = 3,480,380 mm^3)

Brace member (5 & 7): d = 400 mm, t = 20 mm (A_b = 23,876 mm^2, Z_b = 2,160,790 mm^3)

Table 835: Loads

Member	Fx (kN)	MIP (kN·m)	MOP (kN·m)
Chord	49.99 (T)	17.58	0
Brace	72.51 (C)	0.727	0

Validation

Design Parameters

$$\beta = d/D = 0.8$$

So, $0.2 < \beta < 1.0$ (OK)

$$\gamma = D/2T = 12.5$$

So, $10 < \gamma < 50$ (OK)

$$\theta = \tan^{-1}(10/5) = 63.4°$$

So, $30° < \theta < 90°$ (OK)

$F_y = 500\ MPa$ (OK)

$$g = 20 \text{ mm}$$

$g/D = 20 / 500 = 0.04$

<u>Determination of Q_u</u>

First, evaluate Q_g. Since $-0.05 \le g/D \le 0.05$, use linear interpolation.

For $g/D = 0.05$: $Q_g = 1 + 0.2\times(1 - 2.8\times g/D)^3 = 1 + 0.2\times[1 - 2.8\times(0.05)]^3 = 1.127$

For $g/D = -0.05$: $Q_g = 0.13 + 0.65\times\phi\times\gamma^{0.5} = 0.13 + 0.65\times(1)\times(12.5)^{0.5} = 2.428$

For $g/D = 0.04$: $1.127 + (2.428 - 1.127)\times(0.05 - 0.04) / (0.05 - -0.05) = 1.257$

$$Q_{u\_ax} = (16 + 1.2\times\gamma)\times\beta^{1.2}\times Q_g = [16 + 1.2(12.5)](0.8)^{1.2}(1.257) = 29.815$$

$$Q_{u\_ipb} = (5 + 0.7\times\gamma)\times\beta^{1.2} = [5 + 0.7(12.5)](0.8)^{1.2} = 10.52$$

<u>Determination of Q_f</u>

From Table 4.3.2:

$C1_{ax} = 0.2$, $C2_{axi} = 0.2$, $C3_{ax} = 0.3$

$C1_b = 0.2$, $C2_b = 0$, $C3_b = 0.4$

$$P_{yc} = A_c\times F_{yc} = 15{,}079.5 \text{ kN}$$

$$M_{pc} = Z_c\times F_{yc} = 1{,}740.19 \text{ kN}\cdot\text{m}$$

$$P_c = 49.99 \text{ kN}$$

$$M_c = \sqrt{(MIPC^2+MOPC^2)} = 17.58 \text{ kN}\cdot\text{m}$$

$$A = \sqrt{\left(\frac{FS \times P_c}{P_{yc}}\right)^2 + \left(\frac{FS \times M_c}{M_{pc}}\right)^2} = \sqrt{\left(\frac{1.6 \times 49.99}{17,\ 079.5}\right)^2 + \left(\frac{1.6 \times 17.58}{1,\ 740.19}\right)^2} = 0.017$$

$$Q_{f\_\text{ax}} = 1 + C1_{ax}\left(\frac{FS \times P_c}{P_{yc}}\right) - C2_{ax}\left(\frac{FS \times M_c}{M_{pc}}\right) - C3_{ax}A^2$$

$$Q_{f\_\text{ax}} = 1 + 0.2\left(\frac{1.6 \times 49.99}{15,\ 079.5}\right) - 0.2\left(\frac{1.6 \times 17.58}{1,\ 740.19}\right) - 0.3(0.017)^2 = 0.9977$$

$$Q_{f\_\text{bend}} = 1 + C1_b\left(\frac{FS \times P_c}{P_{yc}}\right) - C2_b\left(\frac{FS \times M_c}{M_{pc}}\right) - C3_bA^2$$

$$Q_{f\_\text{bend}} = 1 + 0.2\left(\frac{1.6 \times 49.99}{15,\ 079.5}\right) - 0 - 0.4(0.017)^2 = 1.001$$

<u>Axial Capacity</u>

$$P_a = Q_uQ_f\frac{F_{yc}T^2}{FS\sin\theta} = 29.815(0.9977)\frac{500(20)^2}{1.6\sin\left(63.4^\circ\right)10^3} = 4,\ 158.5 \text{ kN}$$

<u>Moment Capacity</u>

$$M_a = Q_uQ_f\frac{F_{yc}T^2d}{FS\sin\theta} = 10.52(1.001)\frac{500(20)^2 400}{1.6\sin\left(63.4^\circ\right)10^6} = 588.85 \text{ kN}\cdot\text{m}$$

Out-of-plane bending is zero so moment capacity is not calculated.

<u>Interaction Ratio</u>

$$P/P_a + (M/M_a)^2 = (72.511 / 4{,}158.5) + (0.727 / 588.85)^2 = 0.017$$

Results

Table 836: Comparison of results

Result Type	Reference	STAAD.Pro	Difference	Comments
Q_{u_ax}	29.815	29.824	negligible	
Q_{u_ipb}	10.52	10.523	negligible

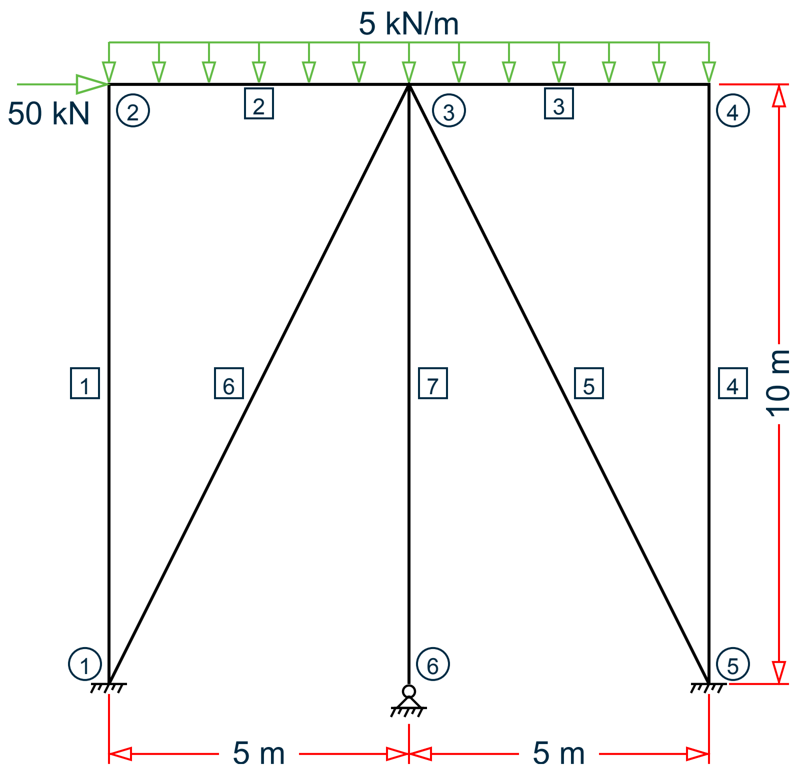
V.API Overlapping KJoint - Comp and Bend

Verify the design of an overlapping K joint with axial load, in-plane bending, and out-of-plane bending.

Details

Design of node 3 in the following model.



Chord member (2 & 3): D = 500 mm, T = 20 mm (A_c = 30,159 mm^2, Z_c = 3,480,380 mm^3)

Brace member (5 & 7): d = 400 mm, t = 20 mm (A_b = 23,876 mm^2, Z_b = 2,160,790 mm^3)

Table 837: Loads

Member	Fx (kN)	MIP (kN·m)	MOP (kN·m)
Chord	49.99 (T)	17.58	4.96
Brace	72.51 (C)	0.727	6.254

Validation

<u>Design Parameters</u>

$$\beta = d/D = 0.8$$

So, $0.2 < \beta < 1.0$ (OK)

$$\gamma = D/2T = 12.5$$

So, $10 < \gamma < 50$ (OK)

$$\theta = \tan^{-1}(10/5) = 63.4°$$

So, $30° < \theta < 90°$ (OK)

$F_y = 500\ MPa$ (OK)

$$g = -76.2\text{ mm}$$

$g/D = -76.2 / 500 = -0.1524$

<u>Determination of Q_u</u>

First, evaluate Q_g. Since $g/D < -0.50$, use linear interpolation.

For $g/D = -0.05$: $Q_g = 0.13 + 0.65 \times \phi \times \gamma^{0.5} = 0.13 + 0.65 \times (1) \times (12.5)^{0.5} = 2.428$

$$Q_{u\_ax} = (16 + 1.2 \times \gamma) \times \beta^{1.2} \times Q_g = [16 + 1.2(12.5)](0.8)^{1.2}(2.428) = 57.586$$

$$Q_{u\_ipb} = (5 + 0.7 \times \gamma) \times \beta^{1.2} = [5 + 0.7(12.5)](0.8)^{1.2} = 10.52$$

$$Q_{u\_opb} = 2.5 + (4.5 + 0.2 \times \gamma) \times \beta^{2.6} = 2.5 + [4.5 + 0.2(12.5)](0.8)^{2.6} = 6.419$$

<u>Determination of Q_f</u>

From Table 4.3.2:

$C1_{ax} = 0.2$, $C2_{axi} = 0.2$, $C3_{ax} = 0.3$

$C1_{ipb} = 0.2$, $C2_{ipb} = 0$, $C3_{ipb} = 0.4$

$C1_{opb} = 0.2$, $C2_{opb} = 0$, $C3_{opb} = 0.4$

$$P_{yc} = A_c \times F_{yc} = 15{,}079.5 \text{ kN}$$

$$M_{pc} = Z_c \times F_{yc} = 1{,}740.19 \text{ kN} \cdot \text{m}$$

$$P_c = 49.99 \text{ KN}$$

$$M_c = \sqrt{(MIPC^2 + MOPC^2)} = 18.267 \text{ kN} \cdot \text{m}$$

$$A = \sqrt{\left(\frac{FS \times P_c}{P_{yc}}\right)^2 + \left(\frac{FS \times M_c}{M_{pc}}\right)^2} = \sqrt{\left(\frac{1.6 \times 49.99}{17,\ 079.5}\right)^2 + \left(\frac{1.6 \times 18.267}{1,\ 740.19}\right)^2} = 0.0176$$

$$Q_{f\_ax} = 1 + C1_{ax}\left(\frac{FS \times P_c}{P_{yc}}\right) - C2_{ax}\left(\frac{FS \times M_c}{M_{pc}}\right) - C3_{ax}A^2$$

$$Q_{f\_ax} = 1 + 0.2\left(\frac{1.6 \times 49.99}{15,\ 079.5}\right) - 0.2\left(\frac{1.6 \times 18.267}{1,\ 740.19}\right) - 0.3(0.0176)^2 = 0.9989$$

$$Q_{\text{f\_ipb}} = 1 + \text{C1}_{\text{ipb}}\left(\frac{FS \times P_c}{P_{yc}}\right) - \text{C2}_{\text{ipb}}\left(\frac{FS \times M_c}{M_{pc}}\right) - \text{C3}_{\text{ipb}}A^2$$

$$Q_{\text{f\_ipb}} = 1 + 0.2\left(\frac{1.6 \times 49.99}{15,\ 079.5}\right) - 0 - 0.4(0.0176)^2 = 1.001$$

$$Q_{\text{f\_opb}} = 1 + \text{C1}_{\text{opb}}\left(\frac{FS \times P_c}{P_{yc}}\right) - \text{C2}_{\text{opb}}\left(\frac{FS \times M_c}{M_{pc}}\right) - \text{C3}_{\text{opb}}A^2$$

$$Q_{\text{f\_ipb}} = 1 + 0.2\left(\frac{1.6 \times 49.99}{15,\ 079.5}\right) - 0 - 0.4(0.0176)^2 = 1.001$$

<u>Axial Capacity</u>

$$P_a = Q_u Q_f \frac{F_{yc}T^2}{FS\sin\theta} = 57.586(0.9977)\frac{500(20)^2}{1.6\sin(63.4\circ)10^3} = 8,\ 041.5 \text{ kN}$$

<u>Moment Capacity</u>

In-plane bending:

$$M_a = Q_u Q_f \frac{F_{yc}T^2 d}{FS\sin\theta} = 10.52(1.001)\frac{500(20)^2 400}{1.6\sin(63.4\circ)10^6} = 588.85 \text{ kN} \cdot \text{m}$$

Out-of-plane bending:

$$M_a = Q_u Q_f \frac{F_{yc} T^2 d}{FS \sin\theta} = 6.419(1.001)\frac{500(20)^2 400}{1.6\sin\left(63.4^\circ\right)10^6} = 359.31 \text{ kN·m}$$

<u>Brace Loads</u>

As axial loads for through and overlapping brace are of different sign, resultant axial load will be that of through brace. (Page 65, API code).

Axial load = 72.511 kN (C)

According to Page 65 of the API code, the resultant in-plane and out-plane bending moments will be algebraic summation of moments of the through brace and overlapping brace.

In-plane moment = 0.727 + (-0.89) = -0.163 kN·m

Out-of-plane moment = 6.254 + 6.254 = 12.508 kN·m

<u>Interaction Ratio</u>

$P/P_a + (M/M_a)_{ip}^2 + (M/M_a)_{op} = (72.511 / 8{,}014.5) + (0.163 / 588.85)^2 + (12.508 / 359.31) = 0.044$

Results

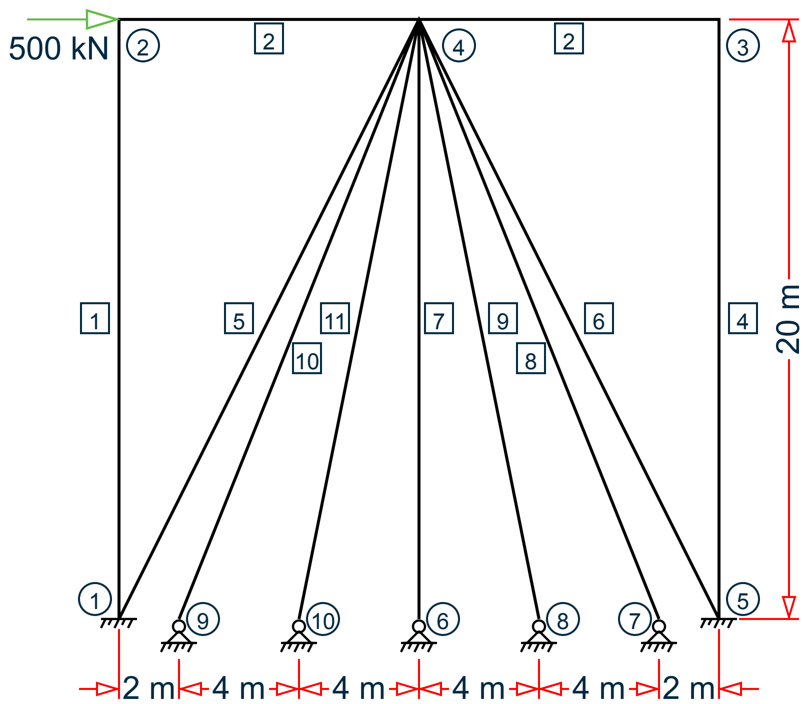
Details

Design of node 4 (between members 2 and 5) in the following model.



Chord member (2): D = 20 in, T = 1 in (A_c = 59.69 in^2, Z_c = 361.3 in^3)

Brace member (5): d = 18 in, t = 1 in (A_b = 53.41^2, Z_b = 289.3^3)

Brace member 10 overlaps with member 5.

Table 839: Loads

Member	Fx (kN)	MIP (kN·m)	MOP (kN·m)
Chord	499.21 (C)	268.18	0
Brace	322.34 (T)	101.72	0

Validation

Design Parameters

$$\beta = d/D = 0.9$$

So, $0.2 < \beta < 1.0$ (OK)

$$\gamma = D/2T = 10$$

So, $10 < \gamma < 50$ (OK)

$$\theta = \tan^{-1}(10/5) = 63.4°$$

So, $30° < \theta < 90°$ (OK)

$F_y = 50\ ksi$ (OK)

$$g = -4 \text{ mm}$$

$g/D = -4 / 20 = -0.2$

Determination of Q_u

First, evaluate Q_g:

For $g/D < -0.05$: $Q_g = 0.13 + 0.65 \times \phi \times \gamma^{0.5} = 0.13 + 0.65 \times (1) \times (10)^{0.5} = 2.185$

$$Q_{u\_ax} = (16 + 1.2 \times \gamma) \times \beta^{1.2} \times Q_g = [16 + 1.2(10)](0.9)^{1.2}(2.185) = 53.914$$

$$Q_{u\_ipb} = (5 + 0.7 \times \gamma) \times \beta^{1.2} = [5 + 0.7(10)](0.9)^{1.2} = 10.575$$

Determination of Q_f

From Table 4.3.2:

$C1_{ax} = 0.2$, $C2_{axi} = 0.2$, $C3_{ax} = 0.3$

$C1_b = 0.2$, $C2_b = 0$, $C3_b = 0.4$

$$P_{yc} = A_c \times F_{yc} = 2{,}984.5 \text{ kips}$$

$$M_{pc} = Z_c \times F_{yc} = 18{,}067 \text{ in·k}$$

$$P_c = -499.21 \text{ kips}$$

$$M_c = \sqrt{(MIPC^2 + MOPC^2)} = 268.18 \text{ in·k}$$

$$A = \sqrt{\left(\frac{FS \times P_c}{P_{yc}}\right)^2 + \left(\frac{FS \times M_c}{M_{pc}}\right)^2} = \sqrt{\left(\frac{2 \times 499.21}{2,\ 984.5}\right)^2 + \left(\frac{2 \times 268.18}{18,\ 067}\right)^2} = 0.3359$$

$$Q_{f\_ax} = 1 + C1_{ax}\left(\frac{FS \times P_c}{P_{yc}}\right) - C2_{ax}\left(\frac{FS \times M_c}{M_{pc}}\right) - C3_{ax}A^2$$

$$Q_{f\_ax} = 1 + 0.2\left(\frac{2 \times 499.21}{2,\ 984.5}\right) - 0.2\left(\frac{2 \times 268.18}{18,\ 067}\right) - 0.3(0.3359)^2 = 0.893$$

$$Q_{f\_bend} = 1 + C1_b\left(\frac{FS \times P_c}{P_{yc}}\right) - C2_b\left(\frac{FS \times M_c}{M_{pc}}\right) - C3_bA^2$$

$$Q_{f\_ax} = 1 + 0.2\left(\frac{2 \times 499.21}{2,\ 984.5}\right) - 0 - 0.4(0.3359)^2 = 0.888$$

Axial Capacity

$$P_a = Q_u Q_f \frac{F_{yc}T^2}{FS\sin\theta} = 53.914(0.893)\frac{50(1)^2}{2\sin\left(63.4\,°\right)10^3} = 1,\ 346.1 \text{ kips}$$

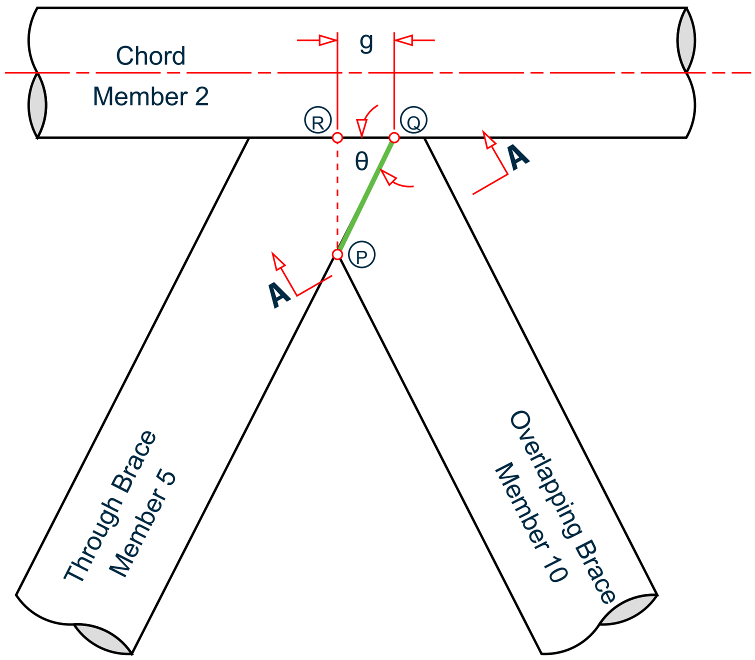
Moment Capacity

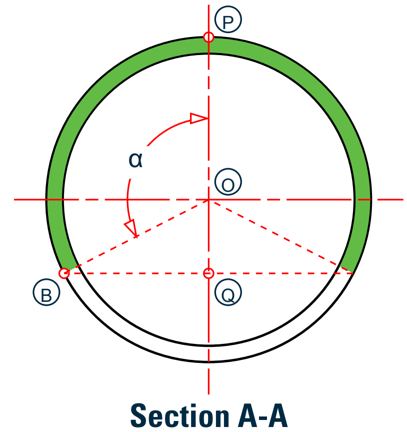
$$M_a = Q_u Q_f \frac{F_{yc}T^2 d}{FS\sin\theta} = 10.52(1.001)\frac{50(1)^2 18}{2\sin\left(63.4\,°\right)10^6} = 4,\ 726 \text{ in·k}$$

Out-of-plane bending is zero so moment capacity is not calculated.

Brace Loads

As axial loads for through and overlapping braces are of different signs, the resultant axial load will be the sum of both brace loads (reference p.65).





The gap distance, $g = 4\ in$ (segment QR).

Angle PQR = $\theta = 63.4°$

The loaded segment length (green line PQ) = $g / cos(\theta) = 4 / cos(63.4°) = 8.93\ in$

To determine the overlapping portion of the cross section of member 10 (i.e., the green portion of Section A-A), node that line segments OP and OB are equal to the radius of the pipe (use the nominal outer radius), $r = 6\ in$.

$$\cos(\alpha) = (r - PQ)/r = (6 - 8.93) / 6 = -0.489$$

$$\alpha = 119.3° = 2.082 \text{ rad}$$

The arc length (green portion of Section A-A) = $2 \times \alpha \times r = 2(2.082)(6) = 25\ in$

The proportion of this arc to the total circumference = $25\ /\ (2\pi \times r) = 25\ /\ (2\pi \times 6) = 0.663$

So the total axial load is the axial load of the through brace plus this ratio times the axial load of the overlapping brace (axial force values taken from STAAD.Pro post-processing workflow):

$$322.39 \text{ kip} + 0.663 \times 181.5 \text{ kip} = 442.7 \text{ kip}$$

According to p.65 of the API code, the resultant in-plane and out-plane bending moments will be algebraic summation of moments of the through brace and overlapping brace. Therefore, the total in-plane moment:

$$101.72 \text{ in·k} + 12.61 \text{ in·k} = 114.33 \text{ in·k}$$

Interaction Ratio

$$P/P_a + (M/M_a)^2 = (442.7 / 1{,}346.1) + (114.33 / 4{,}726)^2 = 0.329$$

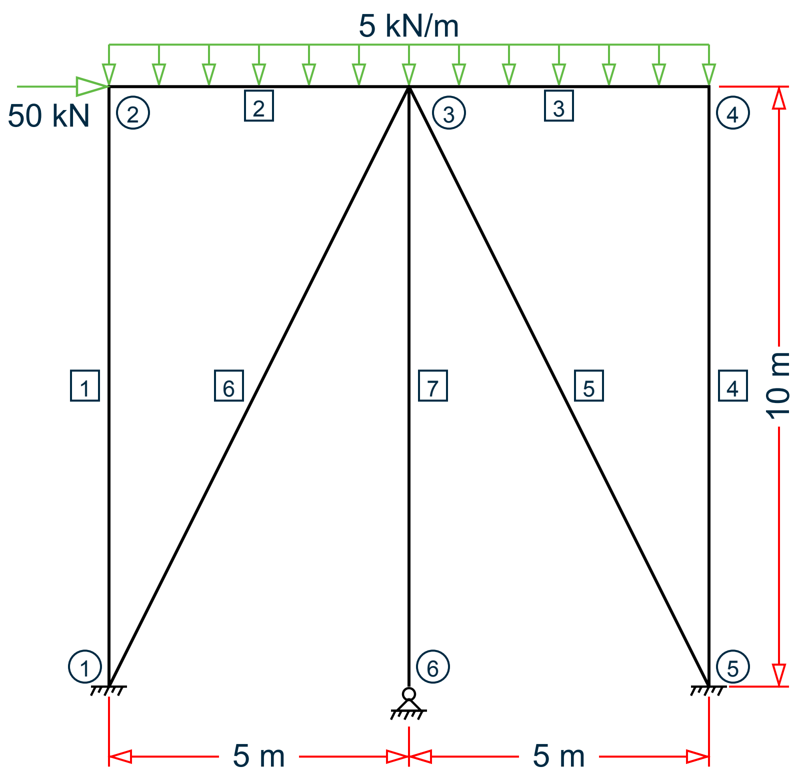
V.API X Joint

Verify the design of a simple X joint with axial load and in-plane bending.

Details

Design of node 3 between members 2 and 6 in the following model.



Chord member (2 & 3): D = 500 mm, T = 20 mm (A_c = 30,159 mm^2, Z_c = 3,480,380 mm^3)

Brace member (6): d = 475 mm, t = 15 mm (A_b = 21,677 mm^2, Z_b = 2,416,700 mm^3)

Table 841: Loads

Member	Fx (kN)	MIP (kN·m)	MOP (kN·m)
Chord	49.99 (T)	17.34	4.97
Brace	66.082 (C)	0.921	6.255

Validation

Design Parameters

$$\beta = d/D = 0.95$$

So, $0.2 < \beta < 1.0$ (OK)

$$\gamma = D/2T = 12.5$$

So, $10 < \gamma < 50$ (OK)

$$\theta = \tan^{-1}(10/5) = 63.4°$$

So, $30° < \theta < 90°$ (OK)

$F_y = 500\ MPa$ (OK)

Determination of Q_u

$$Q_\beta = 0.3/[\beta(1 - 0.833\times\beta)] = 1.513$$

$$Q_{u\_ax} = [2.8 + (12 + 0.1\times\gamma)\times\beta]\times Q_\beta = [2.8 + (12 + 0.1\times12.5)\times0.95](1.513) = 23.289$$

$$Q_{u\_ipb} = (5 + 0.7\times\gamma)\times\beta^{1.2} = [5 + 0.7(12.5)](0.95)^{1.2} = 12.929$$

$$Q_{u\_opb} = 2.5 + (4.5 + 0.2\times\gamma)\times\beta^{2.6} = 2.5 + [4.5 + 0.2(12.5)](0.95)^{2.6} = 8.626$$

Determination of Q_f

From Table 4.3.2:

$C1_{ax} = 0.2$, $C2_{axi} = 0$, $C3_{ax} = 0.35$

For C1, C2, and C3, interpolate between values for β ≤ 0.9 and β = 1.0.

$C1_b = 0.2$, $C2_b = 0$, $C3_b = 0.4$

$$P_{yc} = A_c\times F_{yc} = 15{,}079.5 \text{ kN}$$

$$M_{pc} = Z_c\times F_{yc} = 1{,}740.19 \text{ kN·m}$$

$$P_c = 49.99 \text{ kN}$$

$$M_c = \sqrt{(MIPC^2+MOPC^2)} = 18.04 \text{ kN·m}$$

$$A = \sqrt{\left(\frac{FS \times P_c}{P_{yc}}\right)^2 + \left(\frac{FS \times M_c}{M_{pc}}\right)^2} = \sqrt{\left(\frac{1.6 \times 49.99}{17,\ 079.5}\right)^2 + \left(\frac{1.6 \times 18.04}{1,\ 740.19}\right)^2} = 0.0174$$

$$Q_{f\_ax} = 1 + C1_{ax}\left(\frac{FS \times P_c}{P_{yc}}\right) - C2_{ax}\left(\frac{FS \times M_c}{M_{pc}}\right) - C3_{ax}A^2$$

$$Q_{f\_ax} = 1 + 0.2\left(\frac{1.6 \times 49.99}{15,\ 079.5}\right) - 0 - 0.35(0.0174)^2 = 1.0$$

$$Q_{f\_\text{ipb}} = 1 + C1_b\left(\frac{FS \times P_c}{P_{yc}}\right) - C2_b\left(\frac{FS \times M_c}{M_{pc}}\right) - C3_b A^2$$

$$Q_{f\_\text{ipb}} = 1 + 0.2\left(\frac{1.6 \times 49.99}{15,\ 079.5}\right) - 0 - 0.4(0.0174)^2 = 1.001$$

$$Q_{f\_\text{opb}} = 1 + C1_b\left(\frac{FS \times P_c}{P_{yc}}\right) - C2_b\left(\frac{FS \times M_c}{M_{pc}}\right) - C3_b A^2$$

$$Q_{f\_\text{opb}} = 1 + 0.2\left(\frac{1.6 \times 49.99}{15,\ 079.5}\right) - 0 - 0.4(0.0174)^2 = 1.001$$

Axial Capacity

$$P_a = Q_u Q_f \frac{F_{yc} T^2}{FS \sin\theta} = 23.289(1.0)\frac{500(20)^2}{1.6\sin\left(63.4\,^\circ\right)10^3} = 3,\ 255.7\ \text{kN}$$

Moment Capacity

In-plane bending:

$$M_a = Q_u Q_f \frac{F_{yc} T^2 d}{FS \sin\theta} = 12.929(1.001)\frac{500(20)^2 475}{1.6\sin\left(63.4\,^\circ\right)10^6} = 858.53\ \text{kN}\cdot\text{m}$$

Out-of-plane bending:

$$M_a = Q_u Q_f \frac{F_{yc} T^2 d}{FS \sin\theta} = 8.626(1.001)\frac{500(20)^2 475}{1.6\sin\left(63.4\,^\circ\right)10^6} = 572.8\ \text{kN}\cdot\text{m}$$

Interaction Ratio

$P/P_a + (M/M_a)_{ipb}^2 + (M/M_a)_{opb} = (66.082 / 3{,}255.7) + (0.921 / 858.53)^2 + (6.255 / 572.8) = 0.031$

Results

Table 842: Comparison of results

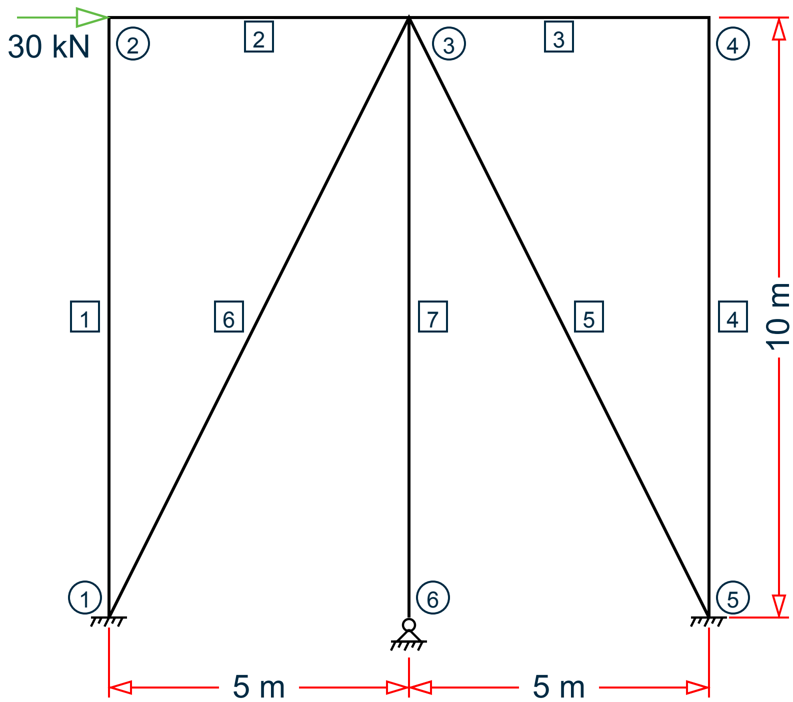
V.API Y Joint

Verify the design of a simple Y joint with axial load and in-plane bending.

Details

Consider the Y joint at node 3 between members 2 and 6.



Chord member (2 & 3): D = 500 mm, T = 20 mm (A_c = 30,159 mm^2, Z_c = 3,480,380 mm^3)

Brace member (5 & 7): d = 400 mm, t = 20 mm (A_b = 23,876 mm^2, Z_b = 2,160,790 mm^3)

Table 843: Loads

Member	Fx (kN)	MIP (kN·m)	MOP (kN·m)
Chord	30 (C)	0.49	0
Brace	33.34 (T)	0.485	0

Validation

Design Parameters

$$\beta = d/D = 0.8$$

So, $0.2 < \beta < 1.0$ (OK)

$$\gamma = D/2T = 12.5$$

So, $10 < \gamma < 50$ (OK)

$$\theta = \tan^{-1}(10/5) = 63.4°$$

So, $30° < \theta < 90°$ (OK)

$F_y = 500\ MPa$ (OK)

$$g = 0$$

Determination of Q_u

$$Q_{u\_ax} = 30\times\beta = 30(0.8) = 24$$

$$Q_{u\_ipb} = (5 + 0.7\times\gamma)\times\beta^{1.2} = [5 + 0.7(12.5)](0.8)^{1.2} = 10.52$$

Determination of Q_f

From Table 4.3.2:

$C1_{ax} = 0.3$, $C2_{axi} = 0$, $C3_{ax} = 0.8$

$C1_b = 0.2$, $C2_b = 0$, $C3_b = 0.4$

$$P_{yc} = A_c\times F_{yc} = 15{,}079.5\ kN$$

$$M_{pc} = Z_c\times F_{yc} = 1{,}740.19\ kN\cdot m$$

$$P_c = -30\ kN$$

$$M_c = \sqrt{(MIPC^2+MOPC^2)} = 0.49\ kN\cdot m$$

$$A = \sqrt{\left(\frac{FS\times P_c}{P_{yc}}\right)^2 + \left(\frac{FS\times M_c}{M_{pc}}\right)^2} = \sqrt{\left(\frac{1.6\times 30}{17,\ 079.5}\right)^2 + \left(\frac{1.6\times 0.49}{1,\ 740.19}\right)^2} = 0.003$$

$$Q_{f\_\text{ax}} = 1 + C1_{ax}\left(\frac{FS\times P_c}{P_{yc}}\right) - C2_{ax}\left(\frac{FS\times M_c}{M_{pc}}\right) - C3_{ax}A^2$$

$$Q_{f\_\text{ax}} = 1 + 0.3\left(\frac{1.6\times 30}{15,\ 079.5}\right) - 0 - 0.8(0.003)^2 = 0.999$$

$$Q_{f\_\text{bend}} = 1 + C1_b\left(\frac{FS\times P_c}{P_{yc}}\right) - C2_b\left(\frac{FS\times M_c}{M_{pc}}\right) - C3_bA^2$$

$$Q_{f\_\mathrm{bend}} = 1 + 0.2\left(\frac{1.6 \times 30}{15,\ 079.5}\right) - 0 - 0.4(0.003)^2 = 0.999$$

Axial Capacity

$$P_a = Q_u Q_f \frac{F_{yc} T^2}{FS \sin\theta} = 24(0.999)\frac{500(20)^2}{1.6\sin\left(63.4\,^\circ\right)10^3} = 3,\ 351.8\ \mathrm{kN}$$

Moment Capacity

$$M_a = Q_u Q_f \frac{F_{yc} T^2 d}{FS \sin\theta} = 10.52(0.999)\frac{500(20)^2 400}{1.6\sin\left(63.4\,^\circ\right)10^6} = 587.9\ \mathrm{kN{\cdot}m}$$

Out-of-plane bending is zero so moment capacity is not calculated.

Interaction Ratio

$$P/P_a + (M/M_a)^2 = (33.34 / 3{,}351.8) + (0.49 / 587.9)^2 = 0.010$$

Results

V. ASME NF 3000 Codes

V. ASME NF 3000 1974 Angle

Verify the allowable stress and critical ratio of the brace members in a frame using the ASME NF 3000 1974 code.

Details

The forces due to loading in member 6 is 2,666.18 lbs (tension) and in member 7 is 7,104.23 lbs (compression). Members 6 and 7 are “truss” members (axial-only).

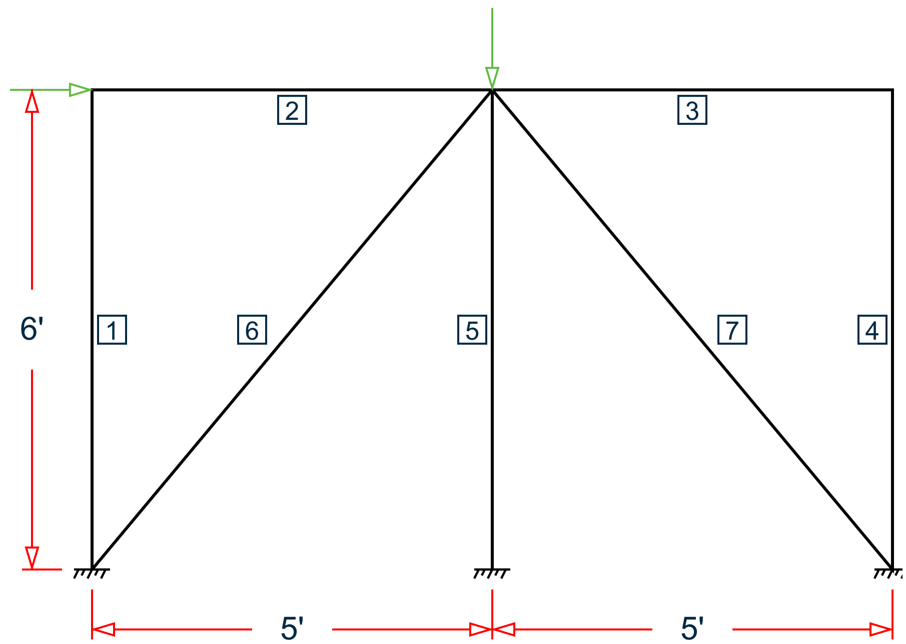

Figure 506: Space frame subjected to static loads

Both member 6 and 7 are L 80x60x10, grade A36 steel (F_y = *36 ksi*, F_u = *58 ksi*).

Assume a net section factor of 0.9, an effective length factor of 0.85, and C_t = 0.9.

Validation

$$L = \sqrt{5^2 + 6^2}(12\text{in/ft}) = 93.726\text{in}$$

Slenderness ratio (same for both members) using the minimum value of r: $kL/r_z = 0.85(93.726)/1.29 = 61.76$

For member 6, $kL/r_z = 61.76 < 300$

For member 7, $kL/r_z = 61.76 < 200$

Axial Tension: Member 6 (per NF-74.2211)

Corrected area, $A_c = C_t \times A_x = 7.57\ in^2$

Actual tensile stress = $P/A = 2{,}666.18\ /\ 7.57 = 352.2\ psi$

Allowable tensile stress (Tension capacity) = $0.6 \times Fy = 0.6 \times 36 = 21.6\ ksi$

Critical ratio = 352.2/21,600 = 0.016

Axial Compression: Member 7 (NF-74.2213):

Actual compressive stress = $P/A = 7{,}104.23\ /\ 8.41 = 844.74\ psi$

$$C_c' = \sqrt{\frac{2\pi^2 E}{Q_s Q_a F_y}} = 126.2 \qquad \text{(NF-3322.2(e)(5))}$$

$(kL/r)min < C_c'$, allowable compression stress, $F_a = 17.2\ ksi$

Critical ratio = $844.74\ /\ 17{,}200 = 0.049$

Results

Table 845: Comparison of results

Parameter		Hand Calculation	STAAD.Pro	Difference	Comments
Member 6 (tension)	Slenderness ratio	61.76	61.76	none	
	Actual tensile stress (psi)	352	352	none	
	Allowable tensile stress (psi)	21,600	21,600	none	
	Critical ratio	0.016	0.016	none	
Member 7 (compression)	Slenderness ratio	61.76	61.76	none	
	Actual tensile stress (psi)	845	845	none	
	Allowable tensile stress (psi)	17,200	17,200	none	
	Critical ratio	0.049	0.049	none

- *D1.L.1. ASME NF 3000 - 1974 & 1977 Codes* (on page 1310)

V. ASME NF 3000 1974 Channel

Verify the design of channel section used for a beam member using the ASME NF 3000 1974 code.

Details

The beam is a propped cantilever 80 inches long. The beam is loaded with a 2 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is C15x50 channel section with Grade A36 steel.

Validation

Maximum shear force (at fixed end): V = 51.375 kips (taken from STAAD.Pro analysis)

Maximum moment (at fixed end): M = 830.0 in-kip (taken from STAAD.Pro analysis)

Slenderness Ratio

About z-axis: $(KL/r)_z = 0.85(80\ in)/(5.25\ in) = 12.95$

About y-axis: $(KL/r)_y = 0.85(80\ in)/(0.865\ in) = 78.61$

Max. slenderness ratio < 300, OK.

Bending About Major Axis (Z Axis)

$$\frac{b_f}{t_f} = 4.62 < \frac{65}{\sqrt{F_y}} = 10.83$$

The laterally unsupported length of the compression flange, $L_b = 80 < \frac{76 b_f}{\sqrt{F_y}} = 120$

and $< \frac{20,\ 000}{(d\ /\ A_f)F_y} = 89.56$

As b_f/t_f is not in the range of $65/\sqrt{(Fy)}$ and $95/\sqrt{(Fy)}$, the value of allowable bending compressive and tensile stress = $F_{bty} = F_{bcy} = 0.6 \times F_y = 21.6\ ksi$

Actual bending stress:

Bending Tensile Stress = bending compressive stress = $f_{btz} = f_{bcz} = MzD\ /\ (2I_z) = 15.4\ ksi$

$$830.0\ (15.0)\ /\ (2 \times 404) = 15.41\ \text{ksi}$$

Critical ratio = 15.41 ksi / 21.6 ksi = 0.713

Shear

Actual shear:

$F_y = 51.375$ kips

$V_y = D \times t_w = 10.8\ in^2$

fv,y = Fy/Vy = 4.76 ksi

Allowable shear:

a = clear distance between transverse stiffeners (here taken as length) = 80 in

h = clear distance flanges of the girder = $D\text{-}2t_f = 14.35\ in$

Thus, $a/h = 5.57$, Therefore, $k = 5.34 + [4.00/\ (a/h)^2] = 5.46$

$t = t_w = 0.72$ inch

Cv =17.2

$$F_v = (F_y/2.89)C_v \geq 0.4 \times F_y = 14.4 \text{ ksi}$$

Hence allowable=14.4 ksi

Therefore, Ratio = $f_v / F_v = 0.330$

Results

Table 846: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Slenderness ratio	78.61	78.61	none

- *D1.L.1. ASME NF 3000 - 1974 & 1977 Codes* (on page 1310)

V. ASME NF 3000 1974 Pipe

Verify the design of a pipe section used for a beam member per the ASME NF 3000 1974 code.

Details

The simply supported beam is 50 inches long. The beam is loaded with a 1.5 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is PIPS 120 pipe section with Grade A36 steel.

Validation

Maximum shear force, $V = \frac{P}{2} + \frac{wL}{2} = \frac{1.5}{2} + \frac{1.0(50)}{2} = 25.75 kips$

Maximum moment, $M = \frac{PL}{4} + \frac{wL^2}{8} = \frac{1.5(50)}{4} + \frac{1.0(50)^2}{8} = 331.25 in \cdot kip$

Slenderness ratio = (KL/r) = 9.72 < 300

<u>Bending About Major Axis (Z-Axis)</u>

Section is compact: $\frac{OD}{t} = 36.43 < \frac{3,300}{F_y} = 91.67$

Allowable bending stress: $F_b = 0.66 \times F_y = 23.76\ ksi$

Actual bending stress: $f_{btz} = f_{bcz} = \frac{M_z}{I_z}\left(\frac{OD}{2}\right) = \frac{331.25}{262}\left(\frac{12.75}{2}\right) = 8.06 ksi$

Stress ratio: 0.339

<u>Shear</u>

From the reference, the shear area:

$$A_y = \frac{0.25\pi\left(r_2^4 - r_1^4\right)2\left(r_2 - r_1\right)}{\frac{2}{3}\left(r_2^3 - r_1^3\right)}$$

where

r_1	=	inner radius
r_2	=	outer radius

Shear area: $A_y = 6.8\ in^2$

Actual shear stress (at supports): $f_v = 25.75\ /\ 6.8 = 3.78\ ksi$

Actual shear stress (at midspan): $f_v = 0.75\ /\ 6.8 = 0.110\ ksi$

Allowable shear stress, $F_v = 0.4 \times F_y = 14.4\ ksi$

Stress ratio: 3.78/14.4 = 0.263

Results

- *D1.L.1. ASME NF 3000 - 1974 & 1977 Codes* (on page 1310)

V. ASME NF 3000 1974 Tee

Verify the design of a pipe section used for a beam member per the ASME NF 3000 1974 code.

Details

A cantilever beam is 60 in long. The beam is loaded at the free end with a 2 kip load and a uniform load of 1 kip/in along the entire length.

The member is a WT18x67.5 section with Grade A36 steel.

Validation

Maximum shear force (at support) = $V = wL + P = (1\ kip/in) \times 60\ in + 2\ kip = 62\ kips$

Maximum moment (at support) = $M = 0.5 \times w \times L^2 + P \times L = 0.5\ (1\ kip/in) \times (60\ in)^2 + (2\ kip) \times (60\ in) = 1{,}920\ in{\cdot}kips$

<u>Slenderness Ratio</u>

Slenderness Ratio along Z-Axis = $(KL/r)_z = 21.22$

Slenderness Ratio along Y-Axis = $(KL/r)_y = 50.53$

Maximum Slenderness Ratio = $50.53 < 300$

<u>Bending</u>

Allowable Bending Stress About Major Axis (Z Axis)

$$b_f/2t_f = 4.65 > 65/\sqrt{(F_Y)} = 10.833$$

$$d/t_w = 28.3 < 640/\sqrt{(F_Y)} = 106.67$$

Thus allowable bending stress is obtained by treating the section as compact.

$$F_b = 0.66 \times F_Y = 23.8 \text{ ksi}$$

Actual Bending Stress

Bending Tensile Stress = $f_{btz} = (Mz/Iz) \times Y_{bar} = 14.93 \ ksi < 23.8 \ ksi$

Bending Compressive Stress = $f_{bcz} = 38.7 \ ksi > 23.8 \ ksi$

Critical stress ratio = $38.7 \ ksi \ / \ 23.8 \ ksi = 1.626$

Shear

Allowable Shear Stress

a = clear distance between transverse stiffeners (here taken as length) = 60 in

h = clear distance flanges of the girder = $D\text{-}t_f = 17.01 \ in$

Thus, a/h = 3.527 Therefore, $k = 5.34 + [4.00/ \ (a/h)^2] = 5.65$

$$t = t_w = 0.44 \text{ inch}$$

If Cv > 0.8, $Cv = [190/(h/t)]\sqrt{(k/Sy)} = 78.4$ which is true. Thus, the value of Cv is taken as 78.4

Allowable shear stress = $Fv = (FY/2.89)Cv \leq 0.4F_y = 14.4 \ ksi$

Hence allowable shear =14.4ksi

Actual Shear

$$Vy = Dt_w = 10.68 \text{ in}^2$$

$$fv = Fy/Vy = 5.805 \text{ ksi}$$

Stress ratio = fv/Fv = 0.403

Results

- *D1.L.1. ASME NF 3000 - 1974 & 1977 Codes* (on page 1310)

V. ASME NF 3000 1974 WShaped

Verify the design of a wide-flange section used for a cantilever beam using the ASME NF 3000 1974 code.

Details

The beam is a 10 ft cantilever with a 12.5 kip concentrated load at the free end.

The member is a W16X40 section with Grade A36 steel.

Validation

Maximum shear force (constant shear): $V = 12.5\ kips$

Maximum moment (at fixed end): $M = 12.5\ kips \times 120\ in = 1{,}500\ in{\cdot}kips$

Slenderness Ratio

$(KL/r)_z$ = Slenderness Ratio along Z-Axis = 18.11

$(KL/r)_y$ = Slenderness Ratio along Y-Axis = 76.68

Maximum Slenderness Ratio = 76.68 < 240 (Hence OK)

Bending about Major Axis (Z Axis)

Allowable Bending Stress

$$b_f/2t_f = 6.862 < 65/(Fy)^{0.5} \text{ [Ref. NF3322.1(d)(2)]}$$

Thus, allowable bending tensile stress = $F_{btz} = Fy\times[0.79\text{-}0.002\times(b_f/2t_f)\times\sqrt{Fy}] = 25.47\ ksi$

Actual Bending Stress

Bending Tensile Stress = Bending Compressive Stress = $f_{btz} = f_{bcz} = M_zD/2I_z = 23.17\ ksi$

Stress ratio = $23.16\ ksi\ /\ 25.47\ ksi = 0.909$

Shear

Allowable Shear Stress

a = clear distance between transverse stiffeners (here taken as length) = $120\ in$

h = clear distance flanges of the girder = $D\text{-}2t_f = 14.91\ in$

Thus, $a/h = 8.05$, Therefore, $k = 5.34 + [4.00/\ (a/h)^2] = 5.36$ [Ref. NF3322.6(e)(2)]

$t = t_w = 0.3$ inch

Cv =1.475

Allowable shear stress = $Fv = (Fy/2.89)Cv => 0.4Fy = 14.4\ ksi$ Hence allowable=14.4ksi

Actual Shear Stress

Fy = 12.5 kip, $Vy = Dt_w = 4.8\ inch^2$

fv = Fy/Vy = 2.6 ksi

Stress ratio = $fv/Fv = 0.18$

Results

Table 849: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Slenderness ratio	76.68	76.68	none

- *D1.L.1. ASME NF 3000 - 1974 & 1977 Codes* (on page 1310)

V. ASME NF 3000 1977 Angle

Verify the allowable stress and critical ratio of the brace members in a frame using the ASME NF 3000 1977 code.

Details

The forces due to loading in member 6 is 2,666.18 lbs (tension) and in member 7 is 7,104.23 lbs (compression). Members 6 and 7 are “truss” members (axial-only).

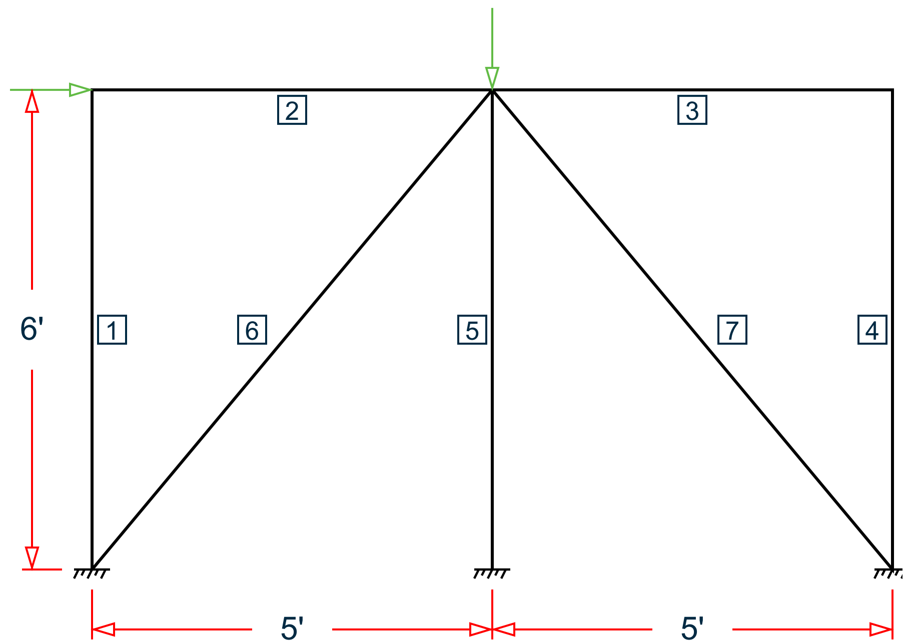

Figure 507: Space frame subjected to static loads

Both member 6 and 7 are L 80x60x10, grade A36 steel (F_y = 36 ksi, F_u = 58 ksi).

Assume a net section factor of 0.9, an effective length factor of 0.85, and C_t = 0.9.

Validation

$$L = \sqrt{5^2 + 6^2}(12\text{in/ft}) = 93.726\text{in}$$

Slenderness ratio (same for both members) using the minimum value of r: $kL/r_z = 0.85(93.726)/1.29 = 61.76$

For member 6, $kL/r_z = 61.76 < 300$

For member 7, $kL/r_z = 61.76 < 200$

<u>Axial Tension: Member 6 (per NF-77.2211)</u>

Corrected area, $A_c = C_t \times A_x = 7.57\ in^2$

Actual tensile stress = $P/A = 2{,}666.18\ /\ 7.57 = 352.2\ psi$

Allowable tensile stress (Tension capacity) = $0.6 \times Fy = 0.6 \times 36 = 21.6\ ksi$

Critical ratio = 352.2/21,600 = 0.016

<u>Axial Compression: Member 7 (NF-77.2213):</u>

Actual compressive stress = $P/A = 7{,}104.23\ /\ 8.41 = 844.74\ psi$

$$C_c' = \sqrt{\frac{2\pi^2 E}{Q_s Q_a F_y}} = 126.2 \qquad \text{(NF-3322.2(e)(5))}$$

$(kL/r)min < C_c'$, allowable compression stress, $F_a = 17.2\ ksi$

Critical ratio = $844.74\ /\ 17{,}200 = 0.049$

Results

Table 850: Comparison of results

Parameter		Hand Calculation	STAAD.Pro	Difference	Comments

V. ASME NF 3000 1977 Channel

Verify the design of channel section used for a beam member using the ASME NF 3000 1977 code.

Details

The beam is a propped cantilever 80 inches long. The beam is loaded with a 2 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is C15x50 channel section with Grade A36 steel.

Validation

Maximum shear force (at fixed end): V = 51.375 kips (taken from STAAD.Pro analysis)

Maximum moment (at fixed end): M = 830.0 in-kip (taken from STAAD.Pro analysis)

Slenderness Ratio

About z-axis: $(KL/r)_z = 0.85(80\ in)/(5.25\ in) = 12.95$

About y-axis: $(KL/r)_y = 0.85(80\ in)/(0.865\ in) = 78.61$

Max. slenderness ratio < 300, OK.

Bending About Major Axis (Z Axis)

$$\frac{b_f}{t_f} = 4.62 < \frac{65}{\sqrt{F_y}} = 10.83$$

The laterally unsupported length of the compression flange, $L_b = 80 < \frac{76 b_f}{\sqrt{F_y}} = 120$

and $< \frac{20,\ 000}{(d\ /\ A_f)F_y} = 89.56$

As b_f/t_f is not in the range of $65/\sqrt{(Fy)}$ and $95/\sqrt{(Fy)}$, the value of allowable bending compressive and tensile stress = $F_{bty} = F_{bcy} = 0.6 \times F_y = 21.6\ ksi$

Actual bending stress:

Bending Tensile Stress = bending compressive stress = $f_{btz} = f_{bcz} = MzD\ /\ (2I_z) = 15.4\ ksi$

$$830.0\ (15.0)\ /\ (2 \times 404) = 15.41\text{ ksi}$$

Critical ratio = 15.41 ksi / 21.6 ksi = 0.713

Shear

Actual shear:

$$F_y = 51.375\text{ kips}$$

$$V_y = D \times t_w = 10.8\text{ in}^2$$

$$fv,y = Fy/Vy = 4.76\text{ ksi}$$

Allowable shear:

a = clear distance between transverse stiffeners (here taken as length) = 80 in

h = clear distance flanges of the girder = $D\text{-}2t_f = 14.35\ in$

Thus, $a/h = 5.57$, Therefore, $k = 5.34 + [4.00/\ (a/h)^2] = 5.46$

$t = t_w = 0.72$ inch

$Cv = 17.2$

$F_v = (F_y/2.89)C_v \geq 0.4 \times F_y = 14.4$ ksi

Hence allowable=14.4 ksi

Therefore, Ratio = $f_v / F_v = 0.330$

Results

Table 851: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments

- *D1.L.1. ASME NF 3000 - 1974 & 1977 Codes* (on page 1310)

V. ASME NF 3000 1977 Pipe

Verify the design of a pipe section used for a beam member per the ASME NF 3000 1977 code.

Details

The simply supported beam is 50 inches long. The beam is loaded with a 1.5 kip concentrated load at midspan and a uniformly distributed load of 1 kip/in over the entire length.

The member is PIPS 120 pipe section with Grade A36 steel.

Validation

Maximum shear force, $V = \frac{P}{2} + \frac{wL}{2} = \frac{1.5}{2} + \frac{1.0(50)}{2} = 25.75kips$

Maximum moment, $M = \frac{PL}{4} + \frac{wL^2}{8} = \frac{1.5(50)}{4} + \frac{1.0(50)^2}{8} = 331.25in \cdot kip$

Slenderness ratio = (KL/r) = 9.72 < 300

<u>Bending About Major Axis (Z-Axis)</u>

Section is compact: $\frac{OD}{t} = 36.43 < \frac{3,\ 300}{F_y} = 91.67$

Allowable bending stress: $F_b = 0.66 \times F_y = 23.76\ ksi$

Actual bending stress: $f_{btz} = f_{bcz} = \frac{M_z}{I_z}\left(\frac{OD}{2}\right) = \frac{331.25}{262}\left(\frac{12.75}{2}\right) = 8.06ksi$

Stress ratio: 0.339

<u>Shear</u>

From the reference, the shear area:

$$A_y = \frac{0.25\pi\left(r_2{}^4 - r_1{}^4\right)2\left(r_2 - r_1\right)}{\frac{2}{3}\left(r_2{}^3 - r_1{}^3\right)}$$

where

r_1	=	inner radius
r_2	=	outer radius

Shear area: $A_y = 6.8\ in^2$

Actual shear stress (at supports): $f_v = 25.75\ /\ 6.8 = 3.78\ ksi$

Actual shear stress (at midspan): $f_v = 0.75\ /\ 6.8 = 0.110\ ksi$

Allowable shear stress, $F_v = 0.4 \times F_y = 14.4\ ksi$

Stress ratio: 3.78/14.4 = 0.263

Results

Table 852: Comparison of results

Parameter	Hand Calculation	STAAD.Pro	Difference	Comments
Slenderness ratio	9.72	9.72	none
